

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## BEAM

12 28 51 10 13 12

**BEAM** (Sax. *beam*, a tree), in architecture, a piece of timber, long in proportion to its breadth and thickness, used either to support a superincumbent weight, or to bind together the parts of a frame as a tie, by resistance to extension, or to hold them apart, as a strut, by resistance to compression. The term is applied particularly to the largest piece of timber in a building, that which lies across the walls and supports the principal rafters. Important improvements have been introduced within the last few years, in various departments of practical construction, by the use of iron beams, especially in the building of fire-proof structures and bridges. Prior to their introduction the only method of securing safety from fire was by massive and cumbersome constructions of masonry. This system of groined arches involves great loss of room, the most solid foundations and heavy walls and piers to sustain their weight and thrust, and often an inconvenient arrangement and division of the interior of the edifice. It is not only not adapted to the purposes of business, but its expense is such as to preclude its use for ordinary warehouses, offices, and dwellings. The immense annual destruction of property by fires demonstrates the great importance of any improvements by which security can be obtained, without excessive cost and inconvenient restrictions on the plan of the building. By the introduction of cast-iron beams and light segmental arches, these results were, to some extent, obtained; but experience has shown that wrought-iron is much better adapted to resist transverse strains, and the testimony of eminent engineers and architects is unanimous in preferring it for this purpose, as both more to be relied on and more economical. The first instance on record of the construction of a building with cast-iron beams is that of a fire-proof cotton mill erected in Manchester by Boulton and Watt, in 1801. It was not, however, until after the elaborate experiments of Mr. Hodgkinson, in 1830, upon the strength and properties of cast-iron, that the best form of section was determined, or that iron beams were used for spans exceeding 14 feet. He found the resistance of cast-iron to compression to be about 6 times as great as its resistance to

extension, and that equal strength could be obtained with half the weight of material formerly used, by giving the proper proportions to the parts subjected to these respective strains. Much, however, was still to be desired, on the score of security and economy, and numerous accidents have justified the general want of confidence in beams of cast-iron, unless great precautions are observed in casting them and properly proportioning their parts; and even when these precautions are observed, and iron of good quality is selected, security can only be obtained by making the most ample allowances for unequal shrinkage in cooling, and for hidden imperfections not apparent on the surface, or to be detected only by the most careful examination. Other objections to cast-iron beams are, that they are liable to fail without warning, especially if subjected to concussion, and to be broken by the frequent application and removal of loads, much less than the permanent load they would sustain with safety. By a system of testing, in some cases, defective beams may be detected; but in others, the load applied in the test itself may so weaken the beam that it may afterward fail with a load much less than that employed in the test, especially if it is to be subjected to concussion or repeated deflections, even though small in amount.—Wrought-iron beams have been used only within the last few years. The successful construction of the tubular bridges, in 1849, over the Conway and Menai straits—the most novel and striking achievement of modern engineering—was one of their earliest applications, and on the most gigantic scale. The laws and the amount of the resistance of wrought-iron to the various strains to which it is subjected in its application to beams, were first determined by the most careful and elaborate experiments, and the superiority of wrought-iron for this purpose clearly demonstrated. By means of the data thus obtained, Mr. Stephenson was enabled successfully to carry out his conception of using for the bridges of the Chester and Holyhead railway, tubular beams of sufficient strength and rigidity to permit the passage of the heaviest railway trains at the highest speeds. These applications of wrought-iron beams on the grand-

est scale have been followed by their more modest, but even more useful application to fire-proof buildings, whereby, at the same time, perfect security and a material reduction in the cost of fire-proof constructions have been attained. Wrought-iron is an elastic material of fibrous structure. Its ultimate strength of resistance to extension is greater than to compression, but when these strains do not exceed about one-half its ultimate strength, it offers equal resistance to either strain. Within these limits the amount of the extension or compression which it undergoes is about half that of cast-iron for equal loads; but the amount of its extension or compression, before rupture, is much greater than that of cast-iron. A wrought-iron beam will thus be more rigid than one of cast-iron, with any load that will in practice be permanently applied to it; but, unlike the latter, by its excessive deflection when overloaded, will give warning of danger before rupture can take place. This characteristic is of great importance in beams which may be subjected to impact, as the falling of a heavy weight, the resistance of the beam being in proportion not only to its strength, but also to the amount of deflection that it will undergo before rupture. The various processes of forging, rolling, &c., to which wrought-iron beams are subjected in their manufacture, will cause any serious defect to be detected. They can be used for much greater spans than beams of cast-iron, and it is often an important consideration to dispense with columns or division-walls, when large rooms are required. Their strength being about 3 times that of cast-iron beams of equal weight, while the comparative cost is in a much less ratio, they are not only more safe, but also more economical. For wrought-iron beams the most advantageous forms are the double flanché or  $\Gamma$  beam, and the box or tubular beam. Unlike those of cast-iron, the flanches or horizontal sides are usually of equal area. When lateral deflection cannot take place, there is little difference in respect to strength between these forms, the single vertical web and the horizontal flanches projecting from it, of the one, being respectively the equivalents of the 2 vertical and of the 2 horizontal sides of the other. For floor beams the  $\Gamma$  form is ordinarily employed. It is not only more economical, but has the great advantage of allowing the material of which the flooring between the beams is formed to rest upon its lower flanches, thus saving space, and surrounding and protecting the beams from the effects of fire. In the tubular beam not only do its upper and lower sides contribute to its lateral stiffness, but the vertical sides resist lateral flexure in proportion to the width of the tube, exactly as the horizontal sides resist vertical flexure in proportion to its depth, while in the  $\Gamma$  beam lateral stiffness is due principally to the flanches. A vertical load upon a beam is sustained by the resistance of its fibres to the forces of compression and extension. A

body subjected to compression, as a column, if its length be great in comparison with its lateral dimensions, will fail by bending, under a load much less than would be required to crush the material if the column were maintained in the direct line of strain. The tendency of a body subject to compression to yield by flexure being in proportion to the square of its length, while the vertical strength of a beam is in inverse proportion to its length simply, it may often happen that the limit of strength of a beam will be not its vertical but its lateral stiffness, and hence in some cases, as for girders without lateral supports, it may be advisable to use the tubular form, while for floor beams which are secured from lateral deflexion by the filling in between them, the  $\Gamma$  form is preferable. Wrought-iron beams of either form may be made by riveting together plates, angle bars, T bars, or other shapes; the rivets should always be fastened while hot in order that their contraction in cooling may draw the parts closely together. The manufacture of solid rolled beams has effected a further important reduction in the cost of fire-proof construction. This manufacture has been introduced in this country by the Trenton Iron company, at their works at Trenton, N. J. These beams have been adopted by the various departments of the government of the United States in the construction of the many custom houses, marine hospitals, and other public buildings erected since their introduction, to the entire exclusion of the system of groined arches and also of riveted beams, except in cases where solid rolled beams of sufficient size could not be obtained. This reduction in the cost of construction has also led to the erection of many fire-proof banking houses, warehouses, manufactories, &c., within the last 8 years, and the system is rapidly coming into general use. For filling in between the beams for fire-proof floors various systems have been adopted. In France, where fire-proof construction with iron beams is extensively used, the filling in is generally a concrete of refuse materials and plaster of Paris. Beams of the  $\Gamma$  form are placed  $2\frac{1}{2}$  or 8 feet apart; their ends are built in the walls and secured by anchors; no beams are placed immediately at the walls parallel with the beams. The beam next each wall is connected to it, and each beam connected with the one next adjoining, by inter-ties of round or square iron of about half a square inch in sectional area, and placed  $2\frac{1}{2}$  or 3 feet apart; the inter-ties pass through holes near the centre line of the beams, and are provided with a head at one end and riveted up at the other after they are put in; the ends that are built into the walls are bent to form anchors. Smaller rods parallel with the beams and 7 or 8 inches apart, are suspended from the inter-ties, the ends of the rods being bent up so as to hook over the inter-ties, while the rods themselves are on a level but little above that of the bottom of the beams; or the inter-ties may be supported upon the lower flanches of the beams and be bent up at the ends so as to

hook over the upper flanges, and the smaller rods parallel with the beams be laid upon the inter-ties. A flat centring is placed against the bottoms of the beams, and broken bricks or other refuse materials suitable for concrete are put upon the centring, and plaster of Paris being poured in, the whole mass soon becomes sufficiently set to allow the centring to be removed, and the concrete to be sustained by the iron framework between the beams. In some cases the plaster concrete fills up the whole space between the beams, and flooring tiles are laid directly upon it; in others the depth of the concrete is less than that of the beams, and wooden strips are laid across the beams perpendicular to their length, to which ordinary flooring boards are nailed. A finishing coat of plaster put directly on the concrete forms the ceiling below. Hollow potteries placed upon the iron lattice work, with the interstices filled with plaster, are frequently used instead of concrete. A very light and superior floor is thus made, and the rigidity of the whole system considerably increased. The load to be sustained by the floors for dwellings, offices, and buildings other than manufactories and warehouses for the storage of heavy goods, is assumed at 150 pounds per square foot. In a crowded room each person will occupy not less than  $2\frac{1}{2}$  square feet, and will have an average weight of 150 pounds, and adding 15 pounds for the weight of the floor itself, the total load will be 75 pounds per square foot. The estimated load of 150 pounds per square foot is obtained by taking double the actual load to allow for vibration from walking, dancing, and accidental shocks. The following table gives the spans, weights, and depths of the joists used in the floor of the Louvre, the load being taken at 150 pounds per square foot, and the condition maintained that the deflection at the middle of any beam shall not exceed  $\frac{1}{4}$  of an inch. A chamber is given to the beams sufficient to prevent any deflection below a horizontal line.

Spans.	Weight of beams per yard.	Depth of beams.
6' 7"	18 lbs.	4 inches.
9' 10"	32 "	4 "
12' 2"	40 "	5 "
16' 5"	50 "	6 "
18' 1"	54 "	7 "
21' 5"	60 "	7 "
25'	76 "	8 "

On testing these floors it was found that a much greater load than 150 pounds per square foot could be applied without straining the beams beyond the elastic limit of the iron, and that consequently any additional deflection they might take under such load would disappear upon its removal. For spans of greater length than 25 feet, riveted beams are made with two T bars, to form the flanges, and two plates of boiler iron of the requisite width riveted one on each side of the stems of the bars. Plane plates of iron have also been used for beams with the system of inter-ties, and concrete, or potteries, above described. A much greater weight of iron is required to obtain the same

strength than when T bars of equal depth are employed, and the system has been abandoned on account of its greater cost and inferior efficiency.—The use of plaster for the filling in between the beams has not been adopted in England or America, because of the greater cost and inferior quality of the plaster that can be obtained. The system known as that of Fox and Barrett has been used extensively in England. Light strips of wood with narrow spaces between them are supported on the bottom flanges of the beams, and reach from beam to beam. On these strips is spread a layer of coarse mortar which is pressed down between them. Concrete, made with cement, is filled in between the beams, and a tile or wooden floor is laid immediately upon it. A rough and a finishing coat of plaster are put directly on the cement to form the ceiling below. Floors have also been made by the use of arched plates of wrought-iron or of corrugated sheet-iron supported upon the lower flanges of the beams, with a filling of concrete above the arched plates or corrugated iron on which the floor is laid. The system of light segmental brick arches springing from the lower flanges of the beams and levelled up with concrete is that most generally employed in this country and in England. It is more strictly fire-proof than any other, and much more economical than the use of arched plates or corrugated sheet-iron, and, except in France, where plaster is cheap, than the French systems. The weight of the floors themselves with a filling of solid concrete or brick arches forms a much greater part than in the lighter French systems, of the total load to be carried by the beams; but on the other hand the arches and concrete add materially to the strength and rigidity of the beams, not only by preventing lateral deflection, but by adding to some extent the resistance to compression of so much of the arches or concrete as is above the neutral line to that of the upper parts of the beams, whereby they become in fact an integral part of the beams themselves. The neutral axis is thus brought nearer the upper side of the floor, and the lower parts of the beams act with greater leverage to resist extension. Only so much of the filling in as is above the neutral line thus adds to the strength of the beams, and in order that this additional strength may be obtained, the filling must not slide along the beam, as it suffers deflection under the load. The weight of the floor is not only less with arches than with solid concrete, but the filling also contributes more effectually to the strength of the system. Long beams should be supported in the middle of their length by wooden scantlings until the cement of the arches or concrete is set, in order to get the full advantage of this additional resistance, which in many cases amounts to 25 per cent. of that of the beams. The arches should have a rise of not less than one inch to the foot of span, and are generally the width of a brick in thickness, unless the spans exceed 6 or 8 feet, when they

should be 8 inches at the soffit and  $4\frac{1}{2}$  inches at the crown. If a wooden flooring is to be used, wooden strips parallel with the beams are laid in the concrete filling above the arches, to which the flooring can be nailed. To form the ceiling below the beams wooden strips may be secured to the lower flanches of the beams, to which ordinary furring, lathing, and plastering can be nailed; or the plaster may be put directly upon the arches, so as to show the system of construction, and thus with suitable mouldings a good architectural effect can be obtained. The thrust of the arches on one side of the beams is counteracted by the thrust on the other side, except for beams next the walls or openings. It is usual in order to counteract the thrust on these beams to connect together several of the beams next a wall or opening, by tie rods perpendicular to their length. In some cases also the ceiling and floor have been formed by blocks of stone resting upon the lower flanches of the beams with ornamental designs cut upon the lower face.—The strength of various forms and dimensions of beams may be determined by the ordinary formulæ of resistance. For spans of less than 25 feet solid rolled beams 9 inches deep are usually employed, or often for small spans beams 7 inches deep. The beams are placed at such distances apart as may be necessary to give the requisite strength for the load and span required. For beams of greater span than 25 feet solid rolled beams of sufficient depth cannot yet be obtained, but the increasing demand will probably soon lead to their manufacture. For larger spans, riveted beams are used, and floors with wrought-iron beams and brick arches have been constructed for clear spans of 60 feet. Where the width of the building is great, it is more economical to divide the width into two or more spans by the introduction of columns and girders. I beams may be used for girders, but in most cases hollow box girders are to be preferred.

BEAN, an annual plant of the natural order of *leguminosæ*, and sub-order of *papilionaceæ*, of which the principal species is the *faba vulgaris*, the bean commonly cultivated in England, America, and also on the continent of Europe. The French haricot, or kidney bean, is the only other kind cultivated, though there are wild species in India and South America, which are important articles of diet to the natives. The generic characteristics of the common bean are a straight simple stock from 1 to 2 feet in height, leaves formed of 4 thick, entire, ovate-oblong leaflets, white flowers with a dark silky spot in the middle of the 2 lateral petals, pods divided into partitions and containing 5 or more seeds or kernels, whose size, shape, and color differ considerably in the different varieties of the species. Of these varieties, the mazagan is the earliest and has the smallest seeds, the Windsor has the largest and almost orbicular seeds. There is also the highly esteemed dwarf bean, with a very small seed, and the horse-bean, with a long and cy-

lindrical seed, designed chiefly for the food of cattle. Beans love a rich strong loam, but they do not exhaust the soil, and are often planted advantageously in company with other seeds, particularly with maize. They make a very nutritious food, containing 84 per cent. of nutritive matter, and are healthful to those whose stomachs are strong and able to digest them. Baked beans are a favorite dish throughout New England. There is said to be no other food on which men can do so hard work. Hence they are especially esteemed by farmers, during the laborious haying season, and are the most popular article of diet among the lumberers of Maine and Wisconsin.—The bean is a native of Persia, and of the borders of the Caspian sea. According to Diodorus Siculus, the Egyptians were the first to cultivate it, and to make it a common article of diet, yet they conceived religious notions concerning it which made them at length refrain from eating it. Their priests dared not either touch it or look at it. Pythagoras, who was educated among the Egyptians, derived from them their veneration for the bean, and forbade his disciples to eat it. He taught that it was created at the same time and of the same elements as man, that it was animated and had a soul, which, like the human soul, suffered the vicissitudes of transmigration. Aristotle explains the prohibition of Pythagoras symbolically; he says that beans being the ordinary means of voting on public matters, the white bean meaning an affirmative, and the black a negative, therefore Pythagoras meant to forbid his disciples to meddle with political government. The Roman priests affirmed that the bean blossom contained infernal letters, referring to the dark stains on the wings, and it is probable that all the superstitions on the subject sprang from the blossom and not from the fruit.

BEAN GOOSE (*anas segetum*), a variety of the common European wild goose, neither of the species being known to America. Some persons have believed the bean goose to be the origin of the common domestic goose; but that distinction is generally assigned to the gray lag geese, or common wild goose, which closely resembles the ordinary domestic fowl, except that the ganders are plain gray, like the geese, which, in the wild birds, are never pied; the white mottling being the effect of domestication.

BEAR (*ursus*). "The family of bears are classed," says an agreeable writer, Robert Muir, in his "Gleanings from Nature," "by the late truly illustrious Baron Cuvier, among those carnivorous animals which are plantigrade, or walk upon the soles of their feet. They differ from the more typical carnivora in many respects. In the first place, they do not confine themselves to animal food, but eat succulent vegetables, honey, and other substances which are not animal; in the second place, they do not kill the animals which they eat in what may be called a business-like manner, by attack-

ing them in some vital part, but, on the contrary, hug or tear them to death; and, in the third place, those of them that inhabit the cold climates, which are their appropriate places of residence, often hibernate during the winter, or some part of it, which is never done by the characteristic carnivora. There are bears in almost all latitudes, from the equator to the pole; but those which inhabit the warmer latitudes are tame and feeble as compared with the natives of the cooler ones; and, therefore, we must regard them as being, in their proper home and locality, animals of the colder regions of the globe. The whole genus has, in fact, a polar rather than an equatorial character, and may thus be considered as geographically the reverse of the more formidable of the strictly carnivorous animals—the lion and tiger in the eastern, and the jaguar in the western hemisphere. These are all tropical in their homes, habitually ardent in their temperaments, and, though they can endure hunger for considerable periods, they feed all the year round, and thus have no season of repose. The bears, again, are seasonal animals, retiring during the winter, and coming abroad in the spring. But it is not from the storm that the bears retire; it is from the cold serenity—the almost total cessation of atmospheric, as well as of living action—which reigns during the polar winter; the storm is both seed-time and harvest to the bears. During its utmost fury, they range the wilds and forests, accompanied by the more powerful owls and hawks, which, like the bears, are equally remarkable for their strength and their impenetrable covering. At those times, many of the smaller animals are dashed lifeless to the earth by the storm, or shrouded in the snow, and upon these the bears make an abundant supper—a supper of days, and even of weeks—before they retire to their long rest. So also, when the storm begins to break, they find a plentiful collection of the carcasses of such animals as have perished in the snow, and been concealed from sight and preserved from putrefaction under it.” —The polar bear (*U. maritimus*), is the largest, strongest, most powerful, and, with a single exception, the most ferocious of the five species of the bear which have been distinguished by naturalists. Its distinguishing characteristics are the great length of its body, as compared with its height; the length of the neck; the smallness of the external ears; the large size of the soles of the feet; the fineness and length of the hair; the straightness of the line of the forehead and the nose; the narrowness of its head, and the expansion of its muzzle. It is invariably of a dingy white hue. The size varies considerably. Some are mentioned as long as 18 feet; but this is probably an exaggeration. Captain Lyon mentions one of 8 feet 7 inches long, weighing 1,500 pounds. The domestic habits of these powerful animals are not much understood; and the fact of their hibernating or not is not very well ascertained, although it is believed that the male, at least, is not dormant so

long as the land bears of the north. The admirable work of the late excellent Kane seems to place it in doubt whether either sex absolutely hibernates, as we find she-bears with their cubs visiting his winter quarters during the midnight darkness. The pairing season is understood to be in July and August; and the attachment of the pair is such, that if one is killed, the other remains fondling the dead body, and will suffer itself to be killed rather than leave it. The same wonderful affection of the female to her cubs has been noticed, from which neither wounds nor death will divide her; and all the arctic navigators, from Dr. Scoresby to Dr. Kane, have recorded their sympathy with, and regret for the poor savage mothers, vainly endeavoring to persuade their dead cubs to arise and accompany them, or to eat the food which they will not themselves touch, although starving—even when compelled to slaughter them in order to supply their own necessities. The habits of the polar bear are purely maritime; and, although their system of dentition is the same with that of the other bears, their food, from necessity, is wholly animal. The polar bear is comparatively rare in menageries, as it suffers so much from the heat, even of our winters, and from the want of water, that it is not easily preserved in confinement. In the reign of Henry III., of England, however, it is curious to record that a white bear was among the collection of wild beasts in the tower of London, for which the sheriffs of the city were ordered to provide a muzzle and an iron chain, to secure him when out of the water, and a long and stout cord to hold him when *fishing in the Thames*. The words italicized seem to identify the species beyond the possibility of error; but one would like to know whence the polar bear was brought, at that early day, so long previous to the commencement of arctic exploration.—The next bear, in all respects, to the polar species, and superior to him in ferocity and tenacity of life, is the grisly bear (*U. horribilis*) of America. This terrible and powerful animal, which is to the American fauna what the Bengal tiger is to that of Hindostan, and the lion to that of central Africa, is of comparatively late discovery, having been first distinguished by Lewis and Clark in their western explorations. Its geographical range is from the great plains west of the Missouri, at the foot of the Rocky mountains, through Upper California, to the Pacific ocean. Its characteristics are strongly marked and clear. “The line of its forehead and muzzle is straighter than in any other species; and its claws, especially those of the fore-feet, are much more produced, and far more crooked, though its general habit is not that of a climber. The snout is black and movable, the central furrow being distinct; the lips are partially extensible; the eyes very small, having no third eyelid, and the irides being of a reddish brown. The ears are short and rounded, and the line of the forehead thence to the eyes is a little convex;

but it continues straight to the point of the snout. The hair on the face is very short; but on the body, generally, it is long and very thickly set. The hair, in the adult, is a mixture of brown, white and black. The tail is short, and, in the living animal, completely hidden by the hair. On the fore paws, the claws are rather slender, but long, as well as crooked and sharp at the tips, though the sharpness is rather that of a chisel, by being narrowed at the edges, than a point. This structure gives the tips of them great additional strength, and accounts for the severe gashing wounds which are inflicted by their stroke. The soles of the hind feet are in great part naked, and the claws on them are considerably smaller than those on the fore-paws, though much more crooked; and their trenchant points form very terrible lacerating instruments, when the animal closes with its enemy in hugging. They are sufficient to tear the abdomen, even of a large animal, to shreds, while the fore-paws are at the same time compressing the thorax to suffocation." The grisly bear is the most savage of all his race. If it be not certain that he will voluntarily attack a human being, it is certain that he will not turn out of his way to avoid him, and that if attacked he will pursue the assailant to the last, nor quit the conflict while life remains. He is, also, the most tenacious of life of all animals. One shot by Gov. Clark's party, after receiving 10 balls in his body, 4 of which passed through his lungs and 2 through his heart, survived above 20 minutes, and swam half a mile, before succumbing to his wounds.—Beside these species, we must also mention the European brown bear (*U. arctos*), and the American black bear (*U. Americanus*). These 2 species are closely allied and are very similar in habits, although the European brown bear is fiercer and more sanguinary, especially as he grows old, when he will, though rarely, attack men; particularly if he have once tasted human blood, when, like the man-eating tigers and lions, he acquires a taste for it, and makes man his especial prey. They are both excellent climbers; passionately fond of honey; great devourers of roots, green wheat, and, in America, green maize; and especial enemies to hogs and young calves; which amiable propensities draw on them the marked vengeance of the backwoodsman. The brown bear is distinguished by the prominence of his brow, above the eyes, which is abruptly convex, with a depression below them—the black bear, by the regular convexity of its whole facial outline, from the ears to the muzzle. It never attacks man, except in self-defence, and then only when hard pressed and cornered. The flesh of the black bear is very good, resembling pork with a peculiar wild or perfumed flavor.—The Asiatic bear (*U. labiatus*), so called from its long lips, is a timid, inoffensive creature, ordinarily—though it, too, will fight fiercely, when wounded, or in defence of its young. It inhabits the high and mountainous regions of India, burrows in the earth,

feeds on ants, rice, and honey, and lives in pairs, together with its young, which, when alarmed, mounts the back of the parents for safety. The habits of this bear are well described in the "Old Forest Ranger," by Maj. Walter Campbell, an English officer; although the ferocity of the animal appears to be somewhat exaggerated in his accounts, notwithstanding that it is represented as fighting in defence of its young.—Three or four other species of bears, principally Asiatic, have recently been distinguished, but all of very inferior interest to those above specified, and one, at least, of extremely doubtful authenticity as a distinct species. This is the Siberian bear (*U. collaris*), which is so nearly identical with the common black bear (*U. arctos*), as to be distinguished from it, only, by a white or grizzly collar encircling its shoulders and breast—which may be, and probably is, a mere casual variety. It is said to be peculiar to Siberia.—The spectacled bear (*U. ornatus*), a native of the Cordilleras of the Andes, in Chili. Its fur is smooth, shining, and black, with the exception of a pair of semicircular marks over the eyes, whence its name, and the fur on its muzzle and its breast, which is of a dirty white color; little or nothing is known of its habits.—The Thibetian bear or Isabel bear (*U. Thibetanus*). Its characteristics are the shortness of its neck and the straightness of its facial outline. Its color is black, with a white under lip, and a white mark in the shape of a letter Y, the stem lying on the middle of the breast, the arms diverging upward on the shoulders. It is a small-sized, harmless, and purely vegetable-eating animal.—The Malay bear (*helarctos Malayanus*). A small bear, jet black, with a lunar white mark on its breast, and a yellowish muzzle. It has a long, slender, protrusive tongue, unlike that of the bears. It is perfectly inoffensive, feeding on honey and the young shoots of the cocoanut trees, of which it makes extreme havoc. When domesticated it becomes exceedingly tame, is sagacious, intelligent, and affectionate, and will not touch animal food.—The Bornean bear (*H. eurypilus*). It differs from the above, by having a large orange-colored patch on the chest. It does not exceed 4 feet in length, and has the same long, slender, protrusive tongue of the species last described, fitting it especially to feed on honey, which, with fruits and vegetables, is its sole food.—There has always existed a doubt as to the existence of any species of bear in Africa. Pliny mentions that, in the consulship of M. Piso and M. Messala, 62 B O., Domitius Enobarbus exhibited 100 Numidian bears, and as many Ethiopian hunters, in the circus, but at the same time asserts that there are no bears in Africa. Herodotus, Virgil, Juvenal, and Martial all speak of Libyan bears, as a well-known animal. Yet Bruce distinctly insists that there is no bear in any part of Africa. Ehrenberg and Forskal both, recently, speak of a black, plantigrade animal called by the natives *kawai* or *karras*, with a lengthened muzzle,

which they both saw and hunted, but in vain. It is, however, a good rule in natural history to adopt no animal on hearsay, or until a specimen is produced. On this view it must be held that there is no African bear—although there is no reason why there should not be—until one shall be produced and described.—Bear-baiting with mastiffs was formerly a favorite and even royal amusement in England; and the readers of Kenilworth will remember the characteristic scene, in which Essex is represented as pleading, before Elizabeth, the cause of the bear-warden against the stage players, Raleigh defending the latter, and quoting the passage of Shakespeare, personifying the queen as “a fair vestal throned in the west,” on which she suffers the bearward’s petition to drop unheeded into the Thames—although, in truth, it may be doubted whether the royal virago would not have in her heart preferred a tough match of “pull dog! pull bear!” to all the “wood notes wild” that Shakespeare ever warbled. In the north of Europe the brown bear is hunted in the winter, with snow shoes, and shot without the aid of dogs. In the west and south-west of the United States, he is systematically chased with packs of hounds bred for the purpose—a cross generally of the large slow foxhound with the mastiff—and the sport is described as highly exciting, and by no means devoid of danger, when Bruin turns to bay, and it becomes necessary to go in with the knife, to close quarters, in order to save the lives of the bear-hounds.

BEAR, GREAT (*ursa major*), a brilliant constellation of the northern hemisphere of the heavens. It must have been, from its noticeable character, one of those clusters which early attracted the attention of star-gazers. It is a constellation which, in the latitude of 45° N., never passes below the horizon. The most remarkable stars in it are 7 (marked by astronomers with the first 7 letters of the Greek alphabet), which, from their peculiar arrangement, have long been designated collectively by some name. They have been called the “wagon,” “Charles’s wain,” and the “dipper.” Four of them are arranged in an irregular square, constituting the body of the “dipper,” while the other 3 are nearly in a straight line, and form the handle. Two of the stars in the body of the dipper range nearly with the north star, and are therefore called the “pointers.” Mizar, in the handle, is a double star. Benetnasch is a brilliant star of the first magnitude, according to some maps; in others it is set down at 1½.—The LESSER BEAR (*ursa minor*) is a constellation of the northern hemisphere, having in it a cluster somewhat resembling the dipper in *Ursa Major*. In *Ursa Minor* there are no stars larger than the third magnitude.

BEAR (BEER) ISLAND, an island about 6 miles long by ½ broad, in Bantry bay, on the S. W. coast of Ireland. It is separated from the mainland, on the N., by a narrow frith, over

against which stands a spur of the Cahoon mountains. The surface of the island is rough.

BEAR LAKE. This body of water (called Great Bear lake) is so named on account of its situation directly under the arctic circle, and therefore under the constellation *Ursa Major*. It is of very irregular shape, having 5 arms projecting out of the main body. Its greatest diameter is 150 miles. Its depth is not ascertained. Two hundred and seventy feet of line gave no bottom near the eastern shore in M’Tavish bay. The principal supply of the lake is Dease river, which enters it from the N. E. Its outlet is, on its south-western extremity, at the bottom of Keith bay, through Bear Lake river, which empties into Mackenzie river. The surface of Bear lake is not more than 200 feet above the Arctic ocean; consequently, its bottom must, like many of the north-western lakes, lie considerably below the level of the sea. Great Bear lake abounds in fish of many varieties, among which the herring-salmon is noted. The 2d land expedition, under Franklin, in 1825, wintered on the western shore of this lake, near its outlet, where they built Fort Franklin. Dr. Richardson, a member of the expedition, mentions a curious circumstance concerning the singing birds of this lake, that when they first appeared after the long arctic winter they serenaded their mates at midnight, and were silent during the day. The waters of the lake are so clear that a white substance can be distinctly discerned at the depth of 90 feet. This lake is situated about 250 miles E. of the Rocky mountains, about the same distance S. of the Arctic sea, and 400 miles N. W. of Slave lake. It is in lat. 66° N. and long. 120° W. (Gr.), and 4° S. and 23° W. from the magnetic pole, as determined by Ross, in 1881. It is the basin of a water-shed of about 400 miles diameter.

BEAR MOUNTAIN, a mountain in the N. E. corner of Dauphin co., Penn. at the foot of which runs the creek and valley of the same name. This valley is one of the famous localities of the anthracite coal, and belongs to what writers on this subject designate as the first or southern coal district of Pennsylvania.

BEAR RIVER. Two rivers bear this name, deserving of mention. I. A river in Utah territory, about 400 miles long, which rises in a spur of the Rocky mountains, about 75 miles E. of Great Salt lake, takes first a north-westerly and then a south-easterly direction, forming nearly a letter V, of which more than half the entire length is in Oregon territory, and finally empties into the Great Salt lake. Its valley is about 6,000 feet above the sea level. At the bend of the river in Oregon, and about 45 miles from Lewis river, are found the famous Beer and Steamboat springs, which Col. Fremont describes in his expedition to Oregon and California (1842-’8), and near which he encamped. These springs are highly impregnated with magnesia, and other mineral substances. The valley of Bear river is narrow through most of its extent, but is described by Col. Fremont as ex-

tremely picturesque in many parts. Steam-boat spring is thus described: "A white column of scattered water is thrown up to a variable height of about 8 feet . . . accompanied by a subterranean noise. . . . It is a hot-spring, and the water has a pungent and disagreeable metallic taste, leaving a burning effect on the tongue." II. A river in California. It rises on the western slope of the Sierra Nevada, runs W. and S., forming the boundary, for some distance, between Yuba and Placer counties, and finally discharging its waters into Feather river, below Marysville.

BEARD, the hair which grows on the chin and lower parts of the human face. That portion, however, which is found on the upper lip is generally distinguished as the mustache, while that upon the sides of the face is known by the name of whisker. Although the beard is ordinarily only seen on the male adult, it appears occasionally in certain exceptional cases on the faces of women and children. Bearded infants and "bearded ladies," who are genuine *lusus nature*, have been not unfrequently exhibited at our public museums and show places. Historians mention a Swedish woman who concealed her sex and was enrolled among the grenadiers of Charles XII., and Margaret, duchess of Parma, regent of the Netherlands under Philip II., wore a long mustache on her upper lip. The utility of the beard has been discussed in all ages, and though its functions are not yet understood fully, it seems to have been placed as a vigilant sentinel around the mouth, like the eyelashes around the eyes. The Orientals, it has been remarked, shave the cranium and wear the beard, and ophthalmia is more common among them than loss of teeth. The Europeans retain their hair but shave their beard, and loss of teeth is more frequent among them than ophthalmia. "Thou shalt not mar the corners of thy beard," the command of Moses to the Jews, which is to be found in Leviticus xix. 27, is the first mention that learned men have been able to find in regard to the growth of the beard. This command indicates the early cultivation of the beard among eastern nations, by whom it has been always, and continues to be, held in great respect. We read in the Chronicles that the ambassadors of David having been shaved by order of the king of the Ammonites, the royal prophet sent them to Jericho to conceal their disaster, and to wait for their beard to reappear. The fact that the ancient Egyptian pictures frequently represent the human male figure, especially when of a king or dignitary, without the beard, would seem to indicate that it was a mark of rank to be devoid of that appendage. In ancient India, Persia, and Assyria, however, the beard was allowed to grow long, and was always esteemed a symbol of dignity and wisdom. The sculptures taken to England from Nineveh, and also the reliefs from Persepolis, prove that the races inhabiting those cities wore their beards. Among the modern natives of the East, the same prac-

tice obtains, although with variations in different countries. The Turks, for example, let the beard grow in full luxuriance, while the Persians give only free scope to that upon the upper lip, and cut and trim that upon the chin and the sides of the face, according to fashion or caprice. In Turkey the slaves of the seraglio are shaved, to indicate their servile inferiority to their full-bearded masters. In fact it is considered an infamy, by the Turks, to have the beard cut off, and such is the affection cherished for it, that wives in kissing their husbands, and children their fathers, put their lips to the beards. The Chinese even, who are almost destitute by nature of beard, are said to hold this portion of the hair in such esteem that they occasionally make up for the natural deficiency by an artificial substitute. All the oriental people are accustomed to swear by their beard, and are unable to conceive of a great man without this magnificent attribute. The greatest astonishment of the Egyptians in seeing Napoleon was to find him beardless. Among the classical nations of antiquity, the wearing and shaving of the beard seemed, as in more modern times, to have fluctuated with the caprices of fashion. Previous to the reign of Alexander the Great, the Greeks wore beards, but during the wars of that bellicose monarch they commenced shaving, the practice having been suggested, it is said, by Alexander for the military purpose of depriving their enemies of an opportunity of catching the soldiers by the beard, in the course of the tug of war. The fashion thus begun continued until the reign of Justinian, when long beards became again fashionable. The wise men of Greece were particularly tenacious of this appendage, and "bearded master" became almost a synonyme of philosopher. Diogenes was accustomed to ask the shaved Greeks whether they repented of their manhood.—The year 454 B. C. is given as the period when the Romans first commenced the practice of shaving, and we have the authority of Pliny for the statement, that Scipio Africanus was the first of the Romans who submitted to the daily razor. The antique busts and coins prove that the Roman emperors shaved until the time of Hadrian, who is said to have let his beard grow, for the same reason that George IV. wore a high stock, to conceal an ugly scar. The philosophers, though, from the earliest periods seem to have affected the full-grown beard, by whom it was esteemed, as among the Greeks, a symbol of wisdom; and even during the prevailing imperial fashion of shaving, the emperors would occasionally let their beards grow as a mark of grief. Both the orators and Roman poets do honor to the beard, as for example, Homer to the white one of old Nestor, and Virgil to that of Mezentius.—All the ancient inhabitants of Europe wore beards, at the earliest period of which any record exists. The fashion, however, seems to have varied with them subsequently at different times. The Lombards or Longobards de-

rived their name from the practice of going unshaved. We learn, on the authority of Tacitus, that the ancient Germans cultivated the beard from its first growth until they had killed an enemy in battle, and on the authority of Julius Cæsar that the Britons merely allowed the mustache to grow. Until the introduction of Christianity the Anglo-Saxons all wore beards without distinction, but then the clergy were compelled by law to shave. A writer of the 7th century complains that the manners of the English clergy were so bad that they could not be distinguished from the laity by their actions, but only by their want of beards. The English princes, till the conquest of William I., were in the habit of wearing mustaches, and they felt it to be a very great indignity when the Conqueror compelled them to cut them off, in accordance with the Norman fashion. The practice and precepts of the Christian fathers, who denounced shaving as a violation of the law of God, made the wearing of the beard, during the early mediæval centuries, a distinguishing fashion of the continental kings, nobles, and dignitaries. Royal personages were in the habit of weaving gold with the beard, or ornamenting it with tags of that precious metal. King Robert of France was remarkable for the possession of one of the whitest and longest beards of his day. Of long beards, however, one of the most wonderful was that of a German artist of the name of John Mayo, who was called John the Bearded in consequence. It reached the ground when he stood up, and he was consequently obliged to tuck it into his girdle. The letters proceeding from kings often received an additional sanction by containing in the seal 8 hairs of the sovereign's beard.—The separation of the Greek from the Latin church, which began in the 8th century, was the signal for great perturbations in the toilet of the face. Till then, the popes, emperors, nobles, and, except in England, the priests, had scrupulously abstained from the use of the razor. Leo III., to distinguish himself from the patriarch of Constantinople, removed his beard, and presented to astonished Christendom the spectacle of a shaved pope. Thirty years later, Gregory IV., pursuing the same system, fulminated a bull enjoining penalties upon every bearded priest. In the 12th century the prescription which had laid bare the chins of all the clergy was extended also to the laity, and even to monarchs. Godefroi, bishop of Amiens, refused the offerings of any one who wore a beard. A preacher directed his eloquence against the hirsute King Henry I. of England, and the obedient monarch gave himself into the hands of a barber. The proud Frederic I., called Barbarossa, offered a similar example of resignation. The reluctant kings of France were at first shaved by bishops, and the confessor of Louis the Young refused him absolution till he submitted to lose his beard. This reign of terror was not of long duration. In the 13th century Pope Honorius III. in order

to conceal a disfigured lip allowed his beard to grow, and inaugurated anew the fashion which became prevalent in Europe in the age of Francis I. The right of the clergy to wear their beards was then again disputed. Francis imposed a heavy tax upon every bearded bishop, and in 1561 the college of the Sorbonne decided, after mature deliberation, that a beard was contrary to sacerdotal modesty. It is related that Guillaume Duprat, returning from the council of Trent to his bishopric of Clermont with a beard that would have done honor to venerable Priam, reaching down even to his girdle, was met at the door of his church by the dean of the chapter, well supported, and brandishing a large pair of scissors. There was but one alternative, and Duprat threw off his surplice and departed, declaring that he would save his beard though he lost his bishopric. The golden age of the beard in France was the reign of Henry IV., when its various styles were distinguished as the pointed beard, the square beard, the round beard, the aureole beard, the fan-shaped beard, the swallow-tail beard, and the artichoke-leaf beard.—The dignity of the beard in England at this period may be inferred from this incident just previous to the execution of Sir Thomas More. As that great man was about being beheaded, perceiving that his beard was so placed that it would not fail to be injured by the axe of the executioner, he drew it aside saying: "My beard has not been guilty of treason; it would be an injustice to punish it." During the reign of Queen Elizabeth the beard was worn generally by those of higher rank, and was trimmed in a style distinctive, more or less, of each class. The bishop had his beard cut in a peculiar way, and we find its form still preserved in the bands of lawn now worn by the modern ecclesiastic. The soldier and the judge, too, each had his particular fashion of wearing the beard. Taylor, the water poet, quaintly alludes to these variations in the following distich:

The barbers thus (like tailors) still must be  
Acquainted with each cut's variety.

The fashion of wearing the beard began to decline subsequently to the reign of Queen Mary, and at the time of the restoration of Charles II., there was no hair worn upon the face but the mustache, which, however, was luxuriantly cultivated by the courtiers and gallants of those days. The decline of the beard in France dates from Louis XIII., and in Spain from the accession of Philip V. The Russians clung tenaciously to their beards, until Peter the Great, returning from his European tour, came home with his determined passion for reform. One of his first edicts toward the compulsory civilization of his people, had reference to the beard. He taxed this appendage, and moreover, as his subjects seemed disposed to keep their beards at any expense of money, he made a more direct appeal to their feelings, and ordered all those he found bearded to have the hair plucked out with pincers or shaven with a blunt razor.

This resolute monarch finally succeeded in smoothing the face of every subject in his dominions. Thus the practice of shaving became almost universal in Europe until within a few years. France was the first to return to the old fashion of wearing the beard, and for a while it was the distinctive mark of the Frenchman. The Briton, with his usual tenacity of habit, was the last to move, and it was only when the utility of the beard was made manifest, that he was willing to assume it. In the United States the change occurred about the same time as in Great Britain, and now the practice is becoming very general in both countries.—While in every age the beard has been subject to the caprices of fashion, it may be remarked that in art it has been uniformly ascribed to Jupiter, Brama, and other representations of divinity, while among men it has been very generally a characteristic of the sage and philosopher. Apart from good taste, which would seem to inculcate the preservation of what is an essential characteristic of the manly form, there are certain practical advantages to be urged in favor of the beard. In some employments, as in that of the steel grinders, where an irritating dust and small particles of hard material are in danger of being inhaled, and thus producing inflammation of the lungs, the wearing of the beard is found to be an important safeguard. Accordingly, steel grinders, railroad engineers and firemen, stone cutters, and all those thus exposed, have almost unanimously given up shaving. A change which has thus been inaugurated among practical working people for purposes of health and convenience, is likely to be lasting, and it is probable that before long we shall return to our primitive and national character as a bearded people.

**BEARD, JOHN**, a celebrated English singer and actor, born in 1716 or 1717, and died in 1791. He first acquired distinction by the manner in which he sang Galliard's hunting song, "With early horn." He afterward appeared as an actor at Covent Garden and Drury Lane. In 1758 he performed Macheath for 52 successive nights, with Miss Brent as Polly. Beard married the only daughter of the earl of Waldegrave, in 1789. His voice was a beautiful tenor, and he was especially distinguished as a singer of Handel's compositions.

**BEARING**, in navigation and surveying, signifies the angle made by any given line with a north and south line. The bearing of an object is the direction of a line from the observer to that object.

**BÉARN**, formerly a county and duchy in southern France, now the eastern portion of the department of Basses-Pyrénées, stretching from the snow-covered peaks of the mountains, and rapidly descending into a hilly landscape, is well watered, and excellently adapted for raising cattle and horses. The population is comparatively very large, of Basque descent, speaking the Basque tongue to this day, and understanding little French; energetic, industrious,

and freedom-loving. They produce iron and iron fabrics, flax and linen goods, cattle, horses, wine, and grain, for export as well as home consumption, and have withal spare hands enough to send annually hundreds of vigorous youths to work in the northern provinces of Spain as manufacturers, or further south as water-carriers, who return with their earnings to spend them at home. The capital is Pau. The first feudal possessor of the whole of Béarn, called Centullus, is mentioned in the 9th century, whose descendants, in the male line, with short interruptions, swayed it up to 1800, when it fell into the hands of the neighboring counts of Foix, by marriage, and by the female line of this house into the hands of the kings of Navarre, by the last of whom, Henry IV., it was united with France, though the act of annexation was not finally accomplished till 1620. Pop. about 190,800.

**BEARS AND BULLS**, terms first applied in the London exchange to speculators in stocks. Two parties having contracted, the one to deliver and the other to take stocks at a future time at a specified price, it is the interest of the delivering party, in the intervening time, to depress stocks, and of the receiving party to raise them. The former is called a bear, in allusion to the habit of that animal to pull down with his paws, and the latter a bull, from the custom of that beast to throw up with his horns. There is ordinarily no exchange of stocks, but when the time of delivery arrives the losing party pays the difference between the price of stocks then and at the time the contract was made. The terms are now recognized in the exchanges of the largest cities of England and America. The corresponding terms in French are *baisier* and *hausier*, or speculators on a fall and on a rise.

**BEAS, or BEYPASHA**, anciently called Hyphasis, a river of the Punjab, in western India. It rises in the Himalaya mountains, 13,200 feet above the level of the sea, and empties into the Sutlej at Endreesa. Its length is estimated at from 210 to 220 miles. In the winter it is fordable in most places, but in summer has been known to be 740 yards wide at a distance of 20 miles from its confluence with the Sutlej.

**BEASLEY, FREDERIC**, an American divine, and professor of mental philosophy in the university of Pennsylvania, born near Edenton, N. C., in 1777, died at Elizabethtown, N. J., Nov. 2, 1845. He graduated at Nassau hall in 1797, and after being for 2 years tutor in that institution, was in 1801 ordained deacon in the Episcopal church, and was successively engaged as rector in Albany, N. Y., and in Baltimore, Md. He was from 1813 to 1828, professor of mental philosophy in the university of Pennsylvania, and became favorably known by his metaphysical work in defence of the philosophy of Locke, which he published in 1822, entitled a "Search of Truth in the Science of the Human Mind." After retiring from the university he took charge of a church in Trenton,

where he wrote an answer to the doctrinal views which Dr. Channing was at that time propounding. From the year 1886 he lived in retirement at Elizabethtown, pursuing literary and theological studies. He published an "Examination of the Oxford Divinity," during the tractarian controversy, which was highly esteemed at home and abroad both for its style and erudition.

**BEATIFICATION.** The decree of beatification precedes the solemn canonizing of a saint, in the Roman Catholic church, and is pronounced by the pope and cardinals. In order that the process may be commenced, it is necessary that the candidate should have died with a general reputation for sanctity and supernatural gifts, or should have suffered martyrdom; and that the commencement of the process should be requested by some person of consideration. A very long and careful examination into the grounds for this popular reputation of sanctity, conducted in a strictly judicial manner, is entered into, which, according to the ordinary rule, cannot be completed until 50 years after the death of the individual. The points to be examined, on which the ultimate decision rests, are, whether the person practised virtue in a heroic degree, and performed miracles. It is necessary that 2 miracles be wrought, after the process has commenced, and before the beatification takes place. These ostensible miracles must be examined by men of science, and particularly, in case of miraculous cures, by the physicians of the parties. The promoter of the faith raises all possible difficulties and objections against the beatification, and is therefore usually called "the devil's advocate." By the decree of beatification it is declared that the servant of God possessed heroic virtue and miraculous gifts, that he is actually among the blessed in heaven, and entitled to special honor. The public veneration, which is allowed to be given to one who is beatified only, is restricted to certain places, communities, or persons, and also to certain specified acts of respect. The right of pronouncing the decree of beatification, formerly conceded to bishops, was reserved to the holy see, by Alexander III., A. D. 1170.

**BEATITUDE**, the Christian term corresponding to the *eudaimonia* of the Greeks, and the *summum bonum* of the Romans, meaning the highest degree of happiness of which our nature is susceptible, and applied particularly to the state of the elect in heaven. It was a favorite topic of discussion among the scholastic theologians, who divided it into subjective and objective, perfect and imperfect, and made our eternal happiness consist in the exaltation of the Deity, in singing with choirs of angels praises to the Most High. Recent theologians have generally made beatitude consist in honoring God and sharing his perfections, a sublime though indefinite conception. Though the state of beatitude be incomprehensible to us, yet the belief in it is a motive in the present life which begets

heroism in the midst of misfortune, and an adherence to virtue in the midst of evils.—The **BEATITUDES** is the name given particularly to the 8 maxims which are the exordium to Christ's sermon on the mount.

**BEATON, DAVID, or BETHUNK**, as his name is more correctly spelled, cardinal archbishop of St. Andrew's in Scotland, born in 1494, died in 1546, was descended from an illustrious Scottish family. He was first made abbot of Arbroath, then bishop of Mirepoix in France, afterward archbishop of St. Andrew's and primate of Scotland. Paul III. created him a cardinal, at the request of James V., and afterward made him papal legate in Scotland. Cardinal Beaton was highly esteemed as a statesman, by James V. of Scotland and Francis I. of France. He was most zealous and active in his efforts to resist the progress of Protestantism in Scotland, and caused George Wishart, a young preacher, belonging to a powerful Protestant family, to be burnt at the stake, on the charge of heresy and treason. After the death of James, Beaton was imprisoned for a short time by the earl of Arran, the temporary regent, but soon released. In 1544, 2 years before the execution of young Wishart, the chief of the Wishart family with some others had conspired to kill the cardinal, while travelling through Fife. On May 28, 1546, the same persons, or relatives of theirs, having the same names, "stirred up by the Lord," as Fox says, in his Martyrology, attacked the cardinal in the castle of St. Andrew's, while he was still in bed, killed him, and hung his corpse out of the window, vested in the insignia of his rank. Knox, on hearing of this "godly fact," as he terms it, led 180 men to the defence of the murderers, who were also protected by the English government to the extent of its power.

**BEATRICE, PORTINARI**, the woman whose name has been immortalized by Dante's poems. She belonged to a Florentine family, and was quite a child when Dante, then 9 years old, saw her for the first time; she had on a dark-red dress with ornaments suited to her age, and her appearance made a deep and lasting impression upon the susceptible mind of the boy. Nine years later, he met her again dressed all in white, in company with two elderly ladies; she cast a glance toward the poet, who, trembling and amazed, stood aside; she courteously bowed to him; and from that time, she became his inspiring muse. But such a lovely being could not stay long on this earth; God seemed to have created her for one of his angels and was soon to recall her to heaven. Such was the surmise of her lover, which was early realized. She was only 24 when death overtook her beautiful form in 1290; but she had left her earthly existence to assume the immortal one given to her by genius. Beatrice's soul always glides around her poet, whose pure ideal love is a perpetual worship. His poems everywhere afford evidence of the depth of this feeling; but the most striking instances are perhaps to be found in the

30th and 31st cantos of the "Purgatory." There Beatrice appears in a cloud, with a white veil and an olive crown, clad in a scarlet robe and a green mantle; she is the emblematic personification of divine wisdom.

BEATTIE, JAMES, a Scotch poet, son of a respectable farmer, born in Kincardineshire, Oct. 25, 1735, died at Aberdeen, Aug. 18, 1803. He obtained a scholarship at Aberdeen, and subsequently became assistant in the Aberdeen grammar school, and married the daughter of the head schoolmaster. After this event he began to be distinguished as a writer, and in 1771 commenced the publication of his work called the "Minstrel." This obtained for him the patronage of Lord Errol, and caused him to be appointed professor of moral philosophy and logic in Marischal college. In 1765, he published a poem, the "Judgment of Paris," which failed of any celebrity. The work which gained him the greatest fame was an "Essay on the Nature and Immutability of Truth," in opposition to sophistry and skepticism. It was designed as a reply to Hume, and was so much in demand that in 4 years 5 large editions were sold; and it was translated into several languages. It procured for its author the degree of LL. D. from the university of Oxford, and a private conference with George III., who granted him a pension of £200. He was urged by the archbishop of York and the bishop of London to take orders in the church of England, a proposal which he declined. While in London he became intimate with Dr. Johnson, Dr. Porteus, and other distinguished literary characters. In 1783, he published "Dissertations, Moral and Critical," and the "Evidences of the Christian Religion," written at the request of the bishop of London. In 1790 he published the 1st volume, and in 1793 the 2d, of his "Elements of Moral Science;" subjoined to the latter was a dissertation against the slave trade. His last publication was an account of the life, writings, and character of his eldest son, James Hay Beattie. Two paralytic strokes, which followed the loss of reason by his wife, caused his death, at the age of 68.

BEATTIE, SIR WILLIAM, M. D., born 1770, died 1843. He was physician to the fleet, in England, and also to Greenwich hospital. He was present at the battle of Trafalgar, Oct. 21, 1805, attended on Lord Nelson's last moments, and, on his return to England, published an "Authentic Narrative" of his death. In 1831, William IV. knighted him.

BEAUCAIRE, a commercial town of France, department of Gard, on the right bank of the Rhone. It is connected by a suspension bridge with Tarascon, opposite, at the head of the canal de Beaucaire; and is contiguous to the junction of railways to Avignon, Marseilles, Orléans, and Alais, by Nîmes. It has an annual fair, established in 1217, by Raymond, count of Toulouse, which was formerly the largest in Europe. Population in 1856, 12,713.

BEAUCHIEF ABBEY, a chapelry of England, county of Derby. Fitz-Ranulph, lord of Alfreton, built an abbey here in expiation of the murder of Thomas à Becket. A portion of this abbey still remains, and forms the tower of the present chapel.

BEAUCLERK, TOPHAM, one of Dr. Johnson's favorite friends, born 1739, died March 11, 1780. He was the only son of Lord Sidney Beauclerk, 8d son of the 1st duke of St. Albans, and in general appearance much resembled his great-grandfather, Charles II. He studied at Oxford, and his conversational talents so much charmed Johnson that when "The Club" was founded, in 1763, he was one of the nine members who originally formed it. When he went to Italy, in 1762, Johnson wrote to his friend Baretti, warmly commending Beauclerk to his kindness. In 1765 he accompanied Johnson on a visit to Cambridge. In 1768, when he seduced Lady Diana Spencer, wife of Viscount Bolingbroke (he married her immediately after she was divorced), Johnson would not hear him attacked. A short time before his death, Johnson said of him: "He is always ready to talk, and is never exhausted;" and when communicating his death to Boswell, he said: "His wit and his folly, his acuteness and maliciousness, his merriment and reasoning, are now over. Such another will not often be found among mankind."

BEAUFORT. I. An eastern county of North Carolina, bordering on Pamlico sound. It has a level surface, and a sandy or marshy soil. The productions in 1850 amounted to 193,542 bushels of Indian corn, 121,941 of sweet potatoes, 28,409 lbs. of butter, and large quantities of tar and turpentine. There were 26 saw and shingle mills, 47 tar and turpentine manufactories, 2 turpentine distilleries, 14 churches, and 1 newspaper office. The Pamlico river, which intersects the county, is navigable by vessels drawing 8 feet of water. Formed in 1741, and named in honor of the duke of Beaufort. Capital, Washington; pop. in 1850, 14,811, of whom 5,244 were slaves. II. A southern district of South Carolina, bordering on the Atlantic, separated from Georgia by the Savannah river, and having an area of 1,540 sq. miles. It is bounded on the N. E. by the Combahee river, and intersected by the Coosawhatchie. All of these rivers are navigable by small vessels, and the places on the Savannah are accessible by steamboats. The surface is low and level, the soil sandy and alluvial, producing cotton, rice, Indian corn, and potatoes in great abundance. In 1850 it yielded 47,280,082 lbs. of rice, 12,672 bales of cotton, 492,671 bushels of Indian corn, 485,077 of sweet potatoes, and 29,267 of oats. There were 55 churches, 1 newspaper office, and 598 pupils attending public schools. Beaufort is one of the most thickly settled districts of the state. Capital, Coosawhatchie; pop. in 1850, 88,805, of whom 82,279 were slaves.

BEAUFORT. I. A port of entry, and the capital of Carteret county, North Carolina. It

stands at the mouth of Newport river, a few miles from the sea, is accessible by steamboat from Albemarle sound, and has a commodious and well-sheltered harbor, considered the best in the state. On Bogue point, at its entrance, is Fort Macon. Beaufort contains a courthouse, a jail, 1 or 2 churches, and several seminaries. It is a place of extensive trade, chiefly in turpentine and resins. The shipping of the district, June 30, 1853, amounted to 776 tons registered, and 1,851 tons enrolled and licensed. During the preceding year, 4 schooners with a burden of 460 tons had been built here. Pop. in 1853, about 2,000. II. A town and port of entry on Port Royal river, Beaufort district, South Carolina. It is about 16 miles from the sea, and has a spacious harbor, at the mouth of which, however, is a bar which prevents the entrance of vessels drawing more than 11 feet of water. The town has little commerce, and is unhealthy in the autumn. White pop. in 1850, 879; slave pop. not given.

BEAUFORT, a large inland district of Cape Colony, South Africa, lying south of the Boesjesmans' territory, and having an area of about 20,000 sq. miles. Pop. in 1838, 5,904. Beaufort is its capital town.

BEAUFORT, FRANÇOIS DE VENDÔME, duke of, a grandson of Henry IV. of France, born in Paris, January, 1616, died June 25, 1669. He is peculiarly known by the conspicuous part he took in the civil war of the Fronde. He had served with some distinction during the 30 years' war, and meddled in the conspiracy of Cinq-Mars against Cardinal Richelieu. In consequence of this last affair, he was obliged to seek a refuge in England. On the accession of Louis XIV., the queen-regent treated him very favorably, but was soon dissatisfied with his impertinent manners. Her displeasure threw him on the side of the malcontents, and he became one of the leaders of the Frondeurs. He was extremely popular with the Parisians, on account of his descent, his familiarity with the citizens, and the pleasure he took in using their language, or even their slang. He was consequently called *le roi des halles*, and he exercised a powerful influence on the common people against Cardinal Mazarin, who was twice driven out of France. But becoming tired of civil war, he made his peace with the court; and Louis XIV. having taken into his hands the reins of government, Beaufort was appointed to the command of the navy. In 1664 and 1665 he successfully led attacks against the corsairs of Africa; in 1666 he was at the head of the fleet which was to join the Dutch to make war against England; lastly, in 1669 he went to the assistance of the Venetians, then besieged by the Turks in the island of Candia; he fought bravely and was killed in a sally.

BEAUFORT, HENRY, cardinal, and bishop of Winchester, born at the castle of Beaufort, in France, about 1370, died at Winchester, April 11, 1447. He was the 2d son to John of Gaunt, duke of Lancaster, by Catherine Swyn-

ford, and was thus the brother of Henry IV., the uncle of Henry V., and the great uncle of Henry VI., kings of England. Educated at the 2 English universities and in Germany, he was early promoted from the bishopric of Lincoln to the wealthy see of Winchester, and when after the death of Henry V. he became the powerful rival of the duke of Gloucester in the council of regency, he had 8 times borne the high office of chancellor, had assisted at the council of Constance, and had made a pilgrimage to Jerusalem. The rivalry and strifes of the duke and cardinal are the most prominent feature in the history of England for many years. In 1429 the latter was appointed by the pope captain-general of the crusade against the Hussites of Bohemia, and having raised a force for this purpose in England, he betrayed the cause of the pope by acting only against the French. This conduct, however, added to his popularity in England, but in his absence, while attending the young king Henry VI. in France, where in the church of Notre Dame, at Paris, he placed the crown upon his head, an unsuccessful attempt was made by the duke of Gloucester to deprive him of his bishopric, and to destroy his power by bringing against him a series of charges in a meeting of peers. Taking part in the affairs of France, the cardinal exerted himself in vain to reconcile the dukes of Burgundy and Bedford. Of the 2 competitors by whose struggle for the supremacy the affairs of England were vexed, Gloucester was in 1447 arrested at Bury St. Edmund's, where he soon after died suddenly and mysteriously, not without suspicion of poison, and within 6 weeks he was followed to his grave by Beaufort, who died with a lingering sickness. The drama of Shakespeare reflects the public sentiment of the time, which was unfavorable to the cardinal. The hospital of St. Cross at Winchester, which still remains, was liberally founded by the provisions of his will.

BEAUFORT, HENRI ERNEST GROUT, chevalier de, a French traveller, born Feb. 25, 1798, at Aubevoys, department of Eure, died Sept. 3, 1825. He attempted to continue the exploration so boldly commenced in Africa by Mungo Park, and prosecuted under the auspices of the African association. In 1824 he visited the Gambia, Bakel, Bondoo, and Kaarta; in 1825 he went as far as the Kasso, the cataracts of Felou and Gavina, and the Bambook, gathering important information, and drawing sagacious conclusions from facts he had observed. Unfortunately death overtook him before he had reached Timbuctoo.

BEAUFORT, MARGARET, countess of Richmond and of Derby, a patroness of learning in England, born at Bletahoe, in 1441, died in 1509. She was of royal descent, and was married to the earl of Richmond, half-brother to Henry VI., by whom at the age of 18 years she had one son, who was afterward king of England, under the title of Henry VII. After the death of the earl of Richmond, she married

successively Sir Henry Stafford, and Thomas Lord Stanley, but had issue by neither of these marriages. She was celebrated for her devotion and charity. By her bounty, 2 colleges, Christ's and St. John's, were endowed at Cambridge, and a professorship of divinity established in each. She often declared that if the princes of Christendom should undertake a new crusade against the Turks, she herself would follow the army. She was the author of the "Mirroire of Golde to the Sinfull Soul," translated from a French translation of the *Speculum Aureum Peccatorum*, and of a translation of the 4th book of the "Imitation of Christ."

BEAUGENOCY, an old town of France, department of Loire, 16 miles S. W. of Orleans, on the right bank of the Loire, pop. in 1856, 5,072. In 1152 a council was held here which divorced King Louis VII. from Eleanor of Aquitaine, who was soon to become the wife of Henry Plantagenet, then heir apparent of the crown of England. Beaugency was formerly surrounded by walls, flanked with towers and bastions, and protected by a powerful castle. Of all this little now remains.

BEAUHARNAIS, ALEXANDRE, vicomte de, a French general, born in 1760, in the island of Martinique, died June 23, 1794, on the scaffold. He was major in a regiment of infantry when he married Josephine Tascher de la Pagerie, who was to become after his death the wife of Bonaparte. He distinguished himself in the American war, under the command of Count Rochambeau. In 1789 he was elected deputy to the states-general by the nobles of Blois, and was among the first of his order who joined the *tiers-état*. He was twice president of the national assembly. He occupied the chair when the flight of Louis XVI. was made known: "Gentlemen," he said, in a dignified and quiet manner, "the king left Paris last night; let us take up the order of the day." A little later he joined, as a division-general, the army of Custine, on the Rhine. Mentz was besieged by the allies, and might have been delivered by a bold movement; but Beauharnais remained inactive for 15 days, and the city surrendered. Being arraigned before the revolutionary tribunal, he was sentenced to death and beheaded when only 34 years of age.

BEAUHARNAIS, EUGÈNE DE, duke of Leuchtenberg, viceroy of Italy, born in Paris, Sept. 3, 1781, died in Munich, Feb. 21, 1824. He was the son of Viscount Alexandre Beauharnais by Josephine Tascher de la Pagerie, afterward empress of France. When his father was executed for having failed to rescue Mentz, he was not yet 18 years old; and nevertheless went to Brittany in order to serve there under Gen. Hoche, who had been his father's friend. In 1795 he went back to Paris, and called on Gen. Bonaparte, then the commander of the metropolis, to obtain from him the return of his father's sword, which had been taken away on the disarming of the sections subsequent to

the 18th Vendémiaire. Bonaparte at once granted his request, and soon received the visit of Madame Beauharnais, who was desirous to give her thanks to the general. At this interview the lady made a deep impression upon the heart of the general, and a few months later, March 8, 1796, was married to him, on the eve of his taking his departure for Italy, where he was to assume the command of the French army. Young Eugène remained at Paris to pursue his education; but toward the end of 1797, being appointed second lieutenant, he started for Italy. On the peace of Campo Formio, he was commissioned to receive the submission of the Ionian islands. On his way back to the army he passed through Rome, and was in that city when a sedition broke out against the French, during which Gen. Duphot was killed. Eugène displayed great courage in quelling the *éméute*, and rescuing the body of the unfortunate commander. In 1798 he followed his father-in-law to Egypt, where he distinguished himself in several encounters; he was severely wounded under the walls of Acre. He returned to France with Bonaparte, was appointed to a captaincy in the consular guards, and after the battle of Marengo promoted to the rank of major. On the establishment of the empire, he became a prince and colonel-general of the chasseurs; in 1805 state arch-chancellor, grand officer of the legion of honor, and viceroy of Italy, which government he kept until 1814. After the treaty of Presburg, he married Augusta Amelia, daughter of the king of Bavaria, on which occasion Napoleon invested him with the title of prince of Venice, proclaimed him "his adopted son, and heir-apparent to the crown of Italy." On his taking the reins of government, Eugène was only 24, but showed at once great prudence and discretion, taking advice from the most experienced, and selecting the most competent for the various offices. Improvements were introduced in all branches of the administration. The Italian army was reinforced, and soon ranked among the best troops of the great empire; the fortresses and the coasts were put in a state of defence; uniform laws promulgated; facilities for public education increased; beggary suppressed by the establishment of asylums for the poor; and the cathedral of Milan completed. All this was accomplished without any addition to the taxes; never were the fiscal charges so moderate, and yet, in 1818, the public treasury had a surplus of 92,000,000 livres, Italian. Italy had enjoyed 8 years of tranquillity and prosperity under the wise administration of the viceroy, when the fourth Austrian war broke out, and Eugène with scarcely 60,000 soldiers had to oppose an army of 100,000 under Archduke John. Being constrained at first to concentrate his troops behind the Tagliamento, he was defeated in the battle of Sacile, April 16, 1809; but soon took his revenge on the banks of the Piave, where he inflicted on the Austrians a loss of 10,000 soldiers and 15 pieces of cannon.

Eugène pursued them into Carinthia, defeated them in several encounters, and joined the great French army in the plains of Austria. Then, by order of the emperor, he invaded Hungary, and gained, June 14, near Raab, a bloody victory over Archduke John, whose army was by one-third stronger than his own. Three weeks later, he took an important part in the gigantic battle of Wagram. The glory he had acquired, and the partiality of Napoleon toward him, had excited jealousy among some members of the imperial family; and intrigues produced some coldness between the adopted son and the father-in-law. It was the time, moreover, when, yielding to political motives, Napoleon began to think of divorcing Josephine. This was one of the saddest periods in the life of Eugène, who adored his mother as much as he respected Napoleon. Notwithstanding all his entreaties, the divorce took place; and to make the cup more bitter to the lips of Eugène, he was obliged, as state arch-chancellor, to announce the event to the senate. In 1812 he commanded the 4th corps of the tremendous army which invaded Russia, greatly contributed to the victory on the Beresina, by holding possession of the redoubt of Borodino, which he had stormed twice, by superhuman efforts. During the awful retreat, in which more than 200,000 French soldiers perished, no one among the generals of Napoleon displayed so much self-possession, firmness, and intrepidity as Prince Eugène; when all were despairing he maintained an invincible constancy; and what little could be preserved from the ruins of the army, was saved by his unwearied exertions. Napoleon had intrusted Murat, king of Naples, with the command of the retreating forces; but he abandoned the forlorn undertaking, and Eugène alone was bold enough to continue and bring back the miserable remnants of the grand army. The retreat he conducted from Poznan to Leipsic has been considered by competent judges as one of the most extraordinary war operations on record. When speaking of that disastrous campaign, Napoleon more than once said: "Every one of us committed faults and blunders; Eugène alone committed none." He had at last gathered the remaining forces behind the Elbe; thus giving time to Napoleon for preparing his last resources. Before leaving the army he contributed much to the victory of Lutzen. Then he repaired to Italy, where his presence was called for. In less than 8 months a new army, amounting to 50,000 soldiers, was organized; all the fortresses were prepared for defence. He took such advantageous positions in the mountains of Carinthia and Carniola, that he would have preserved Italy, if it had not been for the defection of Bavaria. The Austrians were permitted to enter by the Tyrolese passes, and Eugène had to fall back on the Adige. There he held his ground for 8 months against the Austrians; but meanwhile the king of Naples had sided with the enemies of his brother-in-law and benefactor.

In January, 1814, 30,000 Neapolitans, aided by 10,000 English and Austrians, invaded upper Italy. Eugène fell back on the Mincio, and triumphed once more over the Austrians on Feb. 8; but all his exertions were of no avail, the great empire was crumbling. When all hope was gone, Eugène at last left Italy, and retired to the court of his father-in-law. There he received, with the principality of Eichstätt, the titles of duke of Leuchtenberg and first peer of the kingdom. He thenceforth devoted himself to the task of bringing up his children, and was 9 years later suddenly carried away by an apoplectic fit. Prince Eugène left by his wife, the princess of Bavaria, 2 sons, and 4 daughters. The eldest among the latter, Josephine, is the queen of Oscar of Sweden; the next, Eugénie Hortense, married to the prince of Hohenzollern-Hechingen; and the third, Amalia Auguste, widow of Don Pedro I., is now empress-dowager of Brazil and duchess of Braganza. Of the 2 sons, the elder, Auguste Charles, the husband of queen Donna Maria, of Portugal, died March 28, 1885; and the younger, Maximilian Joseph, who had, in 1842, married the grand duchess Maria, daughter of Czar Nicholas I., died Dec. 6, 1862.

BEAUHARNAIS, FRANÇOIS, marquis de, born Aug. 12, 1756, at La Rochelle, died in 1828. He was the brother of Alexandre, and was also sent to the states-general. He was an unflinching royalist, and in 1792, he framed a plan for the flight of the royal family; but having failed in his attempt, he left France and joined the army under the prince of Condé, in which he was appointed major-general. After the 18th Brumaire, he sent to his sister-in-law, Josephine, a missive, to be delivered into the hands of Bonaparte, in which he requested him, "in the name of the only glory he had yet to gain, to restore the crown of France to the Bourbons." He was, however, recalled to France on the occasion of his daughter's marriage with M. de Lavalette, and appointed director-general of the post-office, then ambassador to Etruria and to Spain; but Napoleon being soon dissatisfied with his services in that capacity, he was recalled.

BEAUHARNAIS, HORTENSE EUGENIE, wife of Louis Bonaparte, and queen of Holland, born at Paris, April 10, 1788, died at Arenenberg, Switzerland, Oct. 8, 1887. She was the daughter of Alexandre Beauharnais and Josephine, afterward wife of Napoleon. She was to have married Desaix; but on Jan. 7, 1802, in compliance with the wish of Napoleon, she became the wife of Louis, who also gave up a former attachment for the marriage. The union was not a happy one; and Hortense returned to Paris, and lived a dissolute life there apart from her husband. Prominent among her lovers was the comte de Flahaut, for whom she composed her popular air, *Partant pour la Syrie*, as he was leaving Paris for Germany, and Admiral Veruel, a Dutch naval officer. The former is believed to have been the father of M. de Mor-

ny, universally recognized as the illegitimate half-brother of Napoleon III., whom he greatly aided in becoming emperor; and to the latter is attributed the paternity of Napoleon III. himself. It is known that Louis Bonaparte had a warm dispute with his brother, the emperor, touching this child, which he averred to be none of his, and that his unwillingness to recognize it as such was only overcome by the most decided measures on the part of Napoleon. After the separation of Napoleon and Josephine, Hortense remained on intimate terms with the former. When the Bourbons came back in 1814, she alone of all the Bonaparte family remained in Paris. After the Hundred Days, she lived in Augsburg, in Italy, and in Switzerland, devoted to her sons, and greatly beloved by the people with whom she came in contact, who found her a kind and gentle benefactress. When her sons had to flee, after participating in an unsuccessful attempt at revolution, in Italy, in 1831, she went for a time to Paris, and was kindly received by Louis Philippe. She possessed much literary, as well as social talent. Of her 4 acknowledged children, only Napoleon III. and M. de Morny now survive.

**BEAUHARNAIS, MARIE ANNE FRANÇOISE MOUCHARD**, better known as Fanny, comtesse de, a literary woman, born at Paris, in 1738, died July 2, 1813. She married, when still very young, the Count Beauharnais, uncle to Alexandre and François, but soon separated from her husband, and retired into a nunnery, whence she emerged, after the revolution, to lead a very free life at Paris, where, after the divorce of her relative, the empress Josephine, she fell into obscurity. She wrote some miscellaneous poems, a novel, and several comedies, which are now forgotten. Notwithstanding her kindness and benevolence, she was sometimes bitterly criticized; and it was to her Lebrun alluded, in his pungent epigram:

Egée, belle et poète, a deux petits travers:  
Elle fait son visage, et ne fait point ses vers.

She was, indeed, charged with signing her name to poems which were written by her lovers.

**BEAUHARNOIS**, a county in the S. W. extremity of Canada East, extending to the St. Lawrence on the N. W., and from New York state on the south. It has an area of 717 sq. miles. This surface is drained by the Chateaugay river and several minor streams, and produces oats and abundant pasturage for sheep and cows. Butter is the principal product. Pop. 40,213. The chief towns are Huntingdon and Beauharnois. The latter is a post village situated on lake St. Louis, formed by the St. Lawrence, 33 miles S. W. of Montreal; pop. in 1851, 800.

**BEAUJOLAIS**, a district of France, in the ancient province of Lyonnais, forming now the northern part of the department of Rhone, and a small part of that of Loire. It belonged for a long while to the ducal house of Bourbon, was confiscated in 1522 from the great constable of Bourbon, and united to the crown by Francis I.;

it was afterward given back, in 1560, to a nephew of the constable, and in 1628 came, by marriage, to the house of Orleans, where it remained until the revolution. Its name is preserved now by an excellent wine which is produced on its hills, *Vin de Beaujolais*.

**BEAULIEU**, or **EXE**, a parish of Hants, England, at the mouth of the river of the same name. It contains the ruins of an abbey founded by King John, and memorable for having afforded refuge to Margaret of Anjou and to Perkin Warbeck. Within the limits of the manor of Beaulieu, exemption from arrest for debt is still enjoyed.

**BEAULIEU, CAMUS DE VERNET**, a favorite of King Charles VII., of France, died in 1427. When M. de Giac, a former favorite of the king, was murdered by order of the constable, Artus of Richemont, Beaulieu was put in the place of the murdered man, appointed at once commander of the castle of Poitiers, where the king resided, first equerry and grand master of the horse, with full control over the finances. But Richemont, dissatisfied with his conduct, sent four or five soldiers, who summarily despatched him while he was enjoying a ride around the castle. Charles VII., very little moved by this not unusual accident, received another favorite from the constable.

**BEAULIEU, JEAN PIERRE**, baron, an Austrian general, born in 1725, at Namur, Belgium, died in 1819, at Lintz. He first served during the 7 years' war; being afterward promoted to the rank of major-general, he was put in command of the troops sent against the rebellious Brabantina, whom he soon conquered by his humanity no less than his courage and skilful measures. In 1792 he fought against the French troops, who had invaded Belgium, and defeated them in several encounters, especially at Arlon. In 1796 he was sent to Italy, against Bonaparte; the veteran was mercilessly routed by his young rival at Montenotte, Fombio, and Lodi; then repulsed, with the fragments of his army, over the Oglio, the Mincio, and the Adige into Tyrol, where, June 25, 1796, he resigned his command, which was given to Wurmser, and retired to private life.

**BEAUMANOIR, JEAN**, sire de, a celebrated French knight, born in Brittany, lived about the middle of the 14th century. He was the countryman and companion-at-arms of the illustrious Du Guesclin, and like his friend, distinguished himself in the civil wars of Brittany, when John, count of Montfort, supported by the English, and Charles of Blois, aided by the king of France, contended for the possession of that duchy. But he owes all his celebrity to that terrible encounter known as the *combat des trente*. He then had the command of the castle of Josselin; and being enraged at the depredations committed by Bemborough, the English commander at Ploermel, he challenged him to fight. It was, therefore, agreed that thirty knights of each party should meet, March 27, 1351, at a place between the two castles known

as Midway Oak. On the announcement of the coming battle, crowds of people flocked together from all the surrounding country. The two chiefs presented themselves at the head of their best soldiers, and the fight commenced in earnest. On the first onset the English excelled their adversaries; but Bemborough having been killed, the French renewed the struggle with redoubled courage, and finally won the victory. This was one of the most heroic exploits of the time, and gained such a popularity that, more than a hundred years later, when speaking of a hard contested battle, it was usual to say: "There was never such hard fighting since the battle of the thirty!" At the battle of Auray, in 1364, Beaumanoir was taken prisoner as well as Du Guesclin.

BEAUMANOIR, PHILIPPE DE, an eminent French jurist, born in Picardy, about the beginning of the 13th century, died in 1296. He belonged to the middle class, which was then gaining ground by its alliance with royalty, and filled some minor offices in the administration of law. In 1280 he was bailiff of Clermont, in Beauvaisis, which town was in the hands of Robert, the fifth son of Louis IX. and the head of the Bourbon family. It was according to directions from this prince that he digested and committed to writing the traditional law regulations of the country. This book, *La Coutume de Beauvoisis*, is one of the most valuable monuments of French law during the middle ages. It greatly contributed to reforming the excesses of the feudal system, and enforcing the paramount power of the monarch. It is highly esteemed, and frequently referred to by modern historians, jurists, and archæologists. It has recently been republished by order of the minister of public instruction in France.

BEAUMARCHAIS, PIERRE AUGUSTIN CARON DE, a French dramatic writer of great originality, still more remarkable for his eccentricities of life, changes of fortune, and elasticity of mind, born Jan. 24, 1732, at Paris, died May 19, 1799. He was the son of a watchmaker, and after receiving a slight education at a private school, he was brought up to the trade of his father; but, being very fond of music and social pleasure, he paid little attention to it, so that his father, a very kind-hearted man, thought it necessary to expel him from his house, though meanwhile affording him assistance secretly. They were soon reconciled, and young Caron, ambitious to make amends for his previous conduct, took to the trade with such earnestness that he made considerable progress, and even invented a valuable improvement in the making of watches. This being contested by Lepaute, then a very celebrated watchmaker, the litigation was submitted for decision to the academy of science, who rendered a verdict in favor of the young competitor, which success caused him to be appointed watchmaker to the king. In this capacity he had access to court, where he was remarked for his handsome figure and lively countenance. To these he was soon

indebted for an office in the royal household, and then for his marriage with a widow in good circumstances. His wife died, and Beaumarchais would have been reduced to poverty if it had not been for his talent as a musician. Being a skilful player on the harp and the guitar, he was asked to play before the daughters of Louis XV., and was soon admitted to their concerts and parties, the direction of which was intrusted to his care. Such favor, although bringing no pecuniary profit, excited envy, but eventually became the cause of his fortune. Through his influence with the princesses he was enabled to be of some service to the great financier, Paris Duverney, who, by way of reward, took him as his partner in some transactions, by which the young man gained large sums of money. Part of his profits were applied to buying an office in the royal hunting establishment, which he held for 22 years. But this did not interfere with his commercial or financial speculations. In 1764 we find him at Madrid trying to enter into some contracts with the Spanish government, but above all engaged in protecting his younger sister, who had been ill-treated by a Spanish gentleman named Clavijo. By his firmness, self-possession, industry, and adroit management, he fully vindicated his sister's honor, causing Clavijo to be shamefully dismissed from the office he held at the Spanish court. Some 3 years after his return to France, Beaumarchais produced a drama entitled *Eugénie*, the plot of which was founded on that adventure. It had a successful run, and was, under the title of the "School for Rakes," adapted for the stage at Drury Lane, then under the management of Garrick. In 1770 8 misfortunes befell Beaumarchais: his 2d drama, *Les deux amis*, proved a complete failure; he lost his 2d wife, who had brought him a large fortune, and was, consequently, deprived of the larger part of his income; lastly, his old friend and partner, Duverney, died. This last event gave rise to lawsuits which lasted more than 7 years, and involved in the issue not only the fortune of Beaumarchais, but his honor. The heir of the financier, the count de Lablache, impelled by hatred, declared an agreement by which Beaumarchais was the creditor of Duverney to be fraudulent, and sued him as indebted to the succession for a large balance. Beaumarchais first gained his cause; but, upon an appeal, it was adjudged against him, so that he was, by implication, pronounced a forger. At the same time, from a motive totally foreign to the trial, he was unlawfully detained in prison for more than 2 months. Any one else would have been irretrievably lost, but, with unconquerable fortitude, he reentered the lists, not only against his old opponent, the count de Lablache, but against the judge, Goezman, who, by his unfavorable report, had procured the reversal of the first judgment. This last lawsuit soon became paramount. The parliament, of which Goezman was a member, being very unpopular, Beaumarchais made use of the occasion, and so

skillfully managed his defence, that he enlisted the public in his interest. It seemed, indeed, as if he was pleading, not his own, but everybody's cause; in fact, this individual lawsuit became a struggle between the people, as represented by one of them assuming, for the first time in France, the title of citizen, and the hated parliament, or, rather, the old order of things, which was assaulted and battered down with all the weapons ingenuity, boldness, and wit could furnish. The memorials of Beaumarchais were indeed masterpieces of pungent eloquence, and, although worsted by his opponent in the point of law, he succeeded in coming off victorious in the eyes of the public. Meanwhile he had won one of his brightest triumphs as a dramatist. *Le Barbier de Séville* was performed in 1775, and the liveliness and comic power of the play were in perfect contrast with the sad dulness of his former dramas. Owing to some secret service he had done to the king, he was soon relieved from the incapacity resulting from the judgment rendered against him; his great lawsuit was submitted to a supreme court, and, on July 21, 1778, he definitively gained his cause. He was then the most popular man in France, and, at the same time, on the very best terms with the government. This he made use of to accomplish a great undertaking he had been pursuing for the 8 preceding years. As early as 1775 he had submitted to the king a memorial in which he insisted upon the necessity for the French government to come secretly to the assistance of the English colonies of America against England, giving as his deliberate opinion that they would prove unconquerable. Beaumarchais passed a part of the year 1775 in England as an agent of the French ministry; had interviews with Arthur Lee, and was in the most intimate relations of correspondence with Vergennes. His secrecy, his sagacity in interpreting a hint from a minister without forcing him to commit himself even verbally, his quickness of perception and his social attractions, made him a convenient instrument. His papers served to fix the wavering purpose of the king, and when Maurepas, the chief minister, hesitated about espousing the cause of the insurgent Americans, Beaumarchais, by letters, representations, and adroit flattery, assisted to bring him to the decision, which his own love of ease would have shunned. The French cabinet ostensibly professed to decline sending any assistance, but they consented to help Beaumarchais in his plan to furnish the colonies with arms and ammunition. For that purpose they had secretly advanced to him 1,000,000 livres, an equal sum being furnished by Spain, and delivered to him arms and ammunition from the public arsenals, on the condition that he would pay for or replace the same. Beaumarchais, under the firm of Roderique Hortalez and Co., as early as the beginning of 1777, forwarded 3 of his own ships, carrying 200 pieces of ordnance, 25,000 muskets, 200,000 lbs. of gunpowder, and other ammunition. He had also

engaged more than 50 officers, who sailed on board the *Amphitrite*, his largest ship; and among the number were LaRouerie, Pulaski, and Stenben, who so powerfully aided in the success of the American troops. This first fleet safely arrived at Portsmouth, and inspired the colonists with renewed hope. Several other ships were sent during the same year, and about the month of September Beaumarchais's disbursements amounted to more than 5,000,000 francs. Congress, being under the impression that these supplies were gratuitously furnished by the French government, under a disguised form, neglected to make remittances to Beaumarchais, who found himself in embarrassed circumstances, from which he was relieved by the French government advancing him another million of francs. The forwarding of supplies was continued, and toward the beginning of 1779, no less than 10 vessels sailed at once, but few of them reached their destination. At that time the United States were indebted to Roderique Hortalez and Co., or, rather, Beaumarchais, to the amount of more than 4,000,000 francs. Although congress did not hesitate to acknowledge its obligations toward the French firm, the settlement of so large indebtedment met with many difficulties, and it was not till 1835 that the final balance of about 800,000 francs was paid to the heirs of Beaumarchais. The transaction, far from having been profitable to the latter, as it has been frequently asserted, resulted in losses, which he was enabled to withstand through government aid and some more successful speculations of various kinds. One of the largest, which, however, ended by being disadvantageous, was the first complete edition of Voltaire's works, known as the "Kehl edition." Amid all the bustle of commercial affairs, Beaumarchais did not neglect literature, and, in 1784, he came out with the most celebrated of his plays, *Le Mariage de Figaro*. "To write this piece," a biographer says, "was certainly a difficult task; but to have it performed was a thing which would have been impossible to any one but Beaumarchais." Louis XVI. had emphatically decided that it should never be performed under his reign; and, nevertheless, the performance took place 6 months later. It was certainly one of the most striking events among the forerunners of the French revolution. The eagerness to see the play was unprecedented, and such was the anxiety to be present at the first representation that thousands of persons thronged to the entrance of the theatre from the early morning. Ladies of the highest rank passed the day and dined in the private boxes of actresses, to secure their seats, and 2 men were smothered in the rush at the opening of the doors. Words are inadequate to express the public rapture, and the piece had to be performed for 2 years in succession. The first 67 representations brought to the theatre 846,197 francs, which netted 298,755 francs clear profit, out of which Beaumarchais received 41,499. This was a trifle for a man who was engaged in

immense speculations, such as the establishment of a bank of discount, nearly on the plan of the bank of England, and the supply of water to the inhabitants of Paris, for which he was virulently abused by Mirabeau, who was then a zealous pamphleteer. In 1787 he was again entangled in a lawsuit, when he had as his opponent Bergasse, a dashing young lawyer from Lyons; but his cause was devoid of interest, and apparently not very creditable to his morality, and while he was successful before the court he lost it before the public. In 1792 his last drama, *La Mère coupable*, was performed. During the reign of terror, being anxious to give evidence of his patriotism, he bought some 60,000 muskets in Holland for the French republic, but, through some mismanagement, they were not delivered in time, and Beaumarchais was charged with the intention of selling them to the *émigrés*. He thought it prudent not to wait for a trial, and went to England, from whence he sent an apologetical memoir, entitled *Mes six époques*. He, however, returned to his native country, and was committed to prison. His life was saved by Manuel. He continued in obscurity during the directory, and died suddenly in the 68th year of his age. His complete works were published (Paris, 1809, 7 vols. 8vo) by his friend, Gudin de la Brenellerie, who left interesting MSS. upon his life. Another edition was brought out by Fevine (Paris, 1827, 6 vols. 8vo), with a biographical notice by St. Marc Girardin. A very full and able memoir of his life, by M. de Loménie, published in 1857, under the title of *Beaumarchais et son temps*, has been translated into English and reprinted in this country.

BEAUMARIS, a seaport town of North Wales, island of Anglesea, near the northern entrance of the Menai strait, a few miles from the Menai bridge. It has the ruins of a castle built by Edward I. in 1298.

BEAUMELLE, LAURENT ANGLIVIEL DE LA, a French writer, known by the unrelenting enmity of Voltaire against him, born Jan. 28, 1726, at Vallerangue, department of Gard, died at Paris, Nov. 17, 1773. While at Berlin, he was introduced to Voltaire, whose pride he deeply wounded by a remark in one of his books called *Mes pensées*. Returning to France, he was arrested at Voltaire's instigation, and confined for 6 months in the Bastille. Restored to liberty, he wrote a very witty pamphlet in answer to an attack directed against him by Voltaire during his captivity; and then devoted all his time to the composition of his *Mémoires pour servir à l'histoire de Madame de Maintenon*, which was received with marked favor; but when he was about availing himself of his success, he was arrested a second time, and confined again for more than a year in the state prison. In 1764 he married a young lady who was possessed of some property, and he had the hope of quietly living on her estate; when suddenly Voltaire's renewed hostility called him again into the literary arena. During this

new contest, La Beaumelle displayed such tact, energy, and wit, that he sometimes got the better of his powerful rival. At last, in 1770, he obtained permission to return to Paris, receiving, moreover, an appointment as assistant in the royal library, and afterward a pension. —His son, VICTOR LAURENT SUZANNE MOISE, born in France in 1772, died at Rio Janeiro in 1831, served as colonel of engineers in the army of the emperor Don Pedro, and published an interesting pamphlet on the Brazilian empire.

BEAUMETZ, BON ALBERT BRIONS DE, a member of the French constituent assembly, born Dec. 24, 1759, at Arras, died at Calcutta about 1809. He greatly contributed to reform the old laws, and insisted upon the establishment of trial by jury. He was elected president of the national assembly, May 27, 1790. On the adjournment of that body, he was appointed member of the departmental directory at Paris. In 1792, being charged with attempting to restore the monarchical government, he emigrated, wandering through Germany, England, the United States, and at last went to the East Indies, where he died. According to another report, he was permitted to return to France after the 18th Brumaire, and breathed his last a few months after arriving in his native country. He was the author of a valuable book entitled, *Code pénal des jurés de la haute cour nationale*, Paris, 1792.

BEAUMONT, a post village on the Neches river, and the capital of Jefferson co., Texas. The surrounding prairies are filled with herds of cattle and horses, the raising of which is the principal occupation of the inhabitants of Beaumont. Small vessels ply regularly between this port and Galveston.

BEAUMONT, CHRISTOPHE DE, archbishop of Paris, born July 26, 1703, in Périgord, died Dec. 12, 1781, at Paris. He is known by his severity toward the Jansenists, whom he wished to subject to the famous bull *Unigenitus*; but especially by his quarrels with the philosophers of his time. J. J. Rousseau addressed to him a letter, which is thought to be very eloquent. The archbishop was disowned by the government, and exiled, while the ministry insisted on his resignation, but he refused. His somewhat fiery zeal for religion did not exclude true kindness and charity; he not only forgave offences, but sometimes relieved his enemies from their troubles. He was held in great esteem by several sovereigns of Europe, and admired by Frederic the Great of Prussia, who offered him an asylum in his kingdom. He was buried in the church of Notre-Dame.

BEAUMONT, FÉLIX BELLATOR, comte de, a member of the imperial senate in France, born Dec. 25, 1793, at Paris. He first served in the army, was in the Russian campaign, was taken prisoner at Dresden, and liberated in 1815. He was present at the disastrous battle of Waterloo, served a few years under the Bourbons, and was discharged in 1826.

After leading, for 9 years, a private life, employed in agricultural pursuits, he was sent to the chamber of deputies, where he took his seat in the opposition; he was reelected in 1842 and 1846. He was also a member of the constituent assembly in 1848, and of the legislature in 1849. His fortune, standing, and ability, as well as his political sentiments, commended him to Napoleon III., who appointed him senator Jan. 26, 1852.

BEAUMONT, FRANCIS, born at Grace Dieu, Leicestershire, in 1585, died in March, 1616; one of the most prominent of the old English dramatists, connected for some time in literary labor with John Fletcher, so that their plays are usually published under the joint names of Beaumont and Fletcher. Of the private life of Beaumont, very little is known. He was the 8d son of Francis Beaumont, judge of the court of common pleas in the time of Queen Elizabeth, and was for a short time at Oxford, whence he went to London, and studied law at the inner temple. When he was 16, he turned Ovid's *Salmacis and Hermaphroditus* into English rhyme, and before he was 19, had become an intimate friend of Ben Jonson. His connection, a kind of dramatic partnership, with Fletcher, appears to have lasted about 12 years. It is not possible to determine with strict accuracy to how many plays he contributed, but it is supposed by the best critics that out of 53 dramas, several of which are now lost, and which were published under the joint names of Beaumont and Fletcher, only 17 really were written in part by him. Like those of other dramatists of that age, his plays contain much of value, with many passages of great force and beauty. Except by scholars, they are now rarely read or referred to. He was buried in Westminster abbey.

BEAUMONT, SIR GEORGE HOWLAND, a munificent patron of art and an amateur of considerable merit, born at his family seat in Leicestershire, England, Nov. 6, 1753, and died Feb. 7, 1827. He received his education at Eton, and subsequently devoted himself with enthusiasm to the study of painting and to the collection of works of art. His landscapes, although deficient in practical skill, are frequently well imagined, and the figures and other accessories skilfully disposed. As a friend and patron of artists, in whose society he took much delight, his claims to consideration are numerous. He was among the first to discover and encourage the genius of Wilkie, some of whose finest works were painted for him, and his gallery contained, beside many choice works of the old masters, fine specimens of the best modern English painters. He was also instrumental in establishing the British national gallery, and as an inducement to parliament to purchase the celebrated Angerstein collection for that purpose, offered to present 16 of his best pictures to the collection. The offer was accepted, and this munificent gift is now one of the most at-

tractive features of the gallery. Beaumont was also an intimate friend of Wordsworth.

BEAUMONT, J. T. G. LEPRÉVÔT DE, born in Normandy, lived during the last part of the 18th century, became known by discovering the plot called the *pacte de famine*, the object of which was a monopoly of bread during the reigns of Louis XV. and Louis XVI. A lengthened captivity was the reward of his efforts to unravel this mystery. Being made aware in 1768 of a compact by which a private company had received from the government the right of starving the country, he wrote a strong denunciation to be sent to the parliament of Rouen, which had just made complaints about monopolies; but, by some indiscretion, the document was made known to the minister of police, who had Beaumont immediately arrested and incarcerated in the Bastille, where he was kept for 11 months; then he was transferred to various prisons, his captivity lasting no less than 21 years. He was liberated Sept. 5, 1789, 2 months after the taking of the Bastille.

BEAUMONT, SIR JOHN, English poet, born in 1582, died in 1623. He was elder brother of Francis Beaumont, the dramatist, and published a small volume of poems, remarkable for its high moral tone. He also wrote a poem called "The Crown of Thorns," in 8 books, which is lost. Winstanley, in his "Honor of Parnassus," describes Sir John Beaumont as one of "the great souls of numbers."

BEAUMONT, WILLIAM, a surgeon in the U. S. army, born in 1796, and died at St. Louis, April 25, 1853. He is principally noted for his discoveries regarding the laws of digestion and for his experiments upon the body of Alexis St. Martin. In 1822 Beaumont was stationed at Michillimackinac, Michigan. On June 6, St. Martin, a young man 18 years of age, in the service of the American fur company, was accidentally shot, receiving the whole charge of a musket in his left side, from a distance of about one yard, carrying with it portions of his clothing, and fracturing two ribs, lacerating the lungs, and entering the stomach. Notwithstanding the severity of the wound, Dr. Beaumont undertook his cure, and by careful and constant treatment and attention, the following year found him enjoying good health with his former strength and spirits. In 1825 Dr. Beaumont commenced a series of experiments upon the stomach of St. Martin, showing its operations, secretions, the action of the gastric juices, &c.; these experiments he was obliged to discontinue after a few months, but renewed them at various intervals until his death; his patient during so many years presenting the remarkable spectacle of a man enjoying good health, appetite, and spirits, with an aperture opening into his stomach 2½ inches in circumference, through which the whole action of the stomach might be observed. The result of his experiments was published by Dr. Beaumont in 1833, and has been recognized throughout the medical world as a valuable addition to sci-

ence. St. Martin is still living, having visited Europe in 1857.

**BEAUMONT DE LA BONNIÈRE**, GUSTAVE AUGUSTE DE, a French advocate and writer, born Feb. 6, 1803, in the department of Sarthe. In 1831 he was commissioned, with Alexis de Toqueville, to visit the United States in order to make inquiry about the penitentiary system established here; and the result of their voyage was a report which has become a standard work on the subject, *Du système pénitentiaire aux États Unis et de son application en France*. Beside this work, while De Toqueville published his *Democratie aux États Unis*, Beaumont produced a kind of novel, *Maria, ou de l'esclavage aux États Unis*, which has been translated and reprinted in this country. In 1839, another book from his pen, *L'Irlande politique, sociale et religieuse*, commanded public attention, and was rewarded, as well as the preceding one, with the Monthyon prize of the French institute. In 1840, Beaumont was elected to the chamber of deputies, sided with those members forming the so-called dynastic opposition, and favored electoral reform in 1847. Being sent to the constituent assembly in 1848, he was a member of the committee on foreign affairs. Gen. Cavaignac appointed him ambassador to England. He was reelected to the legislative assembly, where he did not play a conspicuous part, and since the *coup d'état* of December, 1851, he has been in retirement. In 1836 he married a granddaughter of Gen. Lafayette.

**BEAUMONT DE LA BONNIÈRE**, MARC ANTOINE, comte DE, a French general, born Sept. 23, 1760, in the vicinity of Tours, died Feb. 4, 1830. He entered the service as a captain in 1784. Being a colonel in 1792, he opposed the fury of the revolutionists at Lyons, was arrested and sentenced to death; but his regiment, which had become very much attached to him, rescued him at the moment he was taken to the scaffold. He afterward served with distinction in Italy and Germany. Napoleon I. made him a senator in 1807, and a count of the empire in 1808. Still he was among the first to join the Bourbons, and was promoted to the peerage by Louis XVIII., to whom he remained faithful.

**BEAUNE**, a town of France, department of Côte d'Or, 20 miles S. S. W. of Dijon, in a fine country, at the foot of a hill which produces excellent wine; pop. in 1856, 10,458. Its most remarkable public buildings are the church of Notre Dame and the hospital founded in 1444. Its ramparts, beautifully planted, afford fine promenades. Previously to the revocation of the edict of Nantes, Beaune was among the leading manufacturing cities of eastern France; it still produces cloth, cutlery, leather, vinegar, casks, &c., but its actual importance is mostly derived from its wine trade, which is quite considerable. The vineyards by which it is surrounded yield a large quantity of wine, which is considered the best of the second growths of Burgundy. The mathematician Monge was born here.

**BEAUNOIR**, whose real name was ROBINÉAU, ALEXANDRE LOUIS BERTRAND, a French dramatist, born April 4, 1746, at Paris, died Aug. 5, 1823. He was a witty, graphic, and original writer, and produced no less than 200 plays, by which he made more than 800,000 crowns. During the revolution, Beaunoir emigrated to Belgium, then to Russia, where Paul I. intrusted him with the direction of the imperial theatre. In 1801 he returned to France.

**BEAUPRÉAU**, a town of France, department of Maine et Loire, 26 miles S. W. of Angers, on the Erve. It has manufactories of linen, woollen mills, dye works, and tanneries; but is particularly known by the bloody battle which was fought under its walls, April 2, 1793, between the Vendéans and the republicans, under Gen. Ligonier. The latter were defeated. Pop. 3,790.

**BEAUSOBRE**, ISAAC DE, a French Calvinist divine, born March 8, 1659, at Niort, died June 6, 1738, at Berlin. He received orders 2 years previous to the revocation of the edict of Nantes, and was appointed pastor at Châtillon-sur-Indre. On the closing of his church, he ran the risk of being imprisoned for holding secret religious meetings at his house, and was compelled to leave France. He took refuge at Rotterdam, and afterward went to Anhalt-Dessau, where he lived for nearly 7 years. In 1694 he returned to Berlin, and the elector Frederic William III. appointed him pastor of one of the French churches in that city. He soon after became chaplain to the queen of Prussia, and entered, in 1707, the consistory, where he held his seat for nearly 30 years. He was a scholar of uncommon attainments and a perspicuous writer.

**BEAUSOLEIL**, JEAN DU CHATELET, baron DE, a Flemish mineralogist and alchemist, born in Brabant, about 1578, died in the Bastille, in 1645. He travelled over most of the countries of Europe, seeking mines by means of the divining-rod, the great compass, the seven-angles compass, the mineral astrolabe, the metallic rake, &c. He twice visited France, and was, on a charge of sorcery, dispossessed of all his jewels and instruments, and a little later confined in the Bastille, where he died. His wife shared his labors, and probably his fate.

**BEAUTEMPS-BEAUPRÉ**, CHARLES FRANÇOIS, an eminent French hydrographer, born in 1766, near Ste. Menchould, died in 1854. His whole life was devoted to hydrographic pursuits and to the drawing of maps and charts, which are highly esteemed for their accuracy. Among his works are the *Atlas de la mer Baltique*; *Carte hydrographique générale*; *Plan de l'Escaut*; and especially the *Atlas* accompanying the account of the voyage undertaken in 1791, by D'Entrecasteaux, in search of the unfortunate La Pérouse. This last work was only published in 1808; but a copy of the manuscript maps had fallen into the hands of the English, who used them in their explorations in the Pacific. He is called the father of hydrography, and was

chief hydrographer and keeper of the rich collection of maps and charts belonging to the French navy, beside being member of the Institute and of the *Bureau des Longitudes*.

BEAUTY, the quality of objects which gives delight to the æsthetic faculty. It is found in nature, in scenery, sounds, and forms, and is produced in art, in poetry, music, painting, sculpture, and architecture. To trace its development or manifestations would be to give a history of all the arts, and we purpose here only to treat the subject abstractly. From the time of Plato, beauty, truth, and goodness have been the categories which have occupied philosophy. Truth is the ideal or absolute in the domain of intellect, goodness in that of volition or action, and after centuries of earnest speculation, beauty has at length found its place as the ideal in the domain of sensibility. As æsthetics treats of the works of art which exhibit human passion, and of the law by which we love, pity, fear, sympathize, and wonder, so beauty, which is the theme of æsthetics, is the ultimate aim of the passions and sentiments. The divine purpose revealed to the intellect is truth, revealed in human life is virtue, and revealed to the heart is beauty.—In the philosophy of Plato, which contains the oldest important extant speculations on this subject, beauty is an archetypal idea proceeding from the infinite mind and imaged in material forms. It resides primarily in God and in the human soul, is a cardinal spiritual fact, and would remain a reality though matter were annihilated. Plato, indeed, affirmed the order of the universe to be a harmonious manifestation of beauty, yet he preferred to dwell upon and praise the idea, and proposed no theory of objective beauty, of the laws by which a beautiful idea becomes a beautiful object. Though he inaugurated the 3 categorical ideas, he yet did not nicely draw the distinction between our notions of the beautiful and of the good. The enthusiastic disciple of Socrates, he made the moral element everywhere dominant in his philosophy, yet his mind was so sensitively æsthetic that he affirmed that only the spectacle of eternal beauty could give worth to this mortal life. Swayed by a twofold love, he refrained from dialectic severity. Wishing to make both beauty and goodness supreme, and unable to set either above the other, he blended them into one, and called them by a common name which embraced both the words beautiful and good.—Aristotle has treated the subject briefly and from an objective stand-point, and unlike Plato, he links beauty not with goodness but with truth. According to him, that object is beautiful which is composed with such order and proportion that we can see its parts and embrace them all together. The same view was adopted and strikingly expressed by St. Augustine in his remark, that unity is the source of beauty, that that thing is beautiful whose central principle and organic relations we can perceive. Thus, as the Platonic theory made that beautiful which satisfies the moral nature, so the

Aristotelian affirmed beauty only in that which satisfies the intellect.—The theory of Plato was cherished in the school of Alexandria, where Plotinus stated it in an admirable treatise. Material beauty, he says, is but the reflection of spiritual beauty. Mind alone is beautiful, and in loving the beautiful it loves only the shadows of itself. But the theory of Aristotle, adopted by St. Augustine, and subsequently by Boethius, was received by those of the schoolmen who speculated of beauty. The 2 greatest masters of the scholastic method were the Dominican Thomas Aquinas, and the Franciscan Dun Scotus, and while the former of these and his disciples made intellect supreme, and the latter and his disciples made will supreme, there was found no third master to assert the claims of sentiment or beauty. Thus beauty, whose alliance, in ancient philosophy, had been sought by each of the other members of the triple sisterhood, was now forsaken and an outcast.—Nor was the discussion renewed till long after the revival of letters.—In Italy, where the sternest people of antiquity has been succeeded by the most sensitive of modern nations, the modern culture of the beautiful took its rise; and its first fruits were the poems of Dante and Petrarch, and many paintings as well as poems before the end of the 15th century. The love of beauty seemed a national instinct, universal among the populace, patronized by the wealth of princes, encouraged by the learning of academies. Yet the criticism and speculation upon the subject went far behind the improvement in taste and the delight in art. Reflection among the Italians has never been able to rival the activity and power of their imagination, and though their country is the nursery of all that is best in painting, sculpture, and music, they have contributed little that is important to the philosophy of the beautiful.—In France the questions which occupied Cartesianism were foreign to æsthetics, and only minds of a second order in that great school gratified themselves with reproducing the traditions of antiquity, and feebly restating the theory of Aristotle and St. Augustine. Thus Crousaz made the beautiful to consist in 5 elements, order, regularity, proportion, unity, and variety, and André distinguished it into various degrees and sorts from the various combinations of these sources. The Père Buffier advanced the curious theory, which was afterward adopted by Sir Joshua Reynolds, that beauty consists in mediocrity, and that things are beautiful just in proportion as they are ordinary and usual. Diderot, without the Platonic faith in the idea of beauty, and unable to discover a common quality in all beautiful objects, could affirm the existence of beauty neither in the mind of man nor in the material universe. With a mind of singular acuteness, which delighted in the discovery of relations, he strangely imagined this delight to be one of the pleasures of taste, and boldly proposed the theory that beauty consists in the idea of relation—that objects are beautiful in proportion as

we can perceive their relations to many other objects. Marmontel advanced the opinion that an object is beautiful which makes us experience pleasure as we discover in it the power of its author, the abundance of resources which he had at command, and the intelligence which has presided over its formation. He thus confounded beauty with sublimity. Recent French philosophy, in its struggle against the materialism of the last century, has attended principally to questions of method and psychology, to logic, ethics, and theodicy, and has neglected or made only the most general observations upon the science of the beautiful. Jouffroy and Cousin have, however, introduced some of the results of foreign speculation.—In England, the earl of Shaftesbury, an accomplished admirer of Plato, was the first to recall philosophy to the subject of beauty, and moralized elegantly and rapturously over the supreme good and the supreme beauty which he regarded as the same. In his ethical views he considered man endowed with a distinct moral sense for discriminating between virtue and vice, and a little later Hutcheson transferred this sense from the department of ethics to that of æsthetics, and suggested a peculiar inward faculty for the perception of beauty. In reference to objective beauty, Hutcheson repeated the theory of unity and variety. The waving line by which Hogarth sought to account for beauty, especially for female beauty, may be taken as an illustration of this view. The most arbitrary and unfortunate of all the English theories on the subject is that of Burke, who, having adopted a materialistic philosophy unnatural to his genius, sought the laws of beauty in the laws of organism and of the nervous system. Every thing which produces an extraordinary tension of the nerves causes a passion analogous to terror, and is consequently a source of the sublime; every thing, on the contrary, which produces a relaxation in the fibres is a beautiful object. Other philosophers have variously sought beauty in some quality of external things or in some faculty of the soul, but Burke seeks it in the state of the body, making it a matter of the optic and auditory nerves and of animal fibre. The Scotch metaphysician, Reid, advanced what may be termed the symbolical theory of objective beauty. Starting with the Platonic view that objects are beautiful only because they express spiritual ideas, he maintained that moral beauty has certain material symbols. Thus a serpentine line is beautiful, not from any quality that it has in itself, but because it has relation to certain moral qualities, as, for instance, suppleness and gentleness. Alison accords with this view in denying any inherent beauty in objects, which, he affirms, become beautiful only as they become a source of pleasant emotions to us by association with our feelings. Thus beauty would depend upon the accident of what may be interesting to each one, and be as various and shifting as individual experience. Diderot made it intellectual, a matter of the relations it suggests;

Alison makes it passionate, a matter of the emotions it awakens; both make it objectively unreal, and subjectively indeterminate. The theory of Alison has been, with unimportant modifications, adopted and illustrated by Dugald Stewart and Francis Jeffrey. The latest English æsthetic writer is Ruskin, who raises beauty out of the sphere of accident, and like Plato affirms it to be a manifestation of the thought of Deity. It marks the material universe which is a semblance of the divine attributes, and it marks human actions which are vital with the presence of God, being the felicitous performance of his will. Every beautiful object reveals the infinite, and has a unity within itself; it is in repose, but at the same time suggests a magnificent energy; it has about it the dignity of justice and purity, and the moral judgment enters largely into the perception of its beauty. Not finding beauty and goodness separated in objects, Ruskin is unwilling to distinguish them as ideas, denies the possibility of great success in art to wicked men, and makes ideal beauty equally the aim of the religionist, the moralist, and the artist.—The first of the German thinkers upon the beautiful, and the most important writer on the subject since Plato, was Baumgarten, a disciple of Leibnitz and Wolf. While for 10 centuries beauty had been tossed to and fro from matter to spirit, and had been variously assigned to almost every quality in objects, and almost every habit of the soul, Baumgarten first fixed it firmly as that which appeals to human sensibility. The intellectual and the moral natures have their respective ideals, but the whole current of the sentiments and passions sets toward beauty. The intellect perceives with logical clearness, but there is another kind of perception, a *cognitio sensitiva*, which grasps beauty not at all by the understanding, not merely by the sense, but by the whole human sensibility. The philosopher of *Ægina*, who, according to his own expression, heard the harmony of the celestial bodies, though only the sense of sight was addressed, is an illustration of the Baumgartenian perception of beauty. It is the unity, the combined result, of the variety furnished by the senses. The theory of Baumgarten became the foundation of the science of æsthetics, and was more fully developed by subsequent philosophers. Kant accurately defined the beautiful as that which is an object of pure disinterested satisfaction; he thus distinguished it from the agreeable and the good, in both of which we are interested, since we desire to possess the former and to realize the latter. He did not in his speculations on this subject pass the chasm which separates the subjective from the objective side of his philosophy, and did not enter on the question of objective beauty. This task was left for the philosophical genius of his enthusiastic disciple, the poet Schiller, who found beauty in naturalness and simplicity, that is, in the easy and harmonious blending of idea and form. The philosophy of Fichte, which was a concentration of the universe in the Ego, and almost a moral

fanaticism, was unfavorable to speculation on this subject; since where morality monopolized all the passions, and life was but a struggle of the free power of the Ego against the resistance of nature, the sphere of art was contracted, and beauty could be at most but a spectacle of Fichtean virtue. The theory of the beautiful approached to completeness in the philosophy of Schelling. The principle of this philosophy is the higher unity or identity of the two points of view which Kant had separated, namely, subject and object—of nature which is visible mind, and of mind which is invisible nature. This unity pervades the physical universe, but is especially manifest to us in the realm of art. Beauty is the fusion of the infinite with the finite, of free spirit with fated matter, of life with nature, of idea with form. Thus art, which reveals beauty, combines the two terms of existence, whose union constitutes not only the beautiful, but also the true, the absolute, the divine. Art is therefore the highest manifestation of spirit, and is essentially religious. Schelling doubtless passed the goal in this apotheosis of art. The artistic form being the most perfect expression of truth, philosophical truth should reassume this form and return to ancient poesy and myth. He confounded truth, beauty, and goodness, philosophy, art, and religion, and the forms that were proper to each; religion became a kind of poetry, and sentimentalism, mysticism, and symbolism everywhere made an irruption into science and history. Schelling was influential in quickening the study of the monuments of art, and in reviving Christian art, and among his most enthusiastic disciples were the writers of the romantic school, Tieck, the Schlegels, and Solger. The last of these accounted for beauty on the principle of irony, and made it the end of art to reveal to the human consciousness the nothingness of finite things and of the events of the real world. The perception of beauty consists in assuming the stand-point of divine irony, playing with created things, laughing at the interests, passions, struggles, and collisions of men, at their sufferings as well as their joys, and in discerning above this tragic comedy of human life the immutable power of the absolute. To rectify and develop the conception of Schelling was the task of Hegel. To Hegel beauty is the idea in the form of its finite manifestation. It first appears in nature and in history, but is there defective because unconscious. It exists consciously in human thought, but being there only subjective seeks to realize itself outwardly. This realization of thought is beauty, whose realm is art. Works of art are the objective forms of the ideal, like the works of nature, but without the defect of nature. In the ancient symbolic form of art matter preponderated, the ideal shining through but imperfectly; in the classic form of art the ideal was in harmony with, and adequately expressed by the form; and in romantic or Christian art mind preponderates, and breaks through matter

at every point. With Hegel the history of the philosophy of the beautiful terminates, his successors having made but inconsiderable modifications of his views. The result of the brilliant series of speculations on the subject in Germany has been to establish philosophically art as the province of beauty, and sentiment as the faculty which perceives it. Schelling and Hegel, however, almost borrow the words of Plato in affirming that matter is beautiful only as it is inspired with an idea and made to express the things of the spiritual world. Among the most valuable treatises upon beauty are the "Greater Hippias," "Phædrus," "Banquet," and "Republic" of Plato; Plotinus, in the 6th book of his first Ennead; Spalotti, *Saggio sopra la bellezza*, Rome, 1765; Baumgarten, *Æsthetica*, Frankfurt, 1750; and the more recent æsthetical works of Jean Paul Richter, Bouterweck, Hegel, Vogel, and Jouffroy. (See *ÆSTHETICS*.)

BEAUVAIS, an ancient city of France, capital of the department of Oise, on the Thérain, 42 miles N. by W. of Paris; pop. in 1856 14,086. When the Romans invaded Gaul, it was the chief town of the Bellovaci; it became early the seat of a bishopric, the holder of which was, under the Capetian kings, one of the 12 peers of France. During the 14th and the beginning of the 15th century, it was held by the English; and it was Pierre Cauchon, bishop of Beauvais, who presided over the court by which Jeanne d'Arc was sentenced to be burnt. In 1472 the city, being besieged by Charles the Bold, duke of Burgundy, was courageously defended by its inhabitants, among whom a woman, Jeanne Lainé, celebrated under the name of Jeanne la Hachette, distinguished herself by her intrepidity. Beauvais is also the birthplace of Villiers de l'Île-Adam, grand master of the Hospitallers, who in vain defended the island of Rhodes against Soliman. The city was once surrounded by ramparts, which have been partly levelled and converted into promenades; it contained also a great number of convents and churches, only 2 of the latter now extant; the cathedral, one of the largest in France, the choir of which is a masterpiece of Gothic architecture; the church of St. Stephen, much older, in which the mingling of the ogive and the semi-circular arch may be perceived. The *hôtel de la préfecture* is also a curious monument of Gothic style. The imperial manufactory of tapestry, founded here in 1664 by Colbert, is next in excellence to that of Gobelins.

BEAUVAIS. I. CAMILLE, silk manufacturer of Lyons, born in 1781, died in 1852. At the age of 18 he was already at the head of a large establishment, and at 20 employed 2,000 men. He was presented to the empress Josephine by Napoleon as an instance of youthful abilities. He was the first to introduce home-manufactured China crape into the French market, his first experiments for which were made after the pattern of a small piece cut by stealth from the empress's dress. In the latter years of his

life the breeding of silk worms occupied his attention. II. CHARLES THEODORE, a French general, born Nov. 8, 1772, at Orleans, died at Paris, in the beginning of 1830. He first served as a private, but rose rapidly to the rank of adjutant-general. He went to Egypt with Bonaparte, but resigned on account of some disagreement with his chief. While returning to France, he was taken prisoner by a corsair and brought to Constantinople, where he was detained for 18 months. The first consul did not permit him to reënter the army until 1809, when he served in Spain and was afterward sent to the Rhine. In 1815 he commanded at Bayonne, and was dismissed on the return of the Bourbons. Then he returned to literary pursuits, and was the compiler of the very popular publication, *Victoires et conquêtes des Français*, the 28 vols. of which appeared in 1817 and the following years. He was also the editor of the *Correspondance officielle et confidentielle de Napoléon Bonaparte avec les cours étrangères* (Paris, 1819, 1820, 7 vols. 8vo). III. JEAN BAPTISTE CHARLES MARIE, an eloquent French preacher, born at Orlébourg in 1731, died April 4, 1790, at Paris. He entered sacred orders, with the intention of attending especially to preaching, and soon became a favorite among those who could appreciate his elegance of style and attractive delivery. The characteristics of his eloquence were suavity and tenderness, but he sometimes showed freedom, and even boldness of speech in his sermons at court. In person and talent he bore some likeness to Fénelon. He had been promoted to the bishopric of Senes, which he resigned in 1738. Six years later he was one of the deputies of Paris to the states-general.

BEAUVAU, the name of a princely French family, several members of which deserve to be noticed.—RENÉ, one of the most valiant knights of the 18th century, accompanied Charles, duke of Anjou, in his conquest of Naples, contributed to the victory of Benevento, was appointed constable of the new kingdom, and died from his wounds in 1266.—LOUIS, lord high seneschal of Provence, chamberlain to René d'Anjou, king of Sicily, with whom he lived in great familiarity, served in various war expeditions; and being sent by René as his ambassador to Pius II., died at Rome in 1462.—BERTRAND, died in 1474, was employed as a diplomatist by Charles VII. of France; he negotiated truces with England, and a little later took an active part in the conquest of Normandy. He was also in great credit with Louis XI.—HENRI, general and diplomatist, lived in the latter part of the 16th century and during the first of the 17th. He served in Hungary under Emperor Rudolph II., and distinguished himself against the Turks.—MARCO, prince of Craon, died in 1754, was governor of the young Duke Francis of Lorraine, who afterward married Maria Theresa and became emperor of Germany. Marco, rewarded with the viceroyalty of Tuscany, lived in Florence surrounded

by all the eminent literary characters of Italy, and acquired the renown of being not only one of the most learned, but perhaps the most amiable man of his time.—RENÉ FRANÇOIS, an illustrious prelate, the worthy colleague of Fléchier and Fénelon, born in 1664, died in 1739. Being bishop of Tournay when the town was besieged by Prince Eugene, he showed the utmost generosity and devotion to his flock, converting his episcopal palace into a hospital, selling all his valuables and borrowing over a million of francs to relieve the needs and sufferings of both the soldiers and the inhabitants. On the taking of the town, he was ordered to perform a Te Deum in honor of the conquerors, but courageously refused to obey the summons.—CHARLES JUSTE, marshal of France, born at Luneville, in 1730, died in 1793, distinguished himself during the siege of Prague and the glorious retreat which followed, 1742. He fought bravely at the storming of Mahon, 1756, where he commanded the principal attack, and contributed in 1760 to the victory won at Corbach by Marshal Broglie. On Aug. 4, 1789, when the revolution had already commenced, he became a member of the cabinet of Louis XVI., but his advice was of little avail, and he was dismissed at the end of 5 months. He lived long enough to see the king die on the scaffold.—CHARLES JUSTE FRANÇOIS VICTURNIEN, born March 29, 1793, served during the Russian war under Napoleon I., and was appointed senator in 1852, by Napoleon III.

BEAUVOIR-SUR-MER, a town of France, department of Vendée, opposite the island of Noir Moutier, about 3 miles from the sea, with which it is united by the Cahouette canal. It was formerly fortified. In 1588, Henry of Navarre, who was soon to become Henry IV., came near losing his life in an ambuscade, while besieging its castle. It is now a small trading port, dealing in corn and salt, produced in the neighboring salt marshes. Pop. in 1856, 2,746.

BEAUVOIS, AMBROISE MARIE FRANÇOIS JOSEPH PALISOT DE, a celebrated French naturalist and traveller, born July 27, 1752, at Arras, died in Paris, Jan. 21, 1820. He studied law, and became receiver of the crown rents. This office being suppressed in 1777, Beauvois resolved to devote himself to science, and became in 1781 a corresponding member of the academy of sciences. In 1786 he joined an expedition sent by the French government to the western coast of Africa, and explored Owara and Benin. Within a period of 18 months he gathered a considerable number of plants and insects, which he forwarded to France. He next repaired to St. Domingo, where he was admitted to the high council of the island. The colony was then in a very precarious situation, and it became from day to day more difficult to keep the blacks in subjection. A pro-slavery man and an opponent of the abolition of the slave-trade, which, according to his opinion, would have inflicted a deadly blow on the colonies,

Beauvois went to solicit assistance from the United States; but his efforts were of no avail. Upon his return in 1798, he found the island in an awful state of confusion; he lost his collections in the conflagration of Cape François, and was himself put in prison by the negroes, who naturally looked on him as an enemy. A mulatto woman to whom he had previously granted her freedom, effected his liberation and furnished him with the means of reaching the United States. On his arrival at Philadelphia, he heard that he had been proscribed in his own country; and being penniless and friendless, he undertook to teach music and the languages to support himself. He gained the acquaintance of several persons of distinction. His proscription having been annulled, he returned to France and busied himself in putting his collections in order. In 1806 he was called to the institute as the successor of Adanson. During the Hundred Days, he was appointed councillor of the university of France.

BEAUZÉE, NICOLAS, a French grammarian, born at Verdun, May 9, 1717, died in Paris, Jan. 23, 1789. Most of the grammatical notices in the great *Encyclopédie du 18e siècle* are from his pen, and have been published in a separate form, under the title of *Dictionnaire de grammaire et de littérature*, in connection with Marmontel's literary notices (Liège, 1789, 8 vols., 4to). His *Grammaire générale, ou exposition raisonnée des éléments nécessaires pour servir à l'étude de toutes les langues* (Paris, 1767), was highly praised by the learned Barthélemy, and rewarded by a gold medal from the empress Maria Theresa of Austria. This work was reprinted in 1819, and is frequently referred to.

BEAVER (*castor*, Cuv.), a fur-bearing amphibious animal, of the order *rodentia*, or gnawers. They are common to the northern and north temperate latitudes both of Europe and America; but are very rare in the middle latitudes, and are unknown in the south, even of Europe. They formerly abounded in England, so far south as Berkshire, and some persons suppose that oral tradition still survives relating to their existence in that island. Whether this be the case or not, which is open to doubt, it is certain that their bones are found in great numbers, in some districts, in the accumulations of peat in the fens, and on marshy river borders. Within a very recent period, beavers were abundant in all that country which constitutes the northern, middle, and western states of the United States; as the large number of their dams, and of the beautiful level beaver meadows, caused by the accumulation of soil and filling up of their ponds by alluvial matter, sufficiently indicates. In New York, especially in the western portion of the state, these relics of the industrious and intelligent *rodentia* are particularly numerous; and in the map of that region in Pinkerton's Atlas, published in 1815, the country between Lake Oswegatchie and Lake Oneida is laid down as "a marshy tract full of beavers and otters;" nor

is it, indeed, very certain, that some few scattered families of these interesting *amphibia* may not be yet found in that singular region, which is still almost as wild as the northern shores of Lake Superior, among the Adirondac mountains, and the sources of the Hudson river. Recent scientific observers have also seen what they believed to be fresh beaver signs on the Mushannon, in Centre county, Pa., and assert the present existence of the animal in Tennessee and Georgia. The gradual clearing up and cultivation of the country has, however, banished them, mile after mile, and day after day, from the haunts of intrusive and encroaching man, until they are now scarcely to be found, at all, on this side of the streams which have their springs among the roots of the Rocky mountains. Even there, also, such unwearied war do the wild trappers of the various fur companies wage against them, and so largely tempting to white cupidity have been the sums paid for their spoils, that they are rapidly decreasing, and will, it is probable, ere long become extinct. It has been said, however, that the application of silk to the manufacture of hats, and the large use which has been made in late years of plain felt, of different qualities, by causing a very material fall in the price of beaver, has procured them such a respite—the trappers no longer caring to labor so assiduously for the decreasing compensation—that they are again becoming numerous in places where they were a few years since almost extinct. "The beaver is low and squat in its body, about 2 feet in length. Its body is thick and heavy. The head is compressed; the line of its profile from the occiput to the muzzle is unbroken. The muzzle is oblique and blunt, and the upper lip cleft as in the hare. The eyes are small, oblique, and wide apart from each other. The ears are also small. The fur is remarkably close and soft, but interspersed with longer bristly hair, which gets more abundant as the animal grows older. Both the hind and fore feet seem short in proportion to the size of the animal, when it walks upon the ground; but, as is the case with all animals of this order, the habit of which is generally to leap, to stand up, or to support themselves on their hind legs, these are much longer than the fore ones. In the use of its feet in walking, it combines 2 distinct habits. On the fore feet it is *digitigrada*, or walks on the toes only, and on the hind feet it is *plantigrada*, or walks on the entire length of the sole. This again gives the fore feet more apparent stability than the hind ones, in walking; but it gives the whole animal a wriggling gait, and the beaver is, in consequence, rather a slow animal upon land. The tail is the most peculiar part of the structure. It is very large, nearly half as long as the body, measuring from 10½ to 11½ inches, oval in shape, and flattened on the upper and under sides. It is, also, with the exception of a small portion at the base, not covered with fur, like

the rest of the animal, but with a sort of horny scales, which are produced by a thick dusky skin. The tail is not, however, used as a trowel, spade, hammer, or any other tool, as is stated in the books; but it sometimes answers as a prop, when the animal stands erect and uses its fore paws in working. As is usually the case when animal instincts are to be lauded, the intelligence of the beaver has been absurdly exaggerated by fanciful writers, composing in their studies; as when they describe some of the beavers as lying on their backs, and receiving loads of wood and clay on their supine bellies, and then suffering themselves to be dragged along the ground by their companions, thus discharging the functions of carts, or sledges. The works of nature are sufficiently wonderful and grand without that man, in attempting ignorantly to magnify them, should render them ridiculous by his conceits." So, in like manner, all the grand works of the beaver being carried on by night, little is actually known of their manner of working, except from the examination of what they effect. All that they do in general concert is to build dams, when they have chosen the site of their settlements on running streams, which do not afford a sufficient depth of water to be secure against freezing in winter; and this they do by cutting down trees, invariably up stream of the place selected for their wear, so that the current may bear them down toward the site. The trees which they thus cut down with their keen fore-teeth, are often 5 or 6 inches in diameter. Where the current is gentle, the dam is carried horizontally across, but where the water runs swiftly, it is built with an angle or convex curve up stream. These materials rest on the bottom, where they are mixed with mud and stones by the beavers, and still more solidly secured by the deposit of soil carried down by the stream, and by the occasional rooting of the small willow, birch, and poplar trees, which they prefer for their work, in the soil at the bottom. Their houses or lodges, seldom made to contain more than 4 old and 6 or 8 young beavers, are very rudely built, sticks, stones, mud, and all the materials used in constructing the dam, being piled horizontally, with no method beyond that of leaving a cavity in the centre. There is no driving in of piles, wattling of fences, and mud plastering, as described; and when leaves or grass are interwoven, it is done casually, not to bind the mortar, as men apply hair for that purpose. The beaver conveys the materials between his fore paws and chin, arranges them with his fore feet, and when a portion is placed as he wishes it, he turns about and fetches it a slap with his tail, similar to that which he gives on the surface of the water preparatory to diving. In the breeding season, and in early summer, the beavers do not live in their houses, nor in communities, but only become gregarious in the winter, and when preparing for it. They begin to build, ordinarily, in the latter

part of August, although they sometimes fell their timber earlier in the summer; but their houses are not finished and plastered, whether owing to accident or design, until late in the season; when the mud and water freezing, as the material is laid on, add much to the security of the beavers against the wolverine, or glutton, who, with the exception of man, is their worst enemy. The food of the beaver consists of the bark of the aspen, willow, birch, poplar, and alder, of which it lays up a stock for the winter, during the summer time, on the bank opposite to its lodges; but unless compelled by necessity, it avoids the resinous evergreens, such as the pine and hemlocks. As it always performs its evacuations in the water, it is naturally, not instinctively, or by reason, a cleanly animal; and hence no filth is ever accumulated about its dwellings. The beaver produces from 2 to 5 young at a litter, and owing to its breeding away from its villages, in dispersed and solitary places, as well as to the fact that its fur is valueless at the breeding season, its extinction has been delayed longer than could be hoped. The beaver is easily domesticated, and becomes very tame. When in confinement, so soon as the building season arrives, the constructive instinct seizes him; just as the ardor for nidification and migration seizes uncoupled and caged birds, showing that nature, not reason, is at work, and that now, as of old, "the ostrich," and not the ostrich only, but all flesh, fish, and fowl in its kind, "knoweth its time."

BEAVER, a piece of armor; the lower part of the front piece in the complete helmet of the knight of the middle ages, which, with the *avantaille*, completed the vizor. When the latter was raised and the beaver lowered, the whole face was uncovered; *vice versa*, it was completely guarded. The *avantaille* covered the face from the brows downward to the nose, the beaver from the chin upward till it met the *avantaille*. Either could be opened independently of the other. When it was desirable to obtain a freer circulation of air, or to eat or drink, while preserving the incognito, the beaver was lowered; as Sir Walter Scott accurately describes, when Ivanhoe, in his romance of that name, after overthrowing Sir Brian de Bois Guilbert in the tournament, calls for a bowl of wine and quaffs it to the confusion of all foreign tyrants. When a knight, on the contrary, wished to reveal himself, he raised his *avantaille*, and so disclosed his features.

BEAVER, a county of Pennsylvania, bordering on the Ohio and intersected by Beaver river and by the Ohio and Pennsylvania railroad. It is well watered, and the soil near the streams is remarkably fertile. The surface is undulating, and in some places covered with extensive forests. Bituminous coal and limestone are abundant. In 1850 this county yielded 17,915 tons of hay, 498,773 lbs. of butter, 244,112 bushels of wheat, 226,253 of Indian corn, 329,481 of oats, beside considerable

quantities of wool, pork, &c. It contained, at the same date, 25 flour and grist mills, 18 saw mills, 3 paper mills, 5 woollen factories, 4 manufactories of agricultural implements, 5 breweries, 18 tanneries, 4 iron foundries, and several other mills and factories of various articles. Area, 650 sq. m.; pop. 26,689. Capital, Beaver.

BEAVER, PHILIP, an English navigator, born Feb. 28, 1760, died April 5, 1818. When 17 years of age, he entered the royal navy, in which he served during the war of the American revolution. After the peace, finding himself out of employment, and impatient of repose, he conceived various projects, and settled at last upon founding a colony in Africa, the object of which should be not commerce, but to cultivate the land by free labor, to civilize the negroes, and to introduce among them the European religion, arts, and manners. He had read in a French author a description of the isle of Boulama, in the archipelago of Bisagos, on the western coast of Africa, and he judged this island the most suitable place for the execution of his scheme. He communicated with numerous persons, particularly with naval officers, and found a general sympathy for his project; an act of association was therefore formed, the subscribers met, and a plan was submitted to the minister Pitt, who gave to it his approbation. On the 13th of April, 1792, 3 ships, bearing 275 white colonists under the guidance of Beaver, set sail from the Isle of Wight. The expedition proved, however, a failure. Within 4 months more than a third of the colonists had died by fever upon the African coast, and more than half the survivors hastened to abandon the project and return to their country. Those who remained, and escaped the fever, suffered incessant embarrassments and discouragements. Beaver himself, several times prostrated by the scourge which threatened to annihilate his colony, still maintained his courage, struggled hopefully, though with failing strength, against all depressing influences, and had no thought either of giving up the enterprise, or leaving the fatal island. He hoped for new supplies of men and money from England, trusted to the energy of his character to achieve the prosperity of his colony, and the elevation of the African race. He planted numerous fruit trees and vegetables, some of which were flourishing; and numerous constructions necessary to the safety and well-being of the colonists were nearly completed. Not content with regulating and watching over every thing, he himself gave the example in all kinds of labor, and selected for his own hands whatever was most difficult and painful. As he saw the spirits of the colonists still continue to droop, he called them together, pointed out to them the difficulties over which they had triumphed, and strove to revive their courage by portraying the hopes which they could reasonably cherish for the future. Yet his efforts were in vain, and he saw that he must renounce his enterprise. He embarked,

Nov. 29, 1798, with his surviving companions, from the isle of Boulama, and arriving at Sierra Leone, was attacked anew by the fever and detained 2 months. When he again embarked for England, he had with him but one of all the colonists who had sailed for Africa under his direction. He arrived at Plymouth in May, 1794; and in June, a meeting of the shareholders of the association was held in London, and in spite of the losses which resulted from the ill success of the expedition, such was the admiration which the disinterested, resolute, and noble conduct of Beaver had inspired, that the assembly unanimously voted him a gold medal in testimony of their gratitude. The events of this expedition were described by Beaver in a publication entitled "African Memoranda," a work containing much curious and original information. He subsequently went again into the service, distinguished himself in the descent of Gen. Abercrombie upon Egypt in 1801, and in the capture of the Isle of France in 1810. In 1818 he cruised in the Indian ocean, in command of the frigate *Nisus*, and died at the Cape of Good Hope from too severe exposure and labor in exploring the coast of Quiloa. Beaver was not only most efficient in action, but was also a man of taste, and possessed a large fund of knowledge. It was said that he read through the entire "Encyclopædia Britannica" during one of his long cruises.

BEAVER ISLANDS, a group in Lake Michigan, near its northern extremity, and having one island of considerable extent (40 sq. m.), called Big Beaver. After their expulsion from Nauvoo, a dissenting branch of the Mormons established themselves there under Joseph Strang.

BEAVER LAKE, the largest lake in Indiana. It has an area of 26 square miles, and is situated in Jasper county, south of the Kankakee river.

BEAVER MEADOW, a village in Carbon county, Pennsylvania, and about 100 miles north-west of Philadelphia. It is connected with the Lehigh river by a railroad, over which much coal is sent from Beaver Meadow.

BEAZLEY, SAMUEL, English architect and author, born in Westminster, in 1786, died at Tunbridge castle, Kent, Oct. 12, 1851. He erected a great many theatres in England, viz.: 8 in London, 2 in Dublin, and 8 in the provinces, beside remodelling several, adding the colonnade to Drury Lane, and the Strand façade to the Adelphi, and supplying drawings for 2 in India, 3 in Belgium, and 1 in Brazil. The merit of all his theatrical constructions is that people can see and hear in them. Mr. Beazley also erected many railway stations, including the handsome terminus of the south-eastern railway over London bridge. He wrote over a hundred dramas, many of them successful in their day. The English libretto of the "Sonnambula" and of some of the other operas were from his pen. He also wrote two novels, "The Roué" and "The Oxonians;" the first of these has been erroneously attributed to Bulwer.

**BEBAZH-EL-HAGAR**, or **BESEK-EL-HADJAR**, a ruined town of Egypt, in the delta of the Nile. It embraces more extensive remains of antiquity than any other town in that part of Egypt.

**BEBIAN**, **AUGUSTE**, an instructor of the deaf and dumb, born at Guadeloupe, W. I., about 1782, died about 1828. His father was an eminent French merchant residing on that island. At the age of 14 or 15, he was sent to Paris for his education, and placed under the abbé Sicard. He was sent first to a private boarding school, and afterward to the imperial lyceum, where he graduated. Boarding in the family of the abbé Sicard, he became interested in the education of the deaf and dumb, and after a time determined to devote himself to their instruction. He accordingly prepared himself for the work by taking lessons of the abbé and of M. Laurent Clerc, and when M. Clerc came to this country with Dr. Gallaudet, Bebian succeeded him as teacher. Subsequently, he was appointed censor of studies. This office he filled with great ability from 1817 to 1825, when he resigned it and devoted himself to literature. In 1819 he had received the prize offered by the royal academy of sciences for the best eulogy on the abbé de l'Épée. Subsequently he wrote several other biographies, among the rest one of the abbé Sicard. In 1827 he published a "Manual for the Practical Instruction of Deaf Mutes." After his resignation, he visited the institutions for deaf mutes in other countries.

**BEBUTOFF**, **WASSILJI OSSIPOWITCH**, prince, a Russian general, born in 1792, the eldest of 4 brothers, who have been more or less connected with the Caucasian war. Their father held the office of treasurer under the administration of Prince Julon, in Georgia; the grandfather was governor of Tiflis, and accompanied Nadir Shah in his expedition to India. For some centuries past we find the family, which originally came from Armenia, occupying a high position among the princely houses of Georgia. Wassilji, after having completed his education at the military academy of St. Petersburg, joined in 1809 the army in the Caucasus, and in 1812 accompanied the Caucasian governor-general, Paulucci, to Livonia, where he took a part in the operations against the French. In 1817 he acted as adjutant of the Russian plenipotentiary, Gen. Jermoloff, on his mission to Persia, on which occasion his familiarity with the Persian language and customs proved invaluable. The subjugation of the territory Akkoosha, in the province of Daghestan, and of neighboring places, was due, in a great measure, to his exertions; and after having been raised, in 1821, to the rank of commandant of a Mingrelian regiment, he was appointed governor of the province of Iméria, in Transcaucasia, which office he held from 1825 to 1827. In 1828 he distinguished himself by the active part which he took in the storming of Akhalzikh, in Georgia; and on being appointed commandant of this fortress, he

exhibited great bravery in holding out, in March, 1829, with a small number of soldiers, for 10 days, against the superior forces of the Turkish army under Achmet Pasha. Subsequently, he presided over the newly organized Transcaucasian Russian government of Armenia, and concluded, in 1835, a boundary treaty with Persia. From 1838 to 1840 he officiated at Tiflis as member of the Transcaucasian administration, and after acting for some time as commandant of the fortress of Zamosz, in Poland, he returned in 1844 to the Caucasus, and achieved, in Oct. 1846, a victory over Shamyl. In Nov. 1847, he became president of the civil government and of the administrative council of Transcaucasia. In 1853, on the outbreak of the war with Turkey, he was called upon, by the old Gen. Woronzoff, to take part in it. On Dec. 1 of the same year, he prevented the Turks from invading Armenia by defeating the forces under Abdi Pasha; and on Aug. 5, 1854, he achieved a much more important victory over Zarif Pasha, at Körük-dere, although the Turkish army was over 40,000 strong, and his own only about 20,000. However, he incurred censure for not following up this victory by marching on Kars, and in 1855 he was relieved from his command by Mouravieff, and returned to Tiflis, to resume his duties as president of the administration. Subsequently, he baffled Omar Pasha's attempt to penetrate into Mingrelia, and for a short time he again replaced Mouravieff in the command of the Caucasian army, until the arrival of the commander-in-chief, Prince Bariatski. He was promoted to the rank of lieutenant-general in 1848, and of general of infantry in 1857.

**BECCAFICO**, the *sylosia hortensis*, or fig-pecker, a singing bird which feeds upon insects, figs, currants, and other fruits, and belongs to the order of *syloviada* (warblers), and is found in some English and even Scotch counties, but chiefly in southern Europe. It has a voice like a nightingale, lurks shyly in the thickest foliage, flies with singular grace, was eaten with much delight by the ancient Romans, and still is one of the most delectable morceaux on Italian, Grecian, and French tables, especially in Venice. Their usual market price is about \$1 apiece, but they frequently sell as high as \$3 and \$5. An annual feast made on beccaficos is called *Beccaficata*. The term *beccafico* is applied in continental Europe, rather indiscriminately, to different kinds of sylvan warblers, when they are fat and in condition for the table.

**BECCAFUMI**, **DOMENICO**, an Italian artist, born at Sienna, in 1484, died at Genoa, March 18, 1549, whose real name was Mecherino, adopted the name of his benefactor, Beccafumi, who, struck with the talent which he displayed while pursuing the humble calling of a shepherd in drawing the figures of the sheep upon the sand, placed him in the studio of a Venetian. He studied at Rome the works of Michel Angelo and Raphael, and on his return to Sienna, executed a number of bronze statues and base-re-

liefa, and the mosaic of the pavement of the cathedral.

**BEOCARIA**, CESARE BONESANA, marquis of, an Italian economist, born at Milan, March 15, 1738, died Nov. 28, 1794. His education commenced in the Jesuit college at Parma, which he left at the age of 17. He at once devoted himself to the study of Condillac, Helvetius, and the French encyclopædists, but soon found his master in Montesquieu, whose *Lettres Persanes* are said to have revealed to him his vocation. His first work, "Of the Abuses of the Coinage in the State of Milan, and their Remedies," was called forth in 1762 by a commercial crisis. Soon afterward, he formed a literary club, from which issued in 1764 and 1765 the *Caffè*, a periodical on the plan of the "Spectator." Among the papers contributed by Beccaria, was one upon style, wherein he attempts to prove that all men may, with equal culture, become equally successful in literature. The first portion of a more elaborate work in support of these views was published in 1770, but never completed. The essay upon crimes and punishments, printed in 1764, made Beccaria's reputation. "Never did so small a book," says the *Biographie Universelle*, "produce so great an effect." It went through numerous editions, and was translated into almost all the languages of Europe, including modern Greek. Diderot wrote notes, and Voltaire a commentary upon it. Baron Grimm called its author "one of the best heads in Europe," and spoke of him, as "one of the few books that make men think." The academy of Bern struck a medal in honor of the marquis, and Catharine II. of Russia offered him an honorable station at her court. The essay upon crimes and punishments merits notice as the first work of its kind in modern times. It is more valuable as a criticism upon existing systems of penal law, and a statement of the principles which should guide in their reformation, than as an attempt to construct a system. Important problems in the ethics of crime are, however, touched upon, principles of evidence are laid down, and the spheres of judges and legislators respectively are discriminated. Among the most remarkable chapters in the book is that upon torture, wherein the practice, then in vogue, is severely ridiculed. "The problem may be better resolved," he says, "by a mathematician than by a judge, and may be thus stated: The force of the muscles, and the sensibility of the nerves of an innocent person being given, it is required to find the degree of pain necessary to make him confess himself guilty of a given crime." In another chapter, Beccaria declares himself opposed to capital punishment, and argues the point at length. He sums up his book with the following general theorem: "That a punishment may not be an act of violence of one or of many against a private member of society, it should be public, immediate, and necessary; the least possible in the case given; proportioned to the crime and determined by the laws." The opin-

ions broached in this book became the property of Europe, and produced a marked impression upon its criminal jurisprudence, reforms greater or less in scope being soon afterward made in the penal codes of Russia, Austria, Tuscany, and Denmark. In 1768, the marquis was appointed to a professorship of public law and economics at Milan, specially created and endowed for that purpose by Count Firmiani, then governor of that part of the Austrian dominions. His lectures, which attracted much notice at the time, were published after his death in a compilation of Italian writings on political economy. He is an advocate of the *laissez faire* system, and some striking coincidences have been remarked between these lectures, both in style and doctrine, and Adam Smith's "Wealth of Nations." In 1771, Beccaria was appointed a member of the supreme economic council, whence he was transferred to the magistracy of state, and subsequently to the board for reform of the judicial code. Such of his state papers as are preserved, are characterized by the clearness and precision which mark all their author's writings. In one of them it is for the first time proposed to use the decimal system in the application of that base for exact measurement which is derivable from the celestial bodies. Beccaria, though so bold as a writer, was exceedingly timid as a man. He wrote to his friends that, "although he was the apostle of liberty, he preferred not to be its martyr." He was twice married and died of apoplexy. His grave remains, it is said, without a name or an epitaph.

**BEOCARIA**, GIOVANNI BATTISTA, an Italian mathematician and chemist, born at Mondovì, Oct. 3, 1716, died at Turin, May 27, 1781. He taught successively in the universities of Rome, Palermo, and Turin. The experiments of Franklin had at this time called the attention of the learned to the phenomena of electricity, and in 1753, Beccaria published a treatise on natural and artificial electricity, which was highly praised by Priestley. His subsequent and most important work, *Dell' elettricismo artificiale*, was translated into English by Franklin himself. In 1759 he was appointed by the Sardinian government to measure a degree of the meridian in Piedmont, and published the result of his labors in his *Gradus Taurinensis*. He also wrote many small treatises on electricity.

**BEOCLES**, a market town of England, founded in 1869. It is richly ornamented with sculpture, and contains several public buildings. The inhabitants maintain a good carrying trade in coals and corn, and are extensively engaged in the making of malt.

**BEOERRA**, GASPAR, a Spanish sculptor and fresco-painter, born at Baza, in Andalusia, in 1520, died 1570, studied under Michel Angelo at Rome, and executed, on his return to Madrid, several works in fresco for the palace, and adorned many churches. His master-work is a statue of the Virgin, made by order of Isabella de Valois.

**BECHER, ALFRED JULIUS**, one of the principal leaders in the Vienna revolution of October, 1848, born at Manchester, in England, in 1803, and shot by order of the Austrian government, Nov. 23, 1848, at Vienna. His father, a wealthy English merchant, took him in early life to Germany, where he studied law at Heidelberg, Göttingen, and Berlin. From political causes, he became obnoxious to the Prussian government, and was for some time subjected to imprisonment. On recovering his liberty, he practised law for some time at Elberfeld, and edited a mercantile paper in Cologne, but his love of art drew him to Düsseldorf, where he remained until he received an appointment as professor of music at the Hague. His services in that capacity obtained for him a call to his native country, and in 1840 he entered upon his duties as professor of a musical academy in London. In 1845, a lawsuit made it necessary for him to visit Vienna. In the artistic and literary circles there, Becher was in his element. He wrote musical and artistic criticisms for the papers. When the revolution of 1848 broke out, he became a member of the democratic central committee, and in coöperation with the leaders of the other democratic committees, he edited the "Radical," a paper which existed from June 16, 1848, until the storming of Vienna. After Windischgrätz got possession of the city, Becher was arrested, sentenced to death on Nov. 23, chiefly upon the evidence of his participation in the publication of the "Radical," and shot on the morning of Nov. 23, in the Stadtgraben, before the Neuthor in Vienna.

**BECHER, JOHANN JOACHIM**, a German chemist, born at Spira, in Rhenish Bavaria, in 1625, died at London in 1689. Although he had to struggle with many adverse circumstances, he acquired an extensive knowledge of medicine, physics, and chemistry, became professor at Mentz, and, in 1660, imperial councillor at Vienna, and first physician to the elector of Bavaria. His attention being also directed to politico-economical subjects, and particularly to the means of increasing the revenues of the state, he contributed, while at Vienna, greatly to the establishment of several manufactories, a chamber of commerce, and an Indian company. But the jealousy of some members of the Austrian government frustrated all his efforts. This jealousy he also experienced at Mentz, Munich, and in Würzburg, and he betook himself to Haarlem; but new misfortunes forced him to seek refuge in London, where he died. He was a man of original, but irregular, genius.

**BECHER, SIEGFRIED**, an Austrian political economist, born Feb. 28, 1806, at Plan, in Bohemia. He studied law, entered the public service, and in 1835 became professor of history and geography at Vienna. His "Manual for the Study of History," which appeared in 1838, and his "General Geography," for the use of schools, which appeared in 1842, and kindred publications, contributed to increase his reputation,

which was still more strengthened by the publication of a comprehensive history of the Austrian mint and currency. On the formation of a new cabinet in May, 1848, he became chief secretary of Doblhoff, the minister of commerce. In September of the same year he was appointed member of the states council, and when Doblhoff withdrew from office, in October, he officiated as minister until Dec. 1848.

**BECHSTEIN, JOHANN MATTHIAS**, a German ornithologist and forester, born at Waltershausen, in the duchy of Saxe-Gotha, in 1757, died in 1822. He studied theology at the university of Jena, but his tastes led him to the pursuits of the chase, and to the study of animals and plants. Having visited the most celebrated hunting-grounds of Germany to observe the methods practised in them, he opened at Kemnade a school of forestry, and published a journal, entitled the "Diana," devoted to hunting intelligence and kindred matters. In 1800, the duke of Saxe-Meiningen appointed him director of his academy of forestry, and placed at his disposal his forests, a menagerie, and a pheasantry. Bechstein left many works upon the subjects to which he devoted his life, among which is a "Natural History of Germany," especially valuable in the department of ornithology.

**BECHUANA** (in the singular *Mochuana*, from *chuana*, free, with a personal prefix), a widely extended people in southern Africa, occupying the southern and south-eastern portion of the interior, divided into numerous tribes which closely resemble each other in physical features, in manners, customs, and superstitions, and which in these respects are distinguished, though not strongly, from their eastern neighbors, the Caffres. Their complexion is for the most part a coffee-colored brown, that of the Barolong tribe being the lightest. They are of medium size, symmetrically built, and have the crisped woolly hair which so generally marks the negro. They are of a gentle and unwarlike character, and their numerous feuds rarely have a bloody issue. Their weapons are only a light spear and a short shield, and they are often subjected, without offering much resistance, by their warlike neighbors, the Koranas and Caffres. Yet they are intelligent, manifest a love of independence, and surpass the Caffres in diligence and skill in manual labor. Slavery hardly exists among them. They are rich in sheep and goats, but possess fewer horned cattle, which, however, especially cows, they prize very highly. Where the soil permits it is diligently cultivated, and some of the tribes have considerable industry. They have some notion of deity, but temples, idols, priests, and consecrated objects are almost wholly wanting, though monkeys, snakes, and crocodiles are sometimes worshipped. They affirm that they originally sprang from a cave, which is still pointed out in the Bakoni country, and where the footmarks of the first man may be still seen in the

rocks. Their faith in the supernatural power of a class of wizards, termed rain-makers, one of whom at least is found in every tribe, they share with the other peoples of southern Africa. Polygamy exists to an unlimited extent, and circumcision is a general usage. Christian missionaries have obtained access to several of the most western tribes, and by their influence the women, who formerly performed all the agricultural work, have been relieved from the heavier tasks, only the labor of hoeing, driving away birds, reaping, and winnowing now falling to them. The government of the Bechuana is both monarchical and patriarchal, and of a mild character. Every tribe has its chief or king, who resides in the largest town, and is held sacred by reason of his hereditary right to that office. Under these chiefs are the heads of particular districts and villages, and again under these are the *cosi*, or wealthy men, who form the aristocracy of the nation. The power of the princes is very great, but is limited by the general assembly, called the *piche*, of the subordinate chiefs. The Bechuana formerly extended south as far as the Orange river, but were there met and driven back by the Hottentot races. At a recent period the Caffres made an incursion from the east deep into the Bechuana territory, devastated the country, destroyed cities, many of which had a population of 20,000, and effected for the time a complete political and social transformation. Some of the tribes were totally annihilated. More recently the Boers, or Dutch settlers, have founded establishments, one of which is known as the Orange River republic, within the boundaries of the Bechuana. Among the most important and best known of the Bechuana tribes are the Basuto, which is the most easterly of them, occupying a table-land to the west of the Drakenberg mountains, partially civilized and Christianized, and whose capital, Thaba-Bossiu, has a population of 13,000; the Batlapi, among whom missionaries have had the greatest success, dwelling in a parched region, almost destitute both of wood and water, on the borders of the Kalahari desert, with Mamusa for their capital, their former principal city, Lithaco, being now depopulated; the Barolong, dwelling to the north of the preceding, formerly powerful, but now scattered and almost extirpated by the Caffres; the Bangwaketse, dwelling still further to the north, in a beautiful, fruitful, and well-cultivated valley, who were formerly wealthy, but have suffered severely from the incursions of the Caffres; the Bahurutse, dwelling westward from the preceding, in one of the finest districts of southern Africa, who had considerable industry in agriculture and raising cattle, till they were driven by the Caffres from their country, which, in 1837, was taken possession of by the Boers; the Batoana, dwelling on the northern coast of Lake Ngami, the remnant of the former powerful tribe of Bamangwato; the Bakwains, who occupy the fine hilly regions

along the rivers Notuani and Mariqua, and who have suffered from the Boers; and the Balaka, who are not of Bechuana stock, but, like the bushmen of the Hottentot race, live scattered among various tribes, and are generally despised. Under the name of Bakalahari, the Balaka dwell in great numbers in the Kalahari forest. The Bayeye, who dwell upon the borders of Lake Ngami, are also to be distinguished from the Bechuana. The latest and fullest information concerning the tribes of southern Africa is contained in the "Travels and Researches" of Livingstone.

BECK, DAVID, also BEEK, a Dutch portrait painter, one of the ablest scholars of Vandyke, born at Arnheim in 1621, died at the Hague in 1656. He painted with so much rapidity, that Charles I. of England, who employed him, exclaimed: "Faith, Beck, I believe you could paint riding post." Queen Christina of Sweden employed him in painting the portraits of the European sovereigns for her gallery, but chiefly her own portraits, which were then circulated all over Europe. He travelled extensively, and while once in Germany he was taken so ill that his servants thought he was dead, and prepared him for the grave, while they cheered themselves up in this melancholy labor by resorting to the bottle. One of the party poured, in a frolic, a few drops of wine into the mouth of what he considered to be the corpse of his master, when, to his surprise, the corpse began to revive under the effect of the wine, and was gradually restored to life. When he subsequently died at the Hague, his death was ascribed to poison.

BECK, GEORGE, a painter and ingenious writer, born in England in 1749, came to America in 1795, died at Lexington, Ky., Dec. 24, 1812. He was appointed professor of mathematics in the royal academy at Woolwich in 1776, on account of his reputation for ability in that department, but lost the office for not discharging its duties. After coming to America, he was employed in painting, by Mr. Hamilton, of the Woodlands, near Philadelphia. He was also a poet, and, beside his original pieces, translated Anacreon and large portions of Homer, Virgil, and Horace.

BECK, JOHN BROADHEAD, an American physician, born in 1794, died at Rhinebeck, N. Y., April 9, 1851. He graduated at Columbia college in 1813, at the head of his class, commenced practice in 1817, in the city of New York, and soon rose to distinction. In 1826, he was appointed professor of materia medica and botany in the college of physicians and surgeons, but exchanged it for that of medical jurisprudence, which he held at the time of his death. He published essays on medical subjects, and was associated with his brother, T. Romeyn Beck, in the publication of the great work on "Medical Jurisprudence."

BECK, LEWIS O., a distinguished American naturalist, born at Schenectady, N. Y., 1800, died at Albany, April 21, 1858. He graduated

at Union college, in 1817. In 1830 he was appointed professor of chemistry and natural history in Rutgers college, New Brunswick, N. J., and at the time of his death was professor of chemistry in the Albany medical college. His attainments in natural history were remarkable, and he published works on chemistry, botany, the "Report on the Mineralogy of New York," and an account of the salt springs at Salina, which appeared in 1826.

BECK, THEODORIC ROMEYN, M. D., LL. D., born at Schenectady, N. Y., Aug. 11, 1791, died Nov. 1855. He graduated at Union college in 1807, studied medicine, and, in 1811, opened an office at Albany. In 1815 he was appointed professor of the institutes of medicine and lecturer on medical jurisprudence in the college of physicians and surgeons of the western district of New York. In 1817, finding his health failing, he relinquished general practice, and accepted the appointment of principal of the Albany academy, over which he presided for more than a quarter of a century. He still retained his medical professorship, and was for several years president of the state medical society, but exchanged it for that of medical jurisprudence. Dr. Beck was earnest in the promotion of all philanthropic enterprises; the deaf and dumb, the blind, the insane, the idiotic, owe much to his zealous labors in their behalf. His paper on the statistics of the deaf and dumb, exerted a powerful effect in influencing the action of the state legislature, to liberal measures for their education. He was one of the managers of the New York state lunatic asylum, from its organization, and for the last year of his life the president of the board. In 1849, on the death of Dr. Brigham, he became the editor of the "American Journal of Insanity," and continued in charge of it for 4 years. Although Dr. Beck wrote much, the greater part of his published writings were in the form of addresses, reports, and contributions to scientific journals, and he will be chiefly known to posterity by his great work on the "Elements of Medical Jurisprudence," the ablest contribution to this difficult subject yet given to the world in the English tongue.

BECKER, CHRISTIANE AMALIE LUISE, a Weimar actress, born 1777, died about 1796, admired by Wieland, extolled by Iffland, immortalized through Goethe's "Euphrosyne." She created such an enthusiasm among the *habitués* of the Weimar theatre, that many of the audience drew portraits of her during the performance, and her life and genius are invested with peculiar romantic interest from the remarkable brevity of her career, since she died before she was 20. Her development was singularly precocious; the duchess Amelia, herself, painted her in oil before she was 10. She made her debut as the "Niece," in Goethe's *Graekophia* (her most successful rôle), before she was 15, and was married soon afterward. She left one daughter, who is the present Madame Werner, the prima donna of the Leipzig

opera. Christiane won brilliant laurels as Ophelia, as Luise, and Amelia, in Schiller's "Intrigue and Love," and "Robbers," and in Lessing's *Minna von Barnhelm*.

BECKER, FERDINAND, a German pastor, born about 1740 in the little Westphalian town of Grevenstein, died at Hörter, in 1810, wrote, while canon at Paderborn, various educational books for young people, which, in the opinion of his ecclesiastical superiors, contained thoughts savoring of infidelity. As, at the same time, he made himself obnoxious to them by his advocacy of reform in the church, he was, in 1796, convicted of heresy, imprisoned in the Franciscan convent of Paderborn, and after having effected his escape from prison through the assistance of the numerous friends which the treatment to which he was subjected had made for him throughout Germany, he remained under the ban of excommunication until 1806, when he was restored to his previous position.

BECKER, GOTTFRIED WILHELM, a Leipzig physician and writer, born Feb. 22, 1778, died Jan. 17, 1854. He devoted himself to the practice of his profession and to the publication of medical writings, until 1833, when he turned to belles-lettres literature, to the study of history, and modern languages, in which he had already acquired some reputation. He translated into German some of Cooper's novels, and Silvio Pellico's *Le mie prigioni*. By his literary labors he accumulated \$40,000, to which his son, Karl Ferdinand, the organist, added a house of the value of \$7,000, appropriating the whole amount to the establishment of an educational and charitable institution for the blind at Leipzig.

BECKER, JOHANN PHILIPP, a German democrat, born at Frankenthal, in the Rhenish palatinate, March 19, 1809. His father was a carpenter, and he himself a brush-maker. He received, however, a respectable education, and after the outbreak of the French revolution of 1830, he became a contributor to Siebenpfeiffer's radical paper, *Westboten*. He became involved in troubles with the government; he was arrested, and even after he had recovered his liberty, he was obliged to withdraw to Bern, in Switzerland, where he entered into business, while at the same time he continued to write for the local radical journals. In acknowledgment of his services, during 1846, the authorities of Bern conferred upon him the rights of citizenship. In the autumn of 1847, when the Sonderbund war broke out, he officiated as field-secretary, and subsequently as adjutant of the Swiss general, Ochsenbein. In 1848 he formed a volunteer corps, and took part in the Baden revolution; the defeat of Hecker compelled him, however, to return to Switzerland. At Hünningen he organized a defensive league. He collected a body of Germans and Swiss to assist Mazzini and the other Italian liberal leaders, but this plan was frustrated by the French government, which stopped the progress of his force after its arrival at Marseilles. He was on

the point of proceeding himself to Italy, with some fellow-sympathizers, when the fresh outbreak in Baden prevailed upon him to go to Karlsruhe, where he arrived May 17, 1849. He took the command in a skirmish on June 25, near Durlach, and fought bravely there and elsewhere. When the forces of the united German governments crushed the movement, Becker returned to Switzerland. Subsequently he settled at Geneva, devoting himself again to industrial and commercial pursuits. In conjunction with Esselen, he published at Geneva, in 1849, a history of the revolution in which he had taken part.

BECKER, KARL FRIEDRICH, a German historian, born in Berlin, in 1777, died March 15, 1806. He wrote a universal history, intended more particularly for young people and for teachers, but as he completed only the first 9 volumes, a different tendency was ingrafted upon the work by Woltmann, who wrote the 10th, and by Menzel, who added the 11th and 12th volumes. In 1845, the history was brought out in a still more complete form, in 14 volumes, by Loebell, of Berlin. Although the work presents, in its present shape, a more scientific and elaborate character, yet Becker's original edition is still the most popular in schools and among teachers.

BECKER, NIKOLAUS, a German, born in Prussia, in 1816, died Aug. 28, 1845, celebrated by a national song, written in 1840, *Sie sollen ihn nicht haben, den freien deutschen Rhein*—"They shall not have it, the free German Rhine!" This song became very popular, and the king of Prussia gave Becker the means to complete his studies at the university of Bonn, and his success made him believe that he was a poet, which, however, he was not.

BECKER, RUDOLF ZACHARIAS, a popular writer, who exercised a great influence on the German people, born at Erfurt, April 9, 1752, died March 28, 1822. He first became known by an essay on the theme, "Is it useful to deceive the people?" which gained a prize from the Berlin academy of sciences, in 1799. His theory was, that "happiness depended on the gratification of an innate desire for improvement." In 1782 he took charge of a school at Dessau, and published a journal for youth. A work in 2 vols., entitled "A little book of needful Help, or Instructive Tales of Joy and Sorrow in the village of Mildheim," became such a favorite with the public that over 500,000 copies were soon disposed of. He also produced other works and journals, and the extensive transactions in them led him, in 1797, to set up a publishing and bookselling establishment at Gotha, which is still continued by his son. On Nov. 30, 1811, he was arrested by Davoust, on suspicion of conspiring against Napoleon, and imprisoned at Magdeburg, till April, 1813. On this imprisonment he wrote a book, which still has a historical value.

BECKERATH, HERMANN VON, a German statesman of the liberal conservative school,

born at Crefeld in Dec. 1801; served in the Prussian diet; in 1848 became a member of the Frankfort parliament, and minister of finance of the so-called German empire under the archduke John; was invited to become prime minister of Prussia, but declined; resigned his seat at Frankfort in May, 1849, owing to unwillingness to participate in any extreme measures; served afterward in the parliament at Erfurt, and in the 2d Prussian chamber, and withdrew to private life when Manteuffel's administration reestablished the old order of things.

BECKET, THOMAS à, archbishop of Canterbury, the Saxon hero, priest, and martyr of England in the reign of Henry II., born in London in 1119, or, according to some writers, Dec. 21, 1117, assassinated at Canterbury, Dec. 29, 1170. He was the son of a Saxon and a Syrian lady, whose union was brought about in the following extraordinary manner: Gilbert, the father of Thomas, having gone to the Holy Land, in the second crusade, was made a prisoner; but while in durance, a Syrian damsel, becoming enamored of him, and being converted by him to Christianity, contrived to effect his liberation, after which, with little chivalry or gratitude, the Saxon crusader returned home as best he might, leaving the lady by the seashore of Tyre. But, with a love and faith stronger than that of the deserted Carthaginian queen, the fair Saracen followed her recreant lover, and, although—so runs the legend—she knew but two words of any European language, the names of her lover and of the city where he dwelt, by the repetition of those two words, "London" and "Gilbert," and by the display of her tears, her beauty, her jewels, and her gold, she at length made her way to the already famous metropolis, and there, with well-deserved good fortune, found her Gilbert, both free and willing to reward her undoubting trust by taking her to his home and to his heart.—Of so strange a union Thomas was the offspring; but, if possible, his own fortunes were stranger yet. He was at first educated by the canons of Merton, and continued his studies in the schools of Oxford, London, and Paris. On the death of his father, he was admitted into the family of Theobald, archbishop of Canterbury, and, with his permission, went to the continent for the purpose of studying the civil and canon law. He attended the lectures of Gratian at Bologna, and of another celebrated professor at Auxerre. Concerning his early life little more is known; but it is recorded that his first appearance at the court of Henry was made in the humblest guise, bearing his fortunes on his back, in the shape of not too sumptuous a garb, riding a spavined jade with galled withers and bare ribs, which moved the insolent mirth of the Norman courtiers. He soon, however, obtained high favor with the king, who, it was alleged, was in some sort under obligation to him, as if he, acting as agent for Theobald, had obtained from the pope letters prohibitory of

the coronation of Eustace, the son of Stephen of Blois, which prohibition ultimately led to the succession of Henry himself to the throne. However this may be, in 1158 he was appointed high chancellor and preceptor of Prince Henry—afterward King Henry III.,—being the first Englishman called to any high office after the conquest. From this time, he became the intimate associate, boon companion, and familiar friend of the king, whose private hours, as well as his most secret counsels, he shared, and of whom he was no less the master of the revels than the keeper of the conscience and the purse. In 1162, on the death of Theobald, he was ordained priest, having been before only in deacon's orders, and the next day consecrated archbishop of Canterbury. So soon as he obtained what had evidently been, from the beginning, the object of his aim, the primacy of England, he at once threw aside the robes of the courtier, and assumed the hair-cloth shirt of the austere prelate. The very year after his consecration, he repaired to the general council, which was held by Pope Alexander III., at Tours, and complained to him of the infringement of the rights of the clergy by the laity of England, which he professed himself resolute to restore. Then commenced that struggle for supremacy between the primates, backed by the ultramontane power of the pope, and the kings of England, supported by the swords of the barons, and generally by the national feeling of the English, which continued more or less powerfully to disturb the kingdom, during the reigns of all the Norman monarchs, until the church of Rome in England was finally abandoned by Henry VIII., in the 16th century.—But ambitious and able as Becket was, he was met by one almost as politic and able as ever sat on the throne of England, and as resolute to maintain, as was the other to assail, his prerogatives, and the laws of his realm. The first point at issue was the liability of the clergy to be tried by the ordinary courts, and held amenable to the ordinary laws, of the land; and this point was decided by the celebrated "Constitutions of Clarendon," passed in 1164, which have, since that time, been the law of the land. These constitutions, at first, Becket avowed that he would never accept, or accept only with some such clause of reservation—intended to neutralize the acceptance—as *salvo ordine suo*, or *salvo honore Dei*. But at length, after much hesitation, he swore to observe them, although, immediately afterward, confessing that he had committed a crime in doing so, he declared himself in a state of penance, and suspended himself from the performance of his ecclesiastical functions, until he should be absolved by the pope. Shortly after receiving this absolution, Becket again receded from his admission of obedience, and, being threatened with sundry legal proceedings in the king's courts, attempted to escape over seas, but was driven back by stress of weather. From this time the struggle became more bitter

and acrimonious on both sides; judgments were obtained, and fines and imprisonments decreed against Becket; but, treating them all with contempt, he held laws, king, and courts at defiance; appealing to the pope against Henry, and finally personally braving the monarch, face to face, in his own presence chamber. At length, however, all his suffragan bishops, except Jocelyn of Salisbury, and William of Norwich, appealing against him, in the king's behalf, to Rome, and the barons of the realm having ordered his apprehension and imprisonment, he escaped, under a feigned name, to Normandy. Here he continued nearly 7 years, in a sort of honorary exile, the pope declining to insist on his restoration to the see of Canterbury, but, after 2 years, appointing him to the rich abbey of Senon, which exasperated Henry to such a degree that he issued letters of confiscation and banishment against all the kindred, male and female, of Becket, and caused them all to be transported and discharged, penniless, only with the clothes in which they stood, at the gates of his episcopal residence. In retaliation for this, Becket procured from the pope, first, the excommunication of the bishops who had rebelled from his authority; then that of all those who had signed the constitutions of Clarendon, or submitted to them; and, lastly, that of the king himself and the whole kingdom of England, in case he should refuse to reinstitute him in his dignities. While the interdict was yet in suspense, Henry II., who was resident in his Norman dominions, determined to have his son crowned Henry III. of England, during his own lifetime, and issued orders to this effect to the archbishop of York, who, during the suspension of the primate, performed his offices as the first English ecclesiastic. Letters prohibitory were immediately issued from Rome, forbidding the consecration of the prince; but whether, as it has been alleged, they arrived too late, or whether the English bishops coincided with the nation against foreign ecclesiastical control, they were of no avail, as Henry III. was duly crowned, with or without the consent of the pope, at Westminster. Henry II. found, however, that Louis of France was intermeddling in the matter, and that, in case of the promulgation of the interdict, he would, not improbably, follow it up by a declaration of war; wherefore he considered it the better policy to make up the difference, and, Becket condescending to go through some form of submission, to reinstate him in his primacy, and restore to him his "pristine state and dignity," as the old chronicle has it. At the first meeting of conciliation, at Freitville, on the borders of Touraine, in 1170, when Becket tendered the kiss of peace to the king, "I give it to you," he said, "*salvo honore Dei*." The rage of Henry can be imagined, as this very phrase of reservation had been the bottom of the original difference; but he dissembled his indignation, and despatched him home with letters to his son, ordering his reinstatement in peace to all his

dignities and properties, and commanding, also, the restoration to all his clerks and others, who left England on his behalf, of all their confiscated properties. Scarcely, however, had he entered the realm, before he proceeded at once, in virtue of his office, to suspend the archbishop of York, and all the other prelates who had assisted in the coronation, from every office of their episcopal dignities, having provided himself with a papal rescript fully empowering him to do so. The suspended prelates were the archbishop of York, and the bishops of London, Salisbury, Exeter, Chester, Rochester, St. Asaph, and Llandaff, beside the others who had assisted at the coronation. Thereupon the officers of Henry III. commanding him in the king's name to absolve the excommunicated bishops, he consented to do so, on their making submission, and swearing to abide by all the commands of the pope. The bishops, however, refusing to take any oath of the kind, without the king's consent, he remained obdurate, and the prelates, crossing the sea, carried their grievances direct to the foot of Henry's throne. In the mean time, Becket set out "to visit the young king at Woodstock, but was met by messengers, who, in the king's name, commanded him to proceed no further, but to return to his church. He accordingly returned to Kent, and there made preparation to celebrate the season of Christmas, which was approaching."—The old king, Henry II., was holding high festival and banquet in the halls of Rouen, when the excommunicated prelates arrived, bearing the tidings of their own disgrace, and of the action of Becket; adding that the primate was marching to and fro throughout the kingdom, at the head of armed bands of foot and horsemen, and was stirring up the Saxon churls against the gentle blood of Normandy. Henry swore his favorite oath, "By the eyes of God," that if all were accursed who had consented to his son's coronation, he was so himself, and added an exclamation of passionate wonder that, among all his knights and nobles, he had not one who would rid him of that shaveling. Thereupon, 4 Norman barons, hastily leaving the presence, swore to avenge the king, and, without waiting even to change their banqueting robes, took horse and took ship, and on the 5th day after the tidings reached Rouen rode into Canterbury, themselves unarmed, at the head of 50 mail-clad men-at-arms. Their names were Reginald Fitzurse, Richard le Breton, Hugues de Morville, and William de Traci. On entering Canterbury they summoned the sheriff, and ordered him to take measures instantly to suppress any rising in the town which might occur, left 40 men-at-arms at the market-cross to overawe the people, and then rode, with 12 followers, straight to the bishop's palace. Becket was at table when they entered, and commanded him, sternly and rudely, on peril of his life, to raise the interdict and suspension of the bishops, and to submit himself to the pleasure of his sovereign lord, the king.

Argument, debate, refusal, high words, and fierce recrimination followed. The archbishop was cool, haughty, unbending, and insolent in his very calmness; the knights, fiery, untamed, and as unused to meet resistance as they were impotent to control their own fierce temper. Whether the deed were premeditated from the first or not, they acted ever with the coolest deliberation. As they rushed out to arm themselves, they ordered the monks to keep him forthcoming, that he should not flee away. "What!" quoth the archbishop, "think ye that I will flee away? Nay; neither for the king nor for any man alive will I stir one foot from you." "No," said they, "thou shalt not avoid though thou wouldst;" and so they departed in high clamor of words. The archbishop followed them out of the chamber door, crying after them, "Here, here, here shall you find me," laying his hand upon his crown. Then the 4 barons went out and armed themselves complete in mail, with their shields hung about their necks, and their two-handed swords and battle-axes. It was about evensong when they returned, and the archbishop was in the cathedral, whither he had passed by a back entrance, not as a fugitive from danger, but as a priest performing his appropriate duty. The palace gate was shut, but they forced their way in by an orchard, through an open window, which gave them access to the cloisters, and thence to the church, where, when they entered, he was engaged within the rails of the altar. They were reluctant, at first, to slay him in that holy place, and Fitzurse struck him on the back with the flat of his sword, crying, "Fly, priest, fly!" Then, turning to his comrades, he cried, "Have him away to the threshold; we may not slay him here." "Here or nowhere," cried the dauntless priest, seizing the rails of the altar, with a noble courage, which was a part of his nature. All the monks had fled, with one exception, a stout Saxon, Edward Grim, his crossbearer, who stayed to die with his master if he could not save him. As the first blow of a two-handed sword was dashed at the prelate's head, the sturdy servitor thrust out his bare arm to parry it, and, as might have been expected, it was lopped off, like a twig by a woodman's bill-hook, and fell within the chancel. Then quickly the work of blood went on. Hugh of Morville smote him on the head with a mace, and brought him to his knees, and the thirsty blades of the others met in the skull of the unflinching martyr to his faith. The cry, "Thus perish all the foes of the gentle Normans," reveals the true intent of the barons, and discloses the secret of this summary execution. It was not so much the bold priest defending the immunities of his church, assailing the prerogatives of his king, whom they struck down, as the Saxon who dared endeavor to uplift the caste of his degraded Saxon countrymen. His death, as such deeds ever do, advanced his cause more than the longest life ever vouchsafed to man could have done, had it been all de-

voted to that one object. He was the Saxon martyr; canonized, he became the Saxon saint—the most popular of all the saints in England, especially among the lower orders, to whom he was doubly endeared by his Saxon origin, and by his cruel and cowardly slaughter at the hand of Normans. His shrines, at which miracles were believed to be wrought, were the richest shrines in England; and it was the gold and jewels which adorned them—2 large coffers of which were carried to the royal treasury, after the saint's personal property had been forfeited to the crown, consequent to the judgment passed on him by default, for non-appearance in court, nearly 4 centuries after his burial—that induced the rash monarch, Henry VIII.—not, as he alleged, the desire to deter other saints from following so bad an example—to proceed against him for treason to his ancestor of some 14 generations before.

BECKFORD, WILLIAM, an English politician, born 1690, in the West Indies, died at Font-hill, Wiltshire, June 21, 1770. He possessed large estates in Jamaica, and greatly increased his property by commercial pursuits, in the city of London. In 1746 he was returned to parliament by the borough of Shaftesbury, and subsequently sat for London. He strongly supported the liberal interest, was the friend and adherent of Wilkes, and advocated all the popular measures brought forward in his time. Having introduced a bill to prevent bribery at elections, which was vehemently opposed by Mr. Thurlow (afterward lord chancellor), Mr. Beckford briefly replied, "The honorable gentleman in his learned discourse first gave us one definition of corruption, then another, and I thought at one time he was about to give us a third; but, pray, does he imagine that there is a single member of this house who does not know what corruption is?" He was successively alderman, sheriff, and lord mayor of London. This last dignity he held twice, and, during the second time (in 1769-'70), the occurrence took place which has chiefly made his name remembered. The city of London has the right, enjoyed by no other city corporation in England, and shared only with both houses of parliament, and the universities of Oxford and Cambridge, of presenting addresses to the king, to be received by his majesty in person and state. When Wilkes was liberated from prison, in 1770, the city of London presented a series of addresses to George III. First was a petition for the dissolution of parliament, and protesting against every vote of the house of commons as invalid, since it had expelled Wilkes; then a remonstrance yet more strongly worded, to the same effect, and especially inveighing against "secret and malign influence" (that of Lord Bute) at court. The king replied to this, as advised by his ministers, in terms of strong displeasure. The house of commons, in a resolution passed by a large majority, condemned the language of the city to the king. Lastly, as a climax, came a second

remonstrance still more vehement, which, if not actually written by Lord Chatham, was entirely approved by him, again calling for a dissolution of parliament; still complaining of secret influence, calling for the dismissal of the ministry, and strongly animadverting on the tenor of the king's former reply. This was presented at St. James's in state, May 23, 1770, by Lord Mayor Beckford, attended by a deputation. In compliance with custom, a copy of the intended address had been previously sent to court, so that the royal answer might be prepared. This was brief and strong, repeating the king's dissatisfaction with the manner in which he had been addressed, and declaring his sentiments to be unchanged. Instead of retiring, Beckford stepped forward, asked leave to say a few words, and, king and courtiers being alike taken by surprise, proceeded to declare, boldly but respectfully, that the king had no subjects more loyal or more affectionate than the citizens of London, and concluded thus: "Permit me, sire, to observe that whoever has already dared, or shall hereafter endeavor, by false insinuations and suggestions, to alienate your majesty's affections from your loyal subjects in general, and from the city of London in particular, is an enemy to your majesty's person and family, a violator of the public peace, and a betrayer of our happy constitution, as it was established at the glorious revolution." The king made no reply to this. Horace Walpole, writing the next day, spoke of "my lord mayor's volunteer speech," as being "wondrous loyal and respectful." Mr. Gifford declared that Beckford "never uttered one syllable of the speech." But there can be no doubt that he did break through etiquette and make a sharp answer to the king, though, as Lord Mahon suggests, "there is great reason to think that in the hurry of his spirits at the time he did not really utter all that he intended or supposed." He informed the city, two days after, that he had spoken the words now attributed to him, and his conduct was approved by a large majority of the common council. In less than a month from that time he died from a violent fever into which, it is said, his blood had been thrown by the agitation of his mind. The city voted that his statue should be placed in their Guildhall, with his speech to the king engraved on the pedestal, as may be seen to this day. It is said that Beckford spoke "what was prepared for him by John Horne Tooke, as agreed on at a dinner at Mr. George Bellas's, in doctors' commons." Tooke himself claimed the authorship, and Mr. J. W. Croker, in a note on Dr. Johnson's question, "Where did Beckford learn English?" suggests: "Perhaps Beckford said something which was afterward put into its present shape by Horne Tooke." It is pretty clear that Beckford could scarcely have made the speech himself. Lord Mahon says he was "a man of neglected education, noted in the house of commons for his loud voice and faulty Latin."

BECKFORD, WILLIAM, author of "Vathek," the only legitimate son of the preceding, born in 1760, died May 2, 1844. He inherited from his father an income, said to have exceeded \$500,000 a year. His talents were precocious, he read deep, and, as he himself relates, was capable of enduring great fatigue and prolonged study. Before he was 20 he wrote "Biographical Memoirs of Extraordinary Painters," published in 1780. In 1783 he married Lady Margaret Gordon, daughter of the earl of Aboyne. In 1784 he wrote, in the French language, the most remarkable of his works, "Vathek," an eastern tale of wonder. He never translated it, but there subsequently appeared in English a version which he approved and declared to be faithful to the spirit of the original. In 1794 he went to Portugal, and built a magnificent mansion at Cintra, in which he lived for several years, but which, after he left it, was suffered to go to decay. His father had erected an enormous pile at Fonthill, at a cost of £150,000, but even its splendor did not satisfy the prodigal inheritor of his wealth, and this palace he proceeded to pull down, leaving but a small portion of it remaining, and erected Fonthill abbey, on which he spent fabulous sums, and which, for many years, remained entirely closed to the public, a monument of mystery, folly, and selfishness. In 1822, having suffered great losses in his Jamaica estates, by the prospective emancipation of the negroes, he was obliged to sell Fonthill abbey to Mr. Farquhar, and, soon after, the central tower, more than 260 feet high, fell and crushed a large part of the mansion. At Bath he built, on Lansdowne hill, a more singular creation than Fonthill, and here he spent the remainder of his life. His passion for towers induced him to build one at the Bath erection, and, being gifted with extraordinary powers of vision, he saw from its top that that of Fonthill had disappeared from the landscape, although it was 40 miles distant, and proclaimed the fact, before the news of its destruction arrived from the scene itself. On his death he left 2 daughters, one of whom is the present dowager duchess of Hamilton.—Few characters have ever been the subjects of more speculation, either from the force of their talents, or the adventitious circumstance of boundless fortune, than Beckford; and that mystery which was thrown around him early in life, attached to him, by the popular estimation, to the last. The powerful impression produced by "Vathek," its pictures of gorgeous magnificence, its supernatural machinery, the gloomy grandeur of the hero of the story, surrounded by all earthly splendor, yet consorting with powers of darkness, not only established the literary fame of the author, but, in the estimation of the multitude, who never came in contact with him, and looked with wonder upon his imposing piles of building, springing like magic into existence, invested him with weird attributes which had no sympathy with daily human life. The credulous, as they saw the vast tower of

Fonthill abbey rising over the domain which no stranger was permitted to enter, half believed that its lord, who dwelt apart from mankind, as secluded as an eastern despot, kept companionship with beings of unearthly mould. Such an idea was possibly accounted for by the fact of Beckford's having, at one time, attached to him a hideous and enasculated oriental dwarf, such as is frequently found in the households of Asiatic princes. By his equals in rank he was regarded as a man of uncommon talents and peculiarities. On Fonthill he poured out his riches with apparently exhaustless profusion. The estate and abbey cost him nearly \$2,000,000. He began the erection of the huge fabric in 1796, and it was 11 years before he moved into it. Many anecdotes are told of his extravagance in connection with its progress, no obstacle ever being allowed to remain in his way for one moment that could be removed by money. Double sets of hands were employed to work day and night, in hours of darkness by torchlight, and paid so high for their labor that the workmen were induced to quit the repairs going on at Windsor castle. The central tower was 267 feet in height, crowned by a lantern, enclosed with single sweeps of plate glass. When the tower was first in progress, it had attained a lofty height, and, on some gala day, a large flag was hoisted upon the top of it. The work had been constructed in such haste, that the wind, acting with great force upon the banner, exerted such a leverage upon the staff that the pile was overthrown, and fell to the earth with a mighty crash. Merely observing that it must have been a grand sight, and regretting that he had not been present, Beckford gave an instant order for the construction of another tower. In his "palace of pleasures," which now might almost rival the fabled hall of Vathek, Beckford, in some strange freak, secluded himself. His immense wealth enabled him to gratify every whim, and he made an unrivalled collection of works of art and virtu. Immense vestibules, halls, galleries, drawing-rooms, oratories, suite upon suite, were filled with palatial furniture, pictures, carvings, gems, porcelain of the rarest fabric, of which a superb set for every day in the year, and used but once in a twelvemonth, literally crowded the gorgeous saloons. None were permitted to behold these riches but at very rare intervals, and they emerged from the pile to speak of the magnificence within, equalling in dazzling reality the wildest fables of Arabian romance. On one occasion the most famous duchess of the realm was admitted, entertained for a week with princely generosity, the delights of the place varying from day to day, but the inexorable Beckford never entered her presence. At length, in 1822, Fonthill passed out of his hands, and the treasures it contained were scattered, in a sale of 41 days' duration. Thither from every part of the kingdom flocked thousands to gratify their curiosity by a sight of the palace from which they had always been so rigidly excluded, and

to secure some of the dazzling objects with which it was filled in every part—paintings by the greatest of the old masters, the costliest books and illuminated manuscripts, magnificent cabinets of buhl, ebony, and mosaic, porcelain statuary, specimens of ivory carvings by Flaminio and other great artists, and numerous sculptured vessels, of topaz, sardonyx, agate, and crystal, some of them the most exquisite works of Benvenuto Cellini.—The literary fame of Beckford rests upon his early writings. His travels, in a series of letters, published more than 50 years after they were written, contain some of the most animated descriptions, and especially of natural scenery, in the English language. "Vathek," in spite of its grotesque horrors, is likely to remain long a favorite, and bears the impress of great powers. Byron says of it: "'Vathek' was one of the tales I had an early admiration of. For correctness of costume, beauty of description, and power of imagination, it far surpasses all European imitations, and bears such marks of originality that those who have visited the East will find some difficulty in believing it to be more than a translation. As an eastern tale, even *Rasselas* must bow before it; his 'happy valley' will not bear a comparison with the 'hall of Eblis.'"

BECKINGTON, THOMAS, bishop of Bath and Wells in 1443, an English theologian and diplomatist, born in Somersetshire in 1385, died Jan. 14, 1465. He was educated at New college, Oxford. He drew up cases against the Lollards and in favor of his master, Henry VI.'s right to the French crown. He was one of the plenipotentiaries appointed to negotiate a peace with France, 1482.

BECKMANN, JOHANN, a writer on agriculture and natural history, born at Hoya, Hanover, June 4, 1739, died at Göttingen, Feb. 4, 1811. He studied theology at Göttingen, but soon applied himself to natural philosophy and chemistry. For a short time he was professor of natural philosophy and history at a gymnasium in St. Petersburg. He resigned this, and coming back through Sweden, made the acquaintance of Linnæus, and was allowed to see how the Swedish mines were worked. Having returned to Göttingen, he was made professor of philosophy there in 1766, and, in 1770, ordinary professor of economy, which office he held for over 40 years. He published several scientific works, which once were popular, but the best known of his productions is called "Contributions to the History of Discovery and Inventions," of which several translations have been published in England, where (with corrections and additions extending it to the present time) it continues to be a favorite work.

BECLARD, PIERRE AUGUSTIN, a French surgeon, born at Angers, Oct. 15, 1785, died at Paris, March 16, 1825. While yet young he became surgeon-in-chief to the *hôpital de la charité*, at Paris. In 1818 he was placed in the anatomical chair at the school of medicine. He died suddenly of brain fever.

BEOQUEREL, ANTOINE OÉSAR, a French natural philosopher, born at Châtillon-sur-Loing, March 7, 1788. At the age of 18, he entered the polytechnic school, leaving it in 1808, with the grade of an officer, and in the corps of military engineers. He was with the French army in Spain from 1810 until 1812, and distinguished himself at the siege of Tarragona. In 1818 he was attached to the general staff. In 1815, at the downfall of Napoleon, he left the army with the grade of major. In 1819 he commenced the publication of some papers on mineralogical and geological researches, with reference to several kinds of calcareous carbonates, but the investigation of electrical phenomena gradually claimed his whole attention. In studying the physical properties of amber, he was led to make some experiments on the discharges of electricity by means of pressure; and that was the starting point of all his subsequent investigations. He then observed the evolutions of electricity in every kind of chemical action, and discovered the laws of the effects produced. These researches led to the refutation of the "theory of contact," by which Volta explained the action of his pile or battery, and to the construction of the first electrical apparatus with a constant current. The discoveries in electricity made by Becquerel have been published in the *Annales de physique et de chimie* and in the *Mémoires de l'académie des sciences*. His investigations enabled him to discover a very simple method of determining the temperature of the interior organs of men and animals, without producing wounds of any consequence. He made numerous physiological applications of this method, and discovered that whenever a muscle is contracted a certain amount of heat is evolved. Becquerel is also one of the creators of electro-chemistry. In 1828 he made use of this new science in the production of mineral substances, and in treating, by the humid process, the ores of silver, lead, and copper. For these researches he was elected member of the royal society of London; and in 1829 member of the French academy of sciences. In 1832 he was elected member of the institute of France; and since his admission, he has read before that learned body more than a hundred papers on important questions. In 1837 the royal society of London awarded him the Copley medal for his numerous discoveries in science. Among the list of new substances which Becquerel obtained by the slow action of electricity may be mentioned aluminum, silicium, glucium, crystals of sulphur and of iodine, and numerous metallic sulphurets, such as dodecahedral pyrites, galena, sulphuret of silver, iodurets, and double iodurets, carbonates, malachite, calcareous spar, dolomite, metallic and earthy phosphates and arseniates, crystallized silica, &c. He also discovered a process of electric coloring on gold, silver, and copper, which has been extensively and variously applied in practice. In his electro-chemical investigations, Becquerel's object has been to discover the relations exist-

ing between electric forces and the so-called chemical affinities, and to excite the latter into action, by means of the former. All kinds of plating with gold or silver by the humid process, such as electrotyping, are only so many various applications of electro-chemistry. Among the numerous and important labors of Becquerel, we may name his researches on the electric conductivity of metals; on galvanometers; on the electric properties of tourmaline; on atmospheric electricity; on the effects produced by vegetation; on the electro-magnetic balance, capable of measuring with exactness the intensity of electric currents; on the use of marine salt in agriculture.—His second son, ALEXANDRE EDMOND, discovered a chloride of silver which will receive and retain the colored impressions of light; so that the colors of the rainbow may now be fixed in the daguerreotype, in all varieties of hue; but they can only be retained in obscurity, as they gradually disappear when long exposed to light.

**BEOSKEREK.** I. KIS, or **LITTLE BEOSKEREK**, a Hungarian town, county of Temesvar. The inhabitants are Germans and Wallachians. There is a Roman Catholic church here for the accommodation of the former, and a non-united Greek church for the latter. II. **NAGY**, or **GREAT BEOSKEREK**, a town on the left bank of the Bega, and united by the Bega canal with Temesvar. It contains some district offices, and 2 churches, and enjoys important privileges. Pop. about 12,600.

**BED AND BEDSTEAD.** By bed is generally understood a sack containing something more or less soft to sleep upon, and by bedstead a framework of various materials to raise the bed from the floor or ground. In the earliest times of all nations, the skins of beasts were generally used for beds, and to this day, hides are spread upon the ground or in rude huts, by savages, for their nightly repose. The ancient Britons, when first invaded by the Romans under Julius Cæsar, were still using dried skins or occasionally rushes and heath, but were taught by their conquerors to substitute sacks of straw to sleep upon. The old English expression of a "lady in the straw" comes from the universal use in old times of straw, and means nothing more than a lady in bed, and alludes metaphysically to an ordinary domestic event. The Romans, in the progress of luxury, soon availed themselves of the soft delights of a feather bed, and its use was urged as a charge of effeminacy against the patricians of the imperial city. The classical nations of antiquity, as they took their food in a reclining position, were in the habit of using a dining bed (*lectus tricliniaris* or *discubitorius*). This was 4 or 5 feet in height, and was arranged in 3 portions, along the 3 sides of a square table; the 4th side being left open for the easy access of the attending servants. The feather bed, although long esteemed a luxury, has now yielded generally to the harder hair mattress, for which we are indebted to the French, from whom it

is often called the "French mattress." The hair mattress with an under-layer of steel springs is now considered the perfection of a luxurious couch. Feathers being such bad conductors of caloric, it is found that they do not allow of that free radiation of heat from the animal body, which is essential to its due comfort and health, and accordingly the hair bed is adopted, as being both more wholesome and conducive to repose. There have been various ingenious contrivances for the ease of the sick and the wounded, and medical and surgical beds of different kinds adapted to the peculiar necessities of the sick are accordingly used. The hydrostatic bed, made of India rubber cloth, and filled with water, has been found one of the most useful of them.—The bedstead was originally contrived to raise the bed from the ground, for the sake of cleanliness, and protection from vermin and other nuisances and dangers. It has generally been constructed of wood, and from its early rude structure it advanced with other household furniture to an imposing degree of dignity. The old "four-poster" with its tall columns of carved mahogany or oak, lifting to the ceiling a great canopy of rich stuff, was the cherished pride of ancient housewives, but it is becoming obsolete. The French bedstead, without posts or curtains, is now generally substituted, it being found, from the ease with which it is moved and the free ventilation it allows, more healthful and convenient. It is made generally of wood, but iron has been found of more advantage, particularly in hospitals and hot climates, as a security against dirt and vermin. Surgical ingenuity has contrived various mechanical means for adapting the bedstead to the requirements of the sick and of the medical attendant, and by which the surgical bed can be raised or inclined in parts as may be necessary.—We have an illustration of the value and importance of the bed in olden times, in an item of Shakespeare's will: "Item, I gyve vnto my wief my second best bed w<sup>th</sup> the furniture." These are the very words, which are found underlined in the last testament of the great dramatist, as if the bequest had been a second thought.—The "great bed of Ware," which is so frequently alluded to in English literature, and which is able to accommodate some score of sleepers, is probably the largest bed, being 12 feet square, ever spread. Though old enough to have been mentioned by Shakespeare in the "Twelfth Night"—

Big enough for the bed of Ware in England,  
it is yet shown to the curious in the town from whence it takes its name. The most uncomfortable bed ever known, was probably that of Procrustes. This ancient Greek and robber, was in the habit of lying in wait for travellers, and after having robbed them he put them to bed on an iron couch, to which he adapted each one, cutting off the limbs of those who were too long, and stretching the joints of those who were too short.

**BEDALE**, a market town of Yorkshire, England, 83 miles N. N. W. of York. It has a church, built in the time of Edward VI., and a tower once the scene of an obstinate encounter during an inroad of the Scots. The invaders were finally repulsed by the townspeople. Bedale is noted for its fine breed of horses, and for the perfection with which the surrounding country is cultivated. Pop. 2,892.

**BEDCHAMBER**, **LOREDS OF THE**, personal attendants of the king; in the case of a queen, ladies performing the duties. In the present day they are almost nominal appointments, requiring a weekly attendance at the palace, and accompanied with good salaries. The ancient duties were to sleep in the king's bedroom, and to be always at his command by day or night. These duties were rigorously exacted by the great Louis XIV., and it was the pleasure and honor of the highest nobles in his reign to tender their personal services in the minutest particulars of his daily existence.

**BEDDOES, THOMAS**, an English physician and writer upon medical topics, born at Shiffnal, in Shropshire, April 18, 1760, died at Clifton, Nov. 24, 1808. He was of a Welsh family, and was educated for one of the learned professions. At Oxford he devoted much time to the sciences, particularly to chemistry. He formed a high estimate of the splendid discoveries of Black and Priestley as applied to the treatment of disease, and mastered the new doctrine of pneumatic medicine, to the application of which he afterward gave much attention. Having taken his bachelor's degree in 1781, he went to London to study anatomy, became a pupil of Sheldon, and published a translation of Spallanzani's "Dissertations on Natural History." He removed, in 1784, to Edinburgh, where he published a translation of Bergman's "Essays on Elective Attractions," to which he added many original notes. He was an active member of the scientific societies of Edinburgh, before which he read several papers. In 1786 he visited France, formed an intimacy with Lavoisier and other distinguished chemists, and upon his return to England, was elected to the chemical lectureship at Oxford. His talents and position drew around him many men of learning, among whom were Gilbert and Dr. Darwin; and in 1790 he published a dissertation, in which he claimed for the speculative physician, Mayow, the discovery of the principal facts in pneumatic chemistry. At the commencement of the French revolution, he adopted its principles with the utmost enthusiasm, and the freedom with which he expressed his political speculations making his position at Oxford uncongenial, he resigned his chair in 1792. He retired from Oxford to the house of a friend, and at this time published his observations on demonstrative reasoning, with particular reference to the study of geometry, in which he claimed, in opposition to ontological theories, that mathematical reasoning depends essentially upon experiment, and proceeds only by evidence of the senses. He anticipated

new improvements in medicine, from the science of galvanism, which was now arising in Italy; and in his first medical work, embracing observations on calculus, sea-scurvy, consumption, catarrh, and fever, and conjectures on other objects of physiology and pathology, he showed his tendency to found medical science upon chemistry. The most popular of all his works, and that which best reveals his imagination and taste, as well as judgment, was his "History of Isaac Jenkins," a striking picture of the reformation of a drunkard, of which more than 40,000 copies were rapidly sold. Wishing to test his views by experiment, he was enabled, in 1798, to establish a pneumatic institution at Bristol; and in making his arrangements, he was much assisted by his father-in-law, the versatile Richard Lovell Edgeworth. His assistant was Sir Humphry Davy, then a young man; and the first discoveries of this celebrated chemist were made in the laboratory of this institution. The numerous publications of Dr. Beddoes, at this time, had reference to his favorite theory of the efficacy of the permanently elastic fluids, and of the possibility of curing all diseases by breathing a medicated atmosphere. He was especially sanguine in his expectations from the brilliant discovery, by Davy, of the respirability and intoxicating qualities of nitrous oxide; and he issued treatises in rapid succession till near the time of his death. None of his manifold efforts to found the art of medicine upon philosophical principles were entirely successful; yet his imaginative speculations had great influence in promoting the more cautious inquiries of others.

**BEDDOES, THOMAS LOVELL**, son of the preceding, an English poet and man of science, born at Clifton, near Bristol, in 1802, died at Frankfort-on-the-Main, in 1849. He was nearly related to the authoress Maria Edgeworth, and his family connections recommended him favorably to the world of letters. His first work, the "Bride's Tragedy," was published at London when he was but 20 years of age. The criticisms and sketches by Hazlitt and Charles Lamb had somewhat accustomed the English public to the strong and buoyant grace of the old dramatists, and had thus prepared the way for a young author whose every page showed his alliance by sympathy and genius with Massinger, Decker, Marlowe, and other writers of the affluent Elizabethan days. The "Bride's Tragedy" was received with very general admiration, not unmixed with criticisms of its youthful exuberance and altogether unartistic construction. Professor Wilson uttered the prevalent judgment in saying that English tragedy might expect to revive again in this passionate, thoughtful, and independent author. But Mr. Beddoes sought to possess the stage as well as the closet, and to write dramas instead of dramatic poems, and was vexed that theatrical managers rejected his plays. He inherited from his father an intense fondness for scientific study, especially in the direction of human physiology, and passing over to the continent he became a

sort of amateur anatomist in German universities. He finally accepted a professorship at Zurich, and it was there, while engaged in a dissection, that he received a slight wound in the finger, by the consequences of which his life was prematurely ended. After his death his poetical remains, with notes and a memoir, were published at London (1851), in 2 vols., 12mo. The principal of these were 2 tragedies, entitled "Death's Jest Book" and the "Second Brother," both of which abound in aerial fancies, condensed and passionate eloquence, and profound thoughts, and are among the most extraordinary poetical compositions of the present age. His minor poems, though peculiarly sad and sombre, bear proofs of a rich and energetic, though somewhat fantastic nature.

BEDE, or BEDA, commonly called the venerable Bede, was an English monk, born in Wearmouth, near the mouth of the Tyne, about A. D. 672, died in May, 785. He lived in that most interesting period of the ecclesiastical history of England, just after the triumph of the Roman over the Scottish church, and in the infancy of the Anglo-Saxon church. He was sent to the monastery of St. Peter, under the care of Abbot Benedict, at the age of 7 years, where he remained 12 years, at the expiration of which time he was ordained a deacon. At 30 years of age he took orders as a priest. His fame seems already to have reached the continent, for it is related that Pope Sergius desired Bede might be sent to him, for an assistant in ecclesiastical discipline. Bede, however, declined, being anxious to devote himself to the compilation of the ecclesiastical history of the English nation—a work which he himself tells us he completed when he was 59 years old. He also published several other works, and acquired so great celebrity that many of the most eminent priests, including the archbishop of York, came to consult him in ecclesiastical matters. By his devotion to study and seclusion he laid the foundation of consumption, of which he finally died. It is related of him that he continued, even to the last, to perform the duties of his station, and also to prosecute his favorite task of writing. Especially in the closing days of his life was he anxious to complete two tasks which he had commenced, viz.: the translation of the Gospel of John into Anglo-Saxon, and the compilation of some extracts from St. Isidore. On the last night before his death he continued dictating to his amanuensis, until his increasing weakness attracted the attention of that person, who said to him: "There remains now only one chapter, but it seems difficult for you to speak." "It is easy," said Bede; "take your pen, dip it in the ink, and write as fast as you can." At length, when it was nearly completed, Wilberch, the amanuensis, recalled his attention after an interruption, saying, "Master, there is now but one sentence wanting;" upon which Bede bade him write quickly. When Wilberch said, "Now it is finished," Bede replied, "Thou hast said the truth, *consummatum est*." He immediately de-

sired to be placed where he had been accustomed to pray. This being done, he exclaimed, "Glory be to the Father, and to the Son, and to the Holy Ghost," and peacefully expired. He was interred in the church of his own monastery, at Jarrow, but his remains were subsequently removed to Durham, and placed in the same coffin with those of St. Cuthbert. Bede was a man of extensive and profound erudition for his time. His mind was systematic in its thought, and simple and perspicuous, though not elegant, in its modes of expression. His *Historia Ecclesiastica*, as well as all his other works, was written in Latin. The history was printed in 1474. That edition is rare, there being only two copies known in England. There have been 8 English translations of it. It contains little of the civil and political history of England. Indeed, this neither came within the design nor the taste of Bede. His province was emphatically religious. The term "Venerable" was given to him soon after his death.

BEDEAU, MARIE ALPHONSE, a French general, distinguished in the Algerine wars, and in the events attending and following the revolution of 1848, born at Vertou, near Nantes, Aug. 19, 1804. The son of a naval officer, he was educated in the military schools of La Flèche and St. Cyr, and entered the army as lieutenant in 1825. He made the Belgian campaigns of 1831 and 1832 as aide-de-camp of Gen. Gérard, and at the siege of Antwerp was appointed to confer with the Dutch general Chassé, who was maintaining himself in the citadel. In 1836 he was sent to Algeria as commander of a battalion in the foreign legion, and for the valiant part which he took in storming Constantine, he was made commandant of that city, and was advanced to the rank of first lieutenant. In 1838 he was transferred to the supreme command of Bougliah, and after several engagements with the Berbers or Kabyles, was promoted to a colonelcy in the 17th regiment of light infantry. He displayed remarkable energy in the expedition of Cherchell, where he sustained almost daily conflicts, was twice wounded, and at the pass of Muzais maintained himself for 4 hours with 800 men against a force of 10,000 regular troops and Kabyles, led by Abd el Kader himself. He was made brigadier-general in 1841. Being intrusted by Marshal Bugeaud with the direction of military and political affairs on the borders of Morocco, he defeated Abd el Kader in 8 engagements, and forced him to evacuate the province of Tlemcen, with the civil organization of which he then occupied himself. In the war with Morocco, in 1844, he took an active part in the series of victories which terminated in the battle of Ialy. In 1845 he received the command of the province of Constantine, directed the expedition of Aures, defeated the rebellious tribes, and subjected the province of Oran. In 1847 he was made governor of Algeria. He was in Paris at the outbreak of the revolution of February in the next year, and repaired to the

Tuileries to place himself at the disposal of the king. He was ordered by Bugeaud, who had received the command of the army, to lead a column from the Tuileries to suppress the insurrection on the Boulevards; but the revolutionary movement proving much stronger than had been anticipated, and the national guard itself hesitating, it was with difficulty that he could execute the order, which he subsequently received, to retreat to the palace. After the flight of Louis Philippe, he was appointed to the command of all the troops stationed around the Tuileries, and when the chamber of deputies was threatened by the insurgents, he occupied the passage way and would have been able to bar it, but he received from Barrot, the president of the council of ministers, orders to abstain from using force. Being therefore obliged to let the insurgents pass, the chamber was dissolved. Under the provisional government, he declined the appointment of minister of war, and accepted the command of the army of Paris. During the insurrection of June, 1848, he was severely wounded in one of the first actions. He was elected to the national assembly, of which body he became vice president, and afterward held the same position in the legislative assembly. He was sent in 1849 to assist the army of Gen. Oudinot in pressing the siege of Rome, but learning at Marseilles the success of the French troops, he returned to Paris. Though originally a legitimist, he adopted liberal views, and refusing the oath to Louis Napoleon, retired to Belgium, and has since lived in Brussels.

**BEDEHOUSE** (Saxon, *bed*, a prayer), an ancient term for an almshouse, so called from the poor being supposed to offer up prayers for the good of the founders' or benefactors' souls. The term is still in local use in Scotland.

**BEDELL**, GREGORY T., D.D., an eloquent clergyman of the Protestant Episcopal church, formerly rector of St. Andrew's, Philadelphia. He was born on Staten Island in 1798, graduated at Columbia college in 1811, ordained by Bishop Hobart in 1814, stationed at Hudson, on the North river, in 1815, removed to Fayetteville, N. C., 1818, and finally to Philadelphia, where he died in 1884. His sermons were remarkable for simplicity and point: they were seldom written in full. Thirty of them have been published, with a memoir, by the Rev. Dr. Tyng.

**BEDELL**, WILLIAM, Anglican bishop of Kilmore, in Ireland, born at Black Notley, Essex, in 1570, died at Kilmore Feb. 7, 1642. He was secretary to Sir Henry Wotton, on his embassy to Venice, 1604. Having acquired the Italian language, he translated the "Book of Common Prayer," and presented it to the clergy who were at the time appointed by the republic of Venice to preach against the papal power and pretensions. On his return to England, he remained in great retirement for some time, but was at length presented to a living in Norfolk. In 1627 he was elected provost of Trinity

college, Dublin, which he declined until the king's orders made his acceptance imperative. He was next made bishop of Kilmore and Ardagh. Visiting his see, he found the ecclesiastical property in a ruinous condition, through the malversations and neglect of the officials, and at first he was unable to obtain sufficient income from the see even for his own support. He obtained the restitution of a small part of the lands of the diocese, and finding the charge too onerous for him, he resigned the see of Ardagh, and addressed himself to the task of reforming the clergy, and of introducing the Protestant worship into Ireland. For this latter purpose, he studied Irish, and had the prayer book with the homilies of Chrysostom and Leo in praise of reading the Scriptures translated, and put into the hands of the people. At the breaking out of the great Irish rebellion of that period, Bishop Bedell was at first left in quiet possession of his see and residence; a respite which he used for protecting and maintaining the distressed Protestants. Soon, however, his palace was invaded, and himself, his two sons, and son-in-law, were carried off to a stronghold of the rebels, where all except the bishop himself were put in fetters. The exposure to the weather during the winter, for the place of his confinement was in a ruinous condition, brought on a severe fever, of which soon after his release he died. At his burial a concourse of the opposite creed attended to pay respect to his remains, and after the ceremony a volley was fired over his grave by the rebels.

**BEDESMAN** (Saxon, *bed*, a prayer), was a common suffix to the signature at the end of English letters in the 15th and 16th centuries, and equivalent to petitioner. The Paston letters, 1460-1480, furnish many examples. Sir Thomas More, writing to Cardinal Wolsey, styles himself "Your humble orator and most bounden bedesman." Margaret Bryan, the governess of Princess Elizabeth, signs herself in writing to a superior, "Your daily bede-woman."

**BEDFORD**. I. A county in the south part of Pennsylvania; area about 1,000 square miles. The surface is broken by numerous ridges of the Alleghanies, whose principal chain forms the W. border of the county. One-half of the county is unfit for cultivation, but in this portion iron ore is abundant. In 1850 it yielded 248,302 bushels of wheat, 206,344 of corn, 240,803 of oats, 18,094 tons of hay, and 346,587 pounds of butter. There were 63 mills, 17 factories, 20 tanneries, 52 churches, 8 newspaper offices, and 5,229 pupils attending public schools. It has abundant water power; pop. 23,052. Capital, Bedford. II. A county in the southern part of Virginia, at the eastern base of the Blue Ridge; area, 504 sq. m. Its surface is hilly and mountainous, and the soil fertile. Tobacco, Indian corn, wheat, and live stock are its principal products. In 1850 it yielded 602,362 bushels of corn, 178,990 of wheat, 294,852 of oats, 1,955,486 pounds of tobacco, and 238,233 of butter. There were 40 churches,

and 638 pupils attending public schools. Its real estate was valued in 1850 at \$3,071,563; in 1855 at \$4,849,287, showing an increase of 57 per cent. Capital, Liberty. Pop. in 1850, 24,080; slaves 10,061. III. A central county of Tennessee; area, 550 sq. m. The surface is undulating, and extensively cultivated; the soil is fertile. The county is intersected by Duck river, and by a turnpike and a railroad to Nashville. Productions in 1850, 1,521,867 bushels of Indian corn, 270,182 of oats, 145,492 pounds of butter, and 86,872 of wool. There were 40 churches, 1 newspaper office, and 2,056 pupils attending public schools. Capital, Shelbyville. Pop. 21,512, of whom 16,010 are free, and 5,502 slaves.

BEDFORD, a post borough, capital of Bedford co., Pa., 200 miles W. of Philadelphia, on the Raystown branch of the Juniata river. It is celebrated for its mineral springs, situated in a beautiful valley about  $1\frac{1}{2}$  mile from the town, which are much frequented in the summer season by invalids and fashionable tourists. Pop. 1,203.

BEDFORD, or BEDFORDSHIRE, an inland county of England; area, 297,632 acres; pop. 124,478. Bedford, the shire town, and a parliamentary borough, is situated on the river Ouse, 45 miles from London. It has 4 Gothic parish churches, free and blue-coat schools, a hospital for a master and 10 poor brethren, and 58 almshouses. It has also a famous grammar school, founded in 1556, with 8 exhibitions of £80 a year each, to Oxford, Cambridge, and Dublin, open to the children of all resident householders. All these charities, with £800 distributed yearly in marriage portions, and £500 for decayed householders, are maintained by a bequest of Sir William Harpur, lord mayor of London in 1561. The income for these purposes is about £14,000 per annum. It returns 2 members to the house of commons, and furnishes the title of duke to the Russell family. Pop. 11,693.

BEDFORD, DUKE OF (JOHN PLANTAGENET, or, as Shakespeare calls him, Prince John of Lancaster), third son of King Henry IV., of England, and regent of France for the English, born in 1389, died at Rouen in France, Sept. 18, 1435. He was employed by his father in Scottish wars, distinguished himself as a warrior at the battle of Shrewsbury, received his ducal title under Henry V., and in the war with France was placed at the head of the forces in England, while the king himself fought abroad. Henry V. dying in 1422, and leaving an infant son as his successor, desired Bedford to be regent of France, and to maintain the conquests in that country; and the parliament immediately transcended the royal wish by making Bedford also protector of the kingdom and church of England, except during his absence beyond seas. The duke at once renewed the war against Charles VII., on French soil, after having by the liberation of the young king James of Scotland, made peace

with Scotland, and thus got rid for the time of a thorn in the side of England. He also consolidated his alliance with the wealthy and powerful principality of Burgundy, and with the duke of Brittany. Thus supported, he reduced the king of France to the last extremity by the disastrous battles of Crevant and Verneuil, and the complete conquest of that country by the English seemed impending. The withdrawal of the duke of Burgundy from the alliance did not check the good fortune of Bedford, and the kingdom of France was saved only by the marvellous career of Joan of Arc. The appearance of this maiden at the siege of Orleans forced the English to retreat; yet Bedford quickly gained new successes, broke the spell which had given confidence and enthusiasm to the French armies by repulsing Joan from the walls of Paris, and, in 1430, captured her in a sally from Compiègne. In effecting the tragic death of the peasant girl of Domremy, he was a principal agent. He died before the cause which he had so successfully maintained received any disaster from the opposition of the duke of Burgundy. Like many others of the descendants of John of Gaunt, he was a patron of literature and the arts, and he transferred from Paris to London a library of 900 volumes. A magnificent manuscript missal which he caused to be executed for his wife, was sold in 1833 for £1,100. The ducal dignity of Bedford, after having been extinguished for two centuries, was revived in 1694, and bestowed upon the house of Russell.

BEDFORD LEVEL, a district of England, consisting of an extensive tract of level country bounded N. E. by the German ocean, and on all other sides by highlands which encompass it like a horse-shoe. It embraces the isle of Ely, in Cambridge, and portions of Northampton, Huntingdon, Lincoln, Norfolk, and Suffolk—its length being about 60 miles, its breadth 40 miles, and its area probably about 400,000 acres. There is good reason to suppose that at the time of the Roman invasion the surface of the district was much lower than it is now, and that it was covered by one of those vast forests into which the natives used to retreat, and which it was the general policy of the conquerors to destroy. The subjugated people were employed in felling the trees, and erecting great embankments to keep out the sea. In the 8d century, the emperor Severus built roads through the marshes, one of which, from Peterborough to Denver, was 60 feet wide and made of gravel 3 feet deep. It is now covered by from 3 to 5 feet of soil. For many years the district was fertile and well cultivated, and Henry of Huntingdon, who wrote in the 12th century, describes it as being "very pleasant and agreeable to the eye, watered by many rivers which run through, diversified with many large and small lakes, and adorned with many woods and islands." But in 1236, during a violent storm, the sea burst through the embankment at Wisbeach and other places,

doing immense damage to life and property, and reducing the surviving inhabitants to great distress. A second accident of the same kind occurred in 1253, and a third a few years later. The evil, moreover, was sometimes aggravated by improper measures taken for its cure, so that in the course of time the greater part of the district became a vast morass, some portions of which were covered with pools of stagnant, putrid water from 10 to 20 feet deep. Efforts to drain it were set on foot in the reigns of Henry VII., Elizabeth, and James I., but all failed. In the time of Charles I., the earl of Bedford, after whom the district was named, made a partially successful attempt, which was renewed in 1649, by his son, who brought the work to a close and received 95,000 acres of the reclaimed land as a compensation. A regular system for preserving and improving the drained lands was now inaugurated. A corporation for their management, consisting of a governor, 6 bailiffs, 20 conservators, and a commonalty, was chartered and is still kept up. Of late years important improvements have been made in the old system of drainage, which in some respects proved defective. The reclaimed lands produce fine crops of grain, flax, and cole seed, but the harvests have occasionally suffered by fresh inundations, one of which in 1841 involved a loss of over £150,000.

BEDJA, a district of Nubia, extending along the W. shore of the Red sea, from Suakin to Cape Camol. The Bisharya, a tribe of Bedouins, are almost the only inhabitants.

BEDLAM, a corruption of Bethlehem, the name of a religious foundation which was granted in 1547 by Henry VIII. to the corporation of London, and by them applied to the purpose of a hospital for the insane. The place was originally within the city boundaries, but in 1814, a new building was erected in St. George's fields, on the south side of the Thames, which was called New Bethlehem, or, vulgarly, Bedlam. The patients, who had been discharged partially cured, and went about begging, were called Bedlam beggars, or Tom-o'-Bedlams.

BEDOUINS, BEDAWKEN, men of the desert, the aborigines of Arabia, and descendants of Ishmael. They seem never to have been conquered. A few expeditions against them in different ages of the world have succeeded in chastising them and repressing their too great energy, but their retreat into their native deserts has effectually stayed the progress of the invaders. Mehemet Ali, in his war against the Wahabees, was perhaps their most successful assailant. On their part, they have been marauders over neighboring territories, from the earliest periods of history; and in the 7th century, they were stirred up by the doctrines of Mohammed to a great pitch of excitement. Their innate love of war, and the ardor of a new faith, made them irresistible, and carried them through Asia and to the westernmost point of southern Europe. They are found throughout all northern Africa, on the continental

shore of the Persian gulf, and in the plains of Syria and Mesopotamia. Their essential characteristic is that they are dwellers in tents, live by their flocks and herds, and that their hand is against every man. They are ignorant, fierce, and revengeful, but scrupulous in honor or honesty, and of depraved morals. They are engaged in constant warfare with each other, and are enemies to the stranger and the wayfarer. Their greatest virtue is their hospitality, and even this is very questionable; its inviolability has been greatly exaggerated. Instances certainly are not rare of magnanimous conduct, when the sacred rights of asylum have been observed not only in the letter but in the spirit. Such cases are the themes of ceaseless praise in the songs and narratives of the Bedouins, and the very praise lavished on them is rather a proof of their rarity and of their personal and heroic character.—In personal appearance the Bedawi is under the middle size, spare and wiry, capable of sustaining great fatigue and continued exposure to the fiery sun of his native clime. His clothing is oftentimes reduced to a single garment, a woollen gown bound round his waist with a girdle, in which he carries his weapons and his pipe. The better class wear a head covering, or *haik*, either a handkerchief folded corner-wise or a woollen headpiece, and bound round the top of the head with a cord. The under-garments of linen or cotton and a flowing cloak of the finest and whitest wool, a handsome belt and arms, complete the attire. In complexion they are dark to a brown black. This depends on exposure, for the women are some shades fairer. They practise both polygamy and slavery. Their amusements are story-telling, to which they are passionately devoted, throwing the spear, and other mimic war, smoking, and coffee-drinking. The story-telling and the pipe are an unfailing resource, although some of them, the Somaalis and Wahabees for example, detest tobacco. The general government of the Bedouins is patriarchal; some families are held in particular reverence, and the heads of these families are sheiks. The Marabouts, or holy men, exercise great influence, but this is more of a personal character. The emir, or sultan, is elective. If the son inherits his father's qualifications, he frequently succeeds to his title, and is chosen by the sheiks, who are propitiated by gifts. They live on the milk of their flocks, cultivating sometimes a small crop of barley or other grain, more frequently purchasing food and ammunition in exchange for their live stock. The Bedouins of the desert are distinct from the Arabs of the towns, who carry on commercial undertakings, and live in a peaceable manner. The most decidedly nomadic are the inhabitants of the desert south of Atlas, the Arabian tribes, and those which inhabit the desert of Sinai. The Bedouins of Arabia acknowledge the nominal supremacy of the sultan of Turkey, whose authority is so weak, however, that he is obliged to make an annual present to his loyal subjects, in order to

secure the free transit of the caravan to Mecca, and even this bridge of gold does not always make a way for the caravan, for refractory individuals will sometimes levy black mail. Those within the bounds of Mehemet Ali's vigorous rule, were brought to a sense of his superiority, and their country was perfectly safe in his lifetime. The same can scarcely be said under the government of his weaker successors.

BEDRIAUM, in ancient geography, a small town or village of Cisalpine Gaul, on the high road between Verona and Cremona. Its precise location is uncertain, but it was probably situated not far from where the town of Canneto now stands. It is famous for 2 battles fought in its neighborhood. The 1st was A. D. 69, when the forces of the emperor Otho were completely defeated by those of Vitellius, under Cæcina and Fabius Valens. The 2d was a few months afterward, when the army of Vitellius was beaten near the same place, by the troops of Vespasian, under Antonius Primus. In both instances the attacking army advanced from Bedriacum, but the battle, in each case, actually took place nearer to Cremona than to that village.

BEDSTEAD. See BED.

BEE (*apis mellifica*, Linn.), a social insect of the order *hymenoptera*, family *anthophila* and section *apiaria* of Latreille; this species is probably of Asiatic origin, whence it has spread over Europe and has been imported to America, where it exists in a wild state in great numbers, and far from human habitations. The bee has four membranaceous naked wings, the upper being the larger; the mouth is furnished with 2 strong mandibles and 4 palpi, largest in the working bee, and used not so much in eating as in breaking hard substances in their various labors; the teeth, concave scales with sharp edges, are attached to the ends of the jaws and play horizontally. For taking up liquids it has a long flexible proboscis or trunk, performing the office of a tongue, though it is formed by a prolongation of the under lip; it is solid, and not tubular like the trunks of other hymenopterous insects; the trunk is supported on a pedicel, and is protected by a double sheath; the central portion, which appears like a thread or silky hair, under the microscope is seen to terminate in a sort of button fringed with hairs, and the whole organ to its very base is surrounded with similar fringes, which are admirably adapted for licking up honey or other fluid aliment. The eye is large, composed of a great number of 6-sided facets thickly studded with hairs; there is 1 on each side of the head, and also between the antennæ 3 small bright spots considered by Swammerdam and Réaumur as eyes; from the fact of bees recognizing their hives from long distances, and flying in a straight line toward them with the greatest rapidity, it would seem that the sense of vision is very acute; at the same time we see them running their heads against the hive, and actually feeling their way to the door with their antennæ; so that

their composite eyes are probably fitted only for distant vision. Whether the spots described by Swammerdam are eyes, or not, it seems that the antennæ chiefly guide the bees at night and in the vicinity of near objects. The antennæ are composed of 18 articulations in the males, and of 12 in the females; from their great flexibility and constant motion most of their impressions from without are doubtless received through these; by them every object is examined, many of the operations of the hive performed, as building the comb, storing the honey, feeding the larvæ, and ascertaining the presence and wants of the queen; by them also their mutual impressions are conveyed, as by a mute language—they are exquisite organs of touch, and their removal completely changes the instincts of both workers and queen. The legs are 6 in number; in the hind pair of the workers the middle portion is hollowed into a triangular cavity or basket, surrounded by a margin of thickly set hairs; in this receptacle are carried the pollen, propolis, and other hive materials; at the end of the feet are little hooks by which they adhere to the hive, and to each other during the wax-secreting process; the other pairs of feet have a pencil of hairs on the tarsi by means of which the pollen is collected, and brushed off from their bodies on arrival at the hive. The bee has two stomachs; the first is a large membranous bag, pointed in front, for the reception and retention of the honey; no digestion takes place in this, the analogue of the crop of birds; its walls are muscular and capable of throwing back the honey into the mouth for deposition in the cells or distribution to the working bees; digestion is performed in the second stomach, which is of a lengthened cylindrical shape, communicating with the first stomach, and with the intestine, by a projecting valvular apparatus, with a very small opening, preventing all regurgitation of the food. The muscular strength of bees is very great, and their flight is rapid and capable of being long sustained.

—Notwithstanding the cultivation of the hive-bee from the earliest antiquity, their history was little more than a series of conjectures until the invention of glass hives in 1712, by Maraldi, a mathematician of Nice, enabled naturalists to study the indoor proceedings of the bee; this invention was taken advantage of by Réaumur, who laid the foundation of the more recent discoveries of Hunter, Schirach, and the Hubers. A hive of bees consists of three kinds: females, males, and workers; the females are called queens, not more than one of which can live in the same hive, the presence of one being necessary for its establishment and maintenance; the males are called drones, and may exist in hundreds and even thousands in a hive; the workers, or neuters, as they have been called from the supposition that they belonged to neither sex, are by far the most numerous. The queen lays the eggs from which the race is perpetuated; the males do no work, and are of no use except to impregnate the females, after

which they soon die or are killed; the workers collect the honey, secrete the wax, build the cells, and feed and protect the young. The females and workers have a sting at the end of the abdomen, which is absent in the males; this formidable weapon consists of an extensile sheath, enclosing two needle-shaped darts of exceeding fineness, placed side by side; toward the end they are armed with minute teeth, like those of a saw, whence it happens that the animal is frequently unable to withdraw the sting from an enemy that it has pierced, causing its own as well as its victim's death; the sting is protruded by several muscles so powerful that it will penetrate  $\frac{1}{2}$  of an inch into the thick skin of the human hand. When the sting enters the flesh, the acrid poison is squeezed into the wound from a bag near its base; the poison is a transparent fluid, with a sweetish and afterward acrid taste, and an acid reaction; it is of so active a character that a single sting almost instantly kills a bee; animals have been killed and men nearly so by the stings of an enraged colony whose hive had been upset. The queens are more peaceable and less disposed to sting than the workers. These three kinds of bees are of a different size and may be easily recognized; the males are of the heaviest flight. The queen bee is the largest, being  $8\frac{1}{4}$  lines in length, the males being 7, and the workers 6; her abdomen is longer in proportion, and has 2 ovaria of considerable size; her wings are so short as hardly to reach beyond the third ring, and her color is of a deeper yellow. She is easily recognized by the slowness of her march, by her size, and by the respect and attentions paid to her; she lives in the interior of the hive, and seldom departs from it unless for the purpose of being impregnated or to lead out a new swarm; if she be removed from the hive, the whole swarm will follow her. The queen governs the whole colony, and is in fact its mother, she being the only breeder out of 20,000 or 30,000 bees; on this account she is loved, respected, and obeyed, with all the external marks of affection and devotion which human subjects could give to a beloved monarch. The impregnation of the queen bee was long a subject of uncertainty; it is now known that this never takes place within the hive, and that if she be confined she always remains sterile, even though surrounded by males. To accomplish it the queen leaves the hive and flies high into the air; after an absence of about half an hour she returns with the most unequivocal evidence of sexual union, having robbed the male of the organs concerned in the operation; the drone, thus mutilated, soon dies—this has been repeatedly observed; from this fact Huber infers the necessity of a great number of males being attached to a hive in order that the female may be almost certain to meet one in her flight; the warmest part of a sunny day is usually selected by the female for this excursion. When impregnation occurs late in the autumn the laying of the eggs is delayed by the cold weather until

the following spring, so that the ova are ready to come forth in March; but the young queen is capable of laying eggs 36 hours after impregnation. Before depositing an egg she examines whether the cell is prepared to receive it and adapted for the future condition of the grub, for queens, males, and workers have cells specially constructed for them; the eggs producing workers are deposited in 6-sided horizontal cells; the cells of the drones are somewhat irregular in their form, and those of the queens are large, circular, and hang perpendicularly. When the cells are ready, the queen goes from one to the other, with scarcely any repose, laying about 200 eggs daily; the eggs first laid are those of workers, for 10 or 12 days, during which the larger cells are in process of construction; in these, after acquiring a very large size, she lays male eggs for 16 to 24 days, less numerous than those of the workers in the proportion of about 1 to 30. The royal cells, if from the productiveness of the season and the number in the hive it is determined to bring out another queen, are now commenced; these are of large size, an inch deep and  $\frac{1}{2}$  of an inch wide; during their construction the queen lays the eggs of workers, and, when they are finished, she deposits a single egg in each at 1 or 2 days' interval, worker eggs being laid in this interval. When the eggs are laid the workers supply the cells with the pollen of flowers for the food of the larvæ; the pollen is mixed with honey and water, and partly digested in the stomach of the nursing bees, and distributed of different qualities according to the age of the young. The eggs are of a bluish white color, of a lengthened oval shape, slightly curved; in a proper temperature they are hatched in 3 days; the larvæ are small white worms without feet. The workers remain 5 days in this state, the males  $6\frac{1}{2}$ , and the females 5; at the end of this time the mouth of the cell is closed by a mixture of wax and propolis, and the larvæ begin to spin a silken envelope, or cocoon, which is completed in 36 hours; in 3 days more the larva changes into a pupa or chrysalis, and on the 20th day it emerges from its prison a perfect worker; the males come forth on the 24th day. The color of the bee just out of its cell is a light gray; it requires 2 days to acquire strength for flying, during which it is caressed and plentifully fed by the nurses. The same cell may bring several workers to maturity; when the insect comes out the cell is cleaned, the web being left to strengthen the sides; the royal cells are never used but once, being destroyed when the queen escapes. The eggs and larvæ of the royal family do not differ in appearance from those of the workers; but the young are more carefully nursed, and fed to repletion with a more stimulating kind of food, which causes them to grow so rapidly that in 5 days the larva is prepared to spin its web, and on the 16th day becomes a perfect queen. But, as only one queen can reign in the hive, the young ones are kept close prisoners, and carefully guarded against the at-

tacks of the queen-mother, as long as there is any prospect of her leading another swarm from the hive; if a new swarm is not to be sent off, the workers allow the approach of the old queen to the royal cells, and she immediately commences the destruction of the royal brood by stinging them, one after the other, while they remain in the cells. Huber observes that the cocoons of the royal larvæ are open behind, and he believes this to be a provision of nature to enable the queen to destroy the young, which, in the ordinary cocoon, would be safe against her sting. When the old queen departs with a swarm, a young one is liberated, who immediately seeks the destruction of her sisters, but is prevented by the guards; if she departs with another swarm, a second queen is liberated, and so on, until further swarming is impossible from the diminution of the numbers or the coldness of the weather; then the reigning queen is allowed to kill all her sisters. If two queens should happen to come out at the same time, they instantly commence a mortal combat, and the survivor is recognized as the sovereign; the other bees favor the battle, form a ring, and excite the combatants, exactly as in a human prize-fight. The male bee, or drone, may be known by the thicker body, more flattened shape, round head, more obtuse abdomen containing the male generative organs, the absence of the sting, and the humming noise of their flight; they produce neither wax nor honey, being idle spectators of the labors of the workers, who support them; they comprise about  $\frac{1}{3}$  or  $\frac{1}{4}$  of the whole number of a hive in the spring, when they are most numerous; their use is only to impregnate the females, and, secondarily, to supply food to the swallows and carnivorous insects which prey upon them when they take their mid-day flights. When the queens are impregnated, and the swarming has ceased, the workers, in July or August, commence an indiscriminate attack upon the drones, chasing them into the bottom and corners of the hive, killing them with their stings, and casting out the dead bodies; this destruction extends even to the eggs and larvæ of males. If a hive is without a queen, the males are allowed to survive the winter. The working bees, or neuters, are the smallest, with a lengthened proboscis, the basket conformation of the posterior pair of legs, and the apparent absence of generative organs; rudiments of ovaries have recently been discovered on minute dissection, which explain some remarkable facts in the economy of the hive. The workers have been divided by Huber into nurses and wax-workers; the former are the smallest and weakest, ill adapted for carrying burdens, whose business it is to collect the honey, feed and take care of the grubs, complete the cells commenced by the others, and to keep the hive clean; the latter take the charge of provisioning the hive, collecting honey, secreting and preparing wax, constructing the cells, defending the hive from attack, attending to the wants of

the queen, and carrying on all the hostilities of the community. The number of the workers is from 5,000 or 10,000 to 50,000, according to the size of the hive; they form about  $\frac{2}{3}$  of the whole; they are armed with a sting, and are easily excited to use it. They are sometimes called neuters, as if they were of neither sex; it is now established that the larvæ of the workers and of the females do not differ; that the queens lay only two kinds of eggs, one destined to produce the males, and the other capable of being converted, according to circumstances, into workers or queens; in other words, that the workers are females, in which the generative organs are not developed. Experiments amply prove that on the loss of the queen the hive is thrown into the greatest confusion; the inquietude which commences in one part is speedily communicated to the whole; the bees rush from the hive, and seek the queen in all directions; after some hours all becomes quiet again, and the labors are resumed. If there be no eggs nor brood in the combs, the bees seem to lose their faculties; they cease to labor and to collect food, and the whole community soon dies. But, if there be brood in the combs, the labors continue as follows: having selected a grub, not more than 3 days old, the workers sacrifice 3 contiguous cells that the cell of the grub may be made into a royal cell; they supply it with the peculiar stimulating jelly reserved for the queens, and at the end of the usual 16 days the larva of a worker is metamorphosed into a queen. This fact, which rests on indisputable authority, is certainly a most remarkable natural provision for the preservation of the lives of the colony. While a hive remains without a queen swarming can never take place, however crowded it may be. The possibility of changing the worker into a queen is taken advantage of in the formation of artificial swarms, by which the amount of honey may be indefinitely increased. In a well-proportioned hive, containing 20,000 bees, there would be 19,499 workers, 500 males, and 1 queen.—The food of bees consists principally of two kinds—the honeyed fluids and the pollen of flowers; they also eat honey-dew, treacle, sirup, and any saccharine substance. They lick up honey and fluid substances by their long proboscis from the blossoms of various flowers; the mignonette and clover afford honey of remarkable fragrance and in great abundance. It is inferred that bees have an imperfect sense of taste and smell from their collecting honey indiscriminately from sweet-scented and offensive flowers; it is well known that in some places their honey acquires poisonous qualities from the flowers of different species of laurel, thorn-apple, azalea, and poison-ash; many mysterious cases of sickness have been traced to the consumption of such poisoned honey, and even the bees are sometimes destroyed by the vegetable poisons which they imbibe. During the spring, and until late in the autumn, bees collect the pollen from the anthers of

flowers by means of the hairs on their legs, and, after forming a ball, transport it in their basket to the hive for the food of the young brood; this pollen consists of small capsules which contain the fecundating principle of flowers, and is so abundant that the bees of a single hive will often bring in a pound daily; hence some agriculturists have supposed that the bees diminished the fecundity of plants, by abstracting the pollen, when, on the contrary, they essentially promote it, by transporting the fecundating principle from plant to plant. Insects are among nature's most efficient instruments for the spread of vegetation; by them are produced the greater part of the hybrid varieties of flowers. Honey-dew is a saccharine fluid discharged from the tubes at the extremity of the body in the *aphides*, or plant-lice; these herd together on plants, and become so gorged with sap that they are obliged to eject the honeyed fluid; this falls on the leaves and dries, forming honey-dew, eagerly sought after by bees and ants; the same name has been given to a sweet exudation of the sap from the leaves of plants in dry weather. Bees require considerable water, but they are not particular about its purity; indeed, the more stagnant and putrid it is the better they seem to like it; it is well known that they are very fond of congregating about public urinals, as if the pungent ammoniacal salts were grateful to them. The food of the queen bee has been subjected to chemical analysis by Dr. Wetherill, of Philadelphia; that of the royal grubs is a kind of aesculent jelly, thick and whitish, becoming more transparent and saccharine as the larva increases in size; it has been shown by Huber to consist of a mixture of honey and pollen, modified by the workers; the former appears amorphous under the microscope, is heavier than water, of the consistency of wax, sticky and elastic; it consists of wax, albumen, and protein compounds, and is therefore properly called bee-bread; it contains albuminous compounds, which would probably prove, on analysis, similar to the gluten of wheat. Honey alone is not sufficient for the support of bees; they require nitrogenized substances, like pollen, for the body, as well as honey and non-nitrogenized food. Wax is secreted in pouches or receptacles, in the abdomen of the working bees only, lined with a membrane arranged in folds like a 6-sided network; it accumulates in these until it appears externally in the form of scales between the abdominal rings; these plates are withdrawn by the bee itself, or some of its fellow-workers, and used for building and repairing the cells. The formation of wax is the office of the wax-workers, which may be known from the nurses by the greater size and more cylindrical shape of the abdomen, and larger stomach; the secretion goes on best when the bees are at rest, and accordingly the wax-workers suspend themselves in the interior in an extended cluster or hanging curtain, holding on to each other by the legs; they remain

motionless in this position about 15 hours, when a single bee detaches itself, and commences the construction of a cell, and the others come to its assistance and begin new cells. The quantity of wax secreted depends not at all on the pollen consumed, but on the consumption of honey; when bees are fed on cane sugar they form wax with more difficulty than when they are fed on grapesugar; the former is not so readily decomposed, but may be changed into the latter in the bee's body by the absorption of 2 equivalents of water. According to Liebig, an equivalent of starch is changed into fat by losing 1 equivalent of carbonic acid and 7 equivalents of oxygen; and Dr. Wetherill suggests that wax, which bears a great analogy to fats, may be derived from honey in a similar manner. Wax, composed of cerine and myricine, is represented chemically by  $C_{44}H_{88}O_{16}$ , and anhydrous grape sugar by  $C_{12}H_{22}O_{11}$ ; so that 8 equivalents of grape sugar would yield 1 equivalent of wax by the loss of 2 equivalents of carbonic acid, 2 of water, and 28 of oxygen.—Bees breathe by means of air-tubes, which open externally on the coraelet; experiments show that they soon perish in a vacuum or under water, and that a constant renewal of atmospheric air is necessary for their well-being. The condition of a hive, filled with many thousand active and crowded bees, and communicating with the outer air only by a small opening at the bottom, and that usually obstructed by the throng passing in and out, is very unfavorable for the maintenance of a pure air; the black hole of Calcutta is the only human receptacle which can be compared to it; a taper is very soon extinguished in a globe of the dimensions and with the aperture of a bee-hive, and yet these insects, as easily suffocated as any other, get along very well, and their respiration is accompanied by the usual absorption of oxygen and excretion of carbonic acid gas. With all this closeness of the air in the hive, direct examination has proved that it is nearly as pure as atmospheric air; neither the contents of the hive, nor the bees themselves, have any power of evolving oxygen, but the air is renewed through the door of the hive, where an inward current is produced, whenever required, by the rapid agitation of the wings of the bees. Some of the workers are always thus employed in ventilating the hive, which they do by planting themselves near the entrance, both inside and outside, and imitating the action of flying; in this way the impulse which would carry them forward in flight is exerted on the air, producing a powerful backward current; in this manner is explained the humming sound heard in the interior of an active hive, especially in the warmest days. From their active respiration the temperature of a hive is very high, varying from  $78^{\circ}$  to  $84^{\circ}$  F., and on some occasions rising to  $106^{\circ}$ ; they are very sensitive to thermometrical changes, the warm sun exciting them to vigorous action, and cold reducing

them to a torpid state.—The instincts, and, in the belief of many, the intelligence of the bee, are remarkably displayed in the preparation of the hive, the construction of the cells, and in the phenomena of swarming. The first thing done on entering a new hive is to clean it thoroughly, to stop all crevices, and lay the foundation for the comb. Wax is not the only material used by bees in their architecture; beside this, they employ a reddish-brown, odoriferous, glutinous resin, more tenacious and extensible than wax, called *propolis*, which they obtain from the buds of the poplar and birch and from various resinous trees. This adheres so strongly to the legs of the bee, that its fellow-laborers are obliged to remove it, which they do with their jaws, applying it immediately to every crevice and projection in the hive, to the interior of the cells, and to the covering of any foreign body too heavy for them to remove; in this way even large snails are hermetically sealed and prevented from imparting a noxious quality to the air. Bees will carry home many artificially prepared glutinous substances in their tarsal baskets. After the workers have secreted a sufficient amount of wax, the construction of the combs commences. These are formed into parallel and vertical layers, each about an inch thick, the distances between the surfaces of each being about half an inch for the passage of the bees. They may extend the whole breadth and height of the hive, consisting of thin partitions, enclosing 6-sided cells, about half an inch deep and a quarter of an inch in diameter. The bottom of each cell has the shape of a flattened pyramid with 8 rhombic sides, like the diamonds on playing cards; this gives the greatest strength and greatest capacity with the least expenditure of material. Maraldi had determined that the 2 angles of the rhomb should be  $109^{\circ} 28'$  and  $70^{\circ} 32'$  by mathematical calculation, and that by actual measurement they are  $110^{\circ}$  and  $70^{\circ}$ . There is nothing in the shape of the antennae, mandibles, or legs of the bee, which should determine these angles in the cells. The foundation is a solid plate of wax, of a semicircular form, in which a vertical groove is scooped out of the size of a cell, which is strengthened by further additions of wax; on the opposite side two other grooves are formed, one on each side of the plane opposite the first; after the bottom is formed, the walls are raised round the sides. The cells of the first row, by which the comb is attached to the roof of the hive, have 5 sides instead of 6, the roof forming one. The first cell determines the position of all that succeed it; and 2 are not, in ordinary circumstances, begun in different parts of the hive at the same time. The laborers follow each other in quick succession, each one adding a little to the work; when a few rows have been constructed in the central comb, two other foundation walls are begun, one on each side of it, at the distance of  $\frac{1}{2}$  of an inch, and parallel to it, and then two others as the former are ad-

vanced; the comb is thus enlarged and lengthened, the middle being always the most prominent. If all their foundations were laid at the same time, it would be difficult for them to preserve their parallelism, which is perfect only at the last stage of the building process. Beside the vacancies between the cells, which form the highways of the hive, the combs are pierced with holes, to permit easy communication, and prevent loss of time in going round. The symmetry of the architecture of bees is more observable in their work looked at as a whole, than in its details, as they often build irregularly to adapt the structure to different localities and various unfavorable circumstances; different sized cells are made for the larvae of workers, males, and queens; those for honey and pollen magazines are twice as large as ordinary cells, and so placed that their mouths are upward, for the easier retention of their contents. These supposed defects are generally the results of calculation, and, when mistakes, are very soon remedied. The cells at first are whitish, soft, and translucent; but they soon become yellow and firmer, and quite dark in an old comb.—When a hive becomes too crowded, or for other reasons as yet not perfectly understood, preparations are made for the emigration of a swarm with a queen; scouts are sent out in advance to select a proper place for the new hive, and the workers are busy in collecting an extra quantity of provisions to be carried with them. When the weather is warm, and after a full stock of eggs has been laid, the old queen, unsuccessful in her attempts to destroy the royal brood, abdicates the throne which the first-born new queen will soon dispute with her. During the preparations, a great buzzing is occasionally heard, which suddenly ceases on the day of departure. When all is ready, the signal is given by the workers, and the queen, with all the departing swarm, rushes to the door, and rises into the air; they follow the queen, alighting with her in a dense cluster, and returning, if she does, to the hive. Cold weather, or even a passing cloud, will arrest the emigration until a warmer or brighter period. After a rest at their first landing-place, the swarm collects into a close phalanx, and flies in a direct line to the selected spot. The deserted hive is busily occupied in hatching out a new queen, which, in her turn, leads out a swarm; two or three will be sent off in a summer from an old hive. After the massacre of the males in July or August, the workers busy themselves in collecting stores for winter use; as the autumn advances, honey becomes scarce, and they are obliged to collect the sweet exudations from leaves, honey-dew, and also the juices of peaches and other sweet fruits, after the skin has been broken by birds, snails, and other insects; when all other resources fail, they do not scruple to attack weaker hives, and despoil them of their honey. The cold of winter reduces them to a torpid state, in which they remain until the warm days of spring. Bees recognize the per-

son of their queen; if a new one be given them, they will generally surround her, and suffocate or starve her to death, for it is very remarkable that the workers never attack a queen with their stings; if she be permitted to live 24 hours, she will be received as their sovereign. If a supernumerary queen be introduced, a ring is formed by the workers, and the two queens engage in mortal combat, the survivor having the right to reign. Huber discovered that if the fecundation of the queen be delayed beyond the 21st day of her life, she begins to lay the eggs of males, and produces no others during her life; she lays them indiscriminately in large and small, and even in royal cells; in the latter case, they are treated by the nurses as if they were royal grubs. Reim made the singular discovery of prolific workers, thus explaining the laying of eggs in hives destitute of a queen; but the eggs thus produced are always those of males; this is accounted for by their having passed their grub state in cells contiguous to the royal ones, and from having their generative organs partially developed by devouring portions of the stimulating royal food; how they become impregnated has not been ascertained.—The natural enemies of bees are numerous; among them may be mentioned wasps, hornets, spiders, dragon-flies, toads, lizards, woodpeckers, the bee-eater, and most insectivorous birds, rats and mice, ant-eaters, bears, and badgers. They seldom die a natural death; and the average duration of life cannot be more than a year; the whole population would be destroyed by their enemies, each other, and the severity of the weather, were it not for the surprising fecundity of the queen, who will lay, in temperate climates, as many as 60,000 eggs, and in warm regions, 3 times that number; a single impregnation is sufficient to fecundate all the eggs which a queen will lay for at least 2 years, and probably during her life. The most destructive and insidious enemy of the bee is a lepidopterous insect, of the group *crambida*, the *galleria cerana*, Fab., commonly called the bee or wax-moth; in its perfect state it is a winged moth, about  $\frac{1}{2}$  of an inch long, with an expanse of wings of a little more than an inch; the females are the largest, of a dark gray color, tinged with purple-brown and dark spots; they remain quiet in the daytime, but in the evening, when the bees are at rest, they creep in at the door of the hive and deposit their eggs; when they are prevented from entering, they lay their eggs outside, from which the worm-like caterpillars hatched from them can easily creep in. These small and tender worms eat their way in all directions through the waxen cells; each one spins a tough silken tube, in which it lies concealed by day, and from which it comes out at night, devouring the wax within its reach; they grow to the size of an inch or more, gnawing the combs to pieces, and filling the hive with their dirty webs, until the bees, discouraged by the ravages of their unseen enemies, are obliged to aban-

don their hive with its brood and honey. The only way to secure a hive from these depredators is to destroy the worms and chrysalids at least once a week; the moths may be caught in a mixture of sweetened water and vinegar; the best constructed hives will not supersede the necessity of this constant watchfulness. Bees are subject to a fatal disease, which has been called dysentery, and which appears to be contagious; nothing can be done for it, except by cleanliness and ventilation, and by supplying them with wax. In Wells's "Explorations in Honduras" (New York, 1857), it is stated that there are in Olancho 14 distinct species of honey-bee; these are of small size and mostly stingless. The wild swarms generally establish themselves in the hollow limbs of trees; these are removed to the porches of the houses, and are there suspended by thongs; in this primitive way large amounts of honey and wax are obtained in Central America. The honey is said to be contained in little bags 2 inches long, ranged along the hive in rows, the cells for the young occupying the centre.—The *Humble-Bee* (*bombus terrestris*, Latr.) has been sometimes confounded with the male honey-bee in name, though they do not resemble each other. The humble-bees live in societies less numerous than those of the honey-bee, which end in the autumn to recommence in the spring; they make a loud humming noise during flight, whence the Latin *bombus*, the French *bourdon*, and the English bumble-bee. They live in subterranean habitations, 50 or 60, and sometimes 800 together; the females are the largest, the males the smallest, and the workers intermediate in size. All perish in the winter, with the exception of a few females, which become the founders of a new colony in the spring; these females are 6 times as large as the workers, and may be seen in early spring prying into every hole and crevice in the earth in search of a suitable place for their nest. This they make at a depth of 1 or 2 feet in the meadows and plains; they make cavities of considerable extent, dome-shaped, more wide than high; the vault is made of earth and moss, and the interior is lined with an inferior kind of wax; the entrance may be either a simple aperture at the lower part, or a tortuous moss-covered path; the bottom is carpeted with leaves on which are placed irregular masses of brown wax, the future cells of the young. The larvae live in society until they are about to change into nymphs, when each spins a silken cocoon in which the occupant is placed head downward, and from which it comes out in 4 or 5 days during May and June. The females assist in building the cells, and deposit at the first laying eggs both of males and females; but the latter, on coming to maturity, are only one-sixth of the size of their mother, and lay only the eggs of males. Several females may live in peace under the same roof; impregnation takes place outside the nest. The honey and wax are of the same origin and nature as those of

the honey-bee. As they do not hibernate, but perish during the winter, the same nest is not occupied for 2 successive years.—The nest of the **CARDER-BEE** (*bombus muscorum*, Latr.) is composed of a dome of moss or withered grass placed over a shallow excavation in the ground of about half a foot in diameter; the materials, after being carded by means of the mandibles and fore-legs, are pushed by the first bee backward to a second, which passes it to a third, and so until the nest is reached; they work in long files, the head being turned away from the nest, and toward the material. Their domes are often seen rising 4 or 6 inches above the level of the fields and meadows; the entrance is at the bottom, about a foot long and  $\frac{1}{2}$  an inch wide. As in the humble-bees' nest, we find in that of the carder-bee, little of the architectural regularity of the hive of the honey-bee; there are only a few egg-shaped, dark-colored, irregularly disposed cells, arranged generally in a horizontal position, connected by shapeless waxen columns; these cells are not made by the old bees, but by the grubs, who spin them when they are ready to undergo the change into nymphs; from them they are liberated by the gnawing of the old ones; the cocoons are afterward used as store-houses for honey. The true breeding cells are contained in masses of brown wax, the number of eggs varying from 8 to 80, the whole colony seldom exceeding 60; there are 8 sizes, the females being the largest, none of which are exempt from labor; the females, of which several live in one nest, alone survive the winter. The carder-bee is smaller than the humble-bee, but shorter and thicker than the honey-bee; it resembles in color the materials of the nest, having the fore part of the back a dull orange, and the hind part with different shades of grayish yellow rings.—The **LAPIDARY-BEE** (*bombus lapidarius*, Latr.), of a general black color with a reddish orange tail, builds its nest in a heap of stones, of bits of moss, neatly arranged in an oval form; they are social in their habits, and collect honey with great industry; the individuals of a nest are more numerous than the carders, and much more vindictive. The solitary bees display as much foresight, ingenuity, and skill in the construction of their nests, as do the social genera; and perhaps in a more remarkable manner, as a single individual begins and finishes every part of the work. There are only two kinds of individuals, males and females; the males are idle, and the females perform all the labor of making the nest and providing food for the young; they have no brush to their hinder feet and no basket structure on the external side of the tarsi.—Different species of *megachila*, *anthophora*, and *osmia*, have been called by Réaumur **MASON-BEES**, from their constructing their nests with sand, earthy substances, and sometimes wood, stuck together by clay rendered plastic by their saliva; they build in the interstices of brick walls, in crevices in stones, and wherever they can find a

suitable place, often amid the busiest throngs of men. Within a wall of clay, they make from 1 to 6 chambers, each containing a mass of pollen with an egg; the cells are sometimes parallel and perpendicular, at others with various inclinations, and are closed with a paste of earth; they are thimble-shaped, and about an inch long. Many species, not larger than a horse-fly (*andrena*), have been called mining-bees, from their digging in the ground tubular galleries, a little wider than the diameter of their bodies; they are fond of clay-banks, in which their holes, of the size of the stem of a tobacco pipe, are frequently seen; they are 6 or 8 inches deep, smooth, and circular, with a thimble-shaped horizontal chamber, almost at right angles to the entrance, and nearly twice as wide; in this is placed a single grub with its supply of pollen.—There are several British species of solitary bees to which Réaumur has given the name of **CARPENTER-BEES**, from their working in wood as the mason-bees do in earth; they select posts and the wood-work of houses which have become soft from commencing decay. The violet-colored species (*xylocopa violacea*, Linn.) makes her nest by gnawing out small pieces of the wood, which she carries to a short distance and drops for future use, returning by a circuitous route as if to conceal its location; the direction of the tunnel is oblique for about an inch, and then perpendicular, in the axis of the wood, for 12 or 15 inches, and  $\frac{1}{2}$  an inch in breadth; sometimes 8 or 4 such excavations are made. The tunnel is divided into cells somewhat less than an inch deep, separated from each other by partitions made of the chips and dust cemented together; some other species employ clay for these partitions. At the bottom of the cell is placed an egg, and over it a paste of pollen and honey; in this way are completed 10 or 12 cells, one above the other, and then the principal entrance is closed by a similar sawdust covering. As several weeks are occupied in these labors, and as she is depositing her eggs at considerable intervals, it is evident that the first egg would have become a perfect insect before the last egg had left the grub state; in order to enable the young to escape as they are hatched, each cell has a lateral opening.—Among the leaf-cutting and upholstering bees, may be mentioned the poppy-bee (*osmia popaveris*, Latr.), a European species,  $\frac{1}{2}$  of an inch long, of a black color, with reddish gray hairs on the head and back, and the abdomen gray and silky; she excavates a perpendicular hole in the ground, largest at the bottom, which she lines with the petals of the scarlet poppy cut into oval pieces, and adapted with the greatest nicety and smoothness; the hole is about 8 inches deep, and the lining extends externally on the surface; filling it with pollen and honey to the depth of  $\frac{1}{2}$  an inch, she deposits an egg, folds down the scarlet tapestry, and fills above it with earth; it is rare to find more than one cell in an excavation. The rose-leaf cutter

(*megachile centuncularis*, Latr.) makes a cylindrical hole in the hard earth of a beaten path, from 6 to 10 inches deep, in which she constructs several cells about an inch deep, thimble-shaped, and made with circular pieces of leaves neatly cut out and folded together; the rose-leaf is preferred, but almost any leaf with a serrated margin, as the birch and mountain-ash, will be taken; no cement is employed, the elastic property of the leaves keeping them in place; it takes 9 to 12 pieces to make a single cell, which, when completed with its contents of pollen and honey, and single egg, is closed with 8 pieces of leaf exactly circular; the convex extremity of one cell fits into the open end of the next, by this means greatly increasing the strength of the fabric.

**BEE-EATER** (*merops*, Linn.). The bee-eaters belong to the genus *merops* and family *meropidae*. There are 26 species described, inhabiting most parts of the old world, and migrating from place to place, according to change of season. In the winter they seek the warmest portions of the globe, and the temperate regions in summer, in search of food, which consists exclusively of insects. They commonly perch singly, or in small parties, on a prominent branch, from which they can see all around them. From this they capture insects on the wing, like the swallow, generally returning to the same perch. At morning and evening they often congregate in considerable numbers. Their flight is graceful and sustained; their cry is loud, consisting of pleasant, whistling notes, continued at morning and evening. They rear their young in horizontal holes in the sandy banks of rivers, or in soft rocks which they can excavate. The entrance is small, opening, at the depth of 3 or 4 feet, into a cavity in which the parent can easily turn. The eggs are from 5 to 7 in number, laid on the bare ground, or on moss or other soft material. The common bee-eater (*merops apiaster*, Linn.) inhabits the south of Europe, especially about the Russian rivers Don and Volga, and the northern parts of Africa. It is occasionally seen in England and Sweden. The other species of the genus are found in Africa, Asia, and the Indian archipelago. The common species is about 10 inches long; the bill,  $1\frac{1}{4}$  inch, black and pointed; eyes, red; forehead, bluish green, and behind it green; top of the head, chestnut, with a green tinge; hind head and upper part of neck, chestnut, paler toward the back; from the bill is a black stripe, passing through the eye; the back and scapulars, pale yellow, tinged with chestnut and green; rump and upper tail coverts, blue-green, with a yellowish tinge; throat, yellow; under parts, blue-green, palest on the belly; lesser wing coverts, dull green; quills, mostly sea-green without, and many of the inner rufous—the first very short, the second the largest of all; the tail, wedge-shaped, of 12 feathers, the shafts brown above and whitish beneath—the 2 middle ones sea-green, shaded with rufous—and the longest by nearly an inch; claws,

black. In Egypt this species is eaten as food. The eggs are white. It receives its name from the insect which is its favorite food, though it feeds on most of the winged insects, which it takes as it flies.

**BEE-KEEPING.** The selection of a suitable place for an apiary is of great importance. The situation should be well sheltered from strong winds, either naturally or by building walls or fences. If not sufficiently protected, the bees are prevented from leaving the hive, and when returning with heavy loads of honey and pollen are blown to the ground, or dashed against trees and rocks, and thus many are lost. It is not well to have large surfaces of water very near, lest the bees, overcome by cold or fatigue, should be forced to alight on them, or be carried down by the winds and perish. The hives should especially be protected from north-west winds and from chilling south winds. It is necessary where the winters are severe particularly to regard protection from cold. The hives may face the south or east, or south-east, and thus the greatest benefit will be derived from the continuance of the heat and light of the sun during that portion of the day when they are most useful. The hives should be placed in a right line; it is better to place them on shelves, one above another, than in near rows upon the ground. The distance between the hives should not be less than 2 feet; their height from the ground should be about the same. Some experienced bee-keepers, however, raise the platform of the hive not more than 2 inches from the earth, considering this preferable, because fewer of the fatigued or chilled bees that miss the hive in returning and alight under it, are lost, the flight of issuing swarms is lower, and there is less exposure to strong winds. It will be found of not a little consequence to have the apiary where it can be conveniently watched in swarming time, but it should by all means be removed from all annoyance and disturbance by men or teams passing and repassing, or animals laboring or grazing too near the hives. Grounds on which there are no large trees, but some of small size and shrubbery, on which the swarms may alight, are preferable. The grass should be mowed frequently around the hives, and the ground kept clean, not only for the delight of the bees, but to prevent too much dampness, and to destroy the lurking places of noxious insects and vermin.—The proper construction of the hive is one of the things most essential to success in bee-keeping. Many different kinds have been invented, each more or less complex, designed to gain certain advantages, and to obviate certain evils in managing bees and producing honey. Of these it will be sufficient to mention several of the most important varieties. The chamber hive is made with two apartments—the lower for the residence of the bees, the upper to hold the boxes in which the bees put their honey after having filled the lower part. The advantages of this are claimed to be, a per-

manent cover for the boxes of glass or wood, or vessels of any kind put on the hive; a better protection from the weather, with less inconvenience in turning up the hive and in fitting a shelter over it, than is found with a movable cover. These hives are sometimes made wedge-shaped, being several inches narrower from front to rear at the bottom than at the top, to prevent the comb from slipping down. They are also sometimes furnished with inclined bottom-boards to roll out the worms that fall upon them, or are driven down by the bees. These modifications are, however, not generally found of much importance. To protect the bees from vermin, several kinds of suspended hives have been contrived with inclined movable bottom-boards.—The dividing hives are made with several compartments, the object being to multiply, at the will of the bee-keeper, the number of colonies without the trouble and risk of swarming and hiving. When bees from any cause lose their queen, and the combs contain eggs or very young larvæ, another queen will be developed. By means of these hives, the partitions of which are supposed to divide the brood-combs, a part of the bees and of the combs are removed and placed by themselves to go on making honey, and multiplying in every respect like a natural swarm. A very large number of stocks or swarms may be thus made by a bee-keeper sufficiently experienced. The objections sometimes made against this kind of hives are: the expense of construction, the frequency with which bees are found to put all the brood-combs in one compartment, the difficulty of removing a part at just the time for the development of a new queen, and the increased exposure to cold and starvation in winter by separating the bees in the different compartments.—Several inventions have been made to enable the bee-keeper to change the combs and get the honey without driving out or destroying the bees. Changeable hives are made in sections, generally three drawers placed one above another, holes being made to allow the bees to pass. When the boxes are all filled, and it is desired to change the combs, the upper box is removed, and its place supplied by a new one put in at the bottom. This being done yearly, the entire contents of the hive would be changed every three years, and be kept new. It is held that there is a necessity for changing the brood-combs, because the larvæ hatched from the eggs and sealed up in the cells, there spin their cocoons, which remain, when they go out, upon the walls of the cells. This deposit, although extremely thin, diminishes the size of the cell, affording less room for each succeeding generation, thus causing the bees to gradually deteriorate in size. The additional advantages claimed for this kind of hive are: the facility with which small swarms may be united and large ones divided; the opportunity it offers for feeding, by putting into the hive a box of surplus honey; and the uniformity of temperature preserved by the air chamber between the

drawers and the outside of the hive. But on the other hand, the cost is considerable, and it is denied that deterioration is caused in the bees by the filling up of the brood-cells, and time and honey are therefore needlessly wasted by keeping the bees constantly making new brood-comb; this, and the difficulty of putting the swarms into the hives, and the many lurking places they afford to the bee moth, and also the difficulty of procuring, in this method of taking away honey, that which is good and free from cocoons and bee bread, more than counterbalance, in the opinion of many bee-keepers, their advantages.—Swarming-hives are sometimes used. They are made with sections, so that by closing all or a part of them, the space which the bees occupy is lessened, and they are crowded out, and their swarming hastened. Hives are sometimes arranged so as to allow the bees to go on accumulating honey and increasing in number, and not swarm at all. A hive of bees is put in a bee-house, and empty hives connected with it, so that as soon as one becomes filled the bees pass to the adjoining ones. In some instances great quantities of honey have been obtained by this method; but it has not generally been found practicable or profitable.—The result of all the experiments made in this country, with complicated and ingeniously contrived hives, and also in Europe where equally many attempts have been made to adapt artificial tenements to the simple instincts of the bee, tends to show the superiority, for practical purposes, of the simpler hives. For protection against the extremes of heat and cold in summer and winter, straw hives are excellent. In Poland, where finer honey is produced, and bees more successfully managed than elsewhere in Europe, hives are made by excavating trunks of trees, taking logs a foot or more in diameter and about 9 feet long. They are scooped out or bored for the length of 6 feet from one end, forming hollow cylinders, the diameter of the bore being 6 or 8 inches. A longitudinal slit is made in the cylinder nearly its whole length, and about 4 inches wide. Into this is fitted a slip of wood with notches on the edges large enough to admit a single bee. This slip is fastened in with wedges or hinges; if it is in several parts, it will often be found more convenient. The top is covered, and the trunk set upright with the opening toward the south. Through this door the condition of the entire swarm is seen, and the honey taken from time to time. The length of this hive and its small diameter fit it for both large and small swarms.—One of the best kind of hives is made of pine boards, an inch or an inch and a quarter thick. The best size is 12 inches square inside, and 14 deep. If to be exposed to the sun and rain, they would be better painted. The top is made of boards 15 inches square. The boards should be joined carefully; many put paint between the junctions to keep the moths from breeding in them. It saves the bees much labor if the inside of the hive is planed and

cleaned, and covered with a thin coating of melted beeswax. It should not be washed immediately before a swarm is put in, with water or spirits, or any liquid that will prevent the comb from adhering readily. Cross sticks should be put in to support the comb. Small notches should be made in the bottom of the hive for the passage of the bees. Boxes for caps or covers may be made, if the chamber-hive is not preferred, about 7 inches deep and 12 or 18 square. If glass vessels or others are to be used to receive the box honey, they may be put under these caps, or the caps may be used alone. They should fit close to the tops of the hives, several holes being made in the tops for the passage of the bees. The bottom board should be 15 inches square, at least large enough to give the bees space to alight and expatiate. It is better to give each hive a separate stand. If protection from vermin and insects is required, the hive may be placed on a single pedestal 2 feet from the ground; but if there is no danger from them nor from dampness nor snow, they may be nearer the ground. The hives need some cover from the sun and rain. A separate one for each may be easily made by putting together 2 boards, 1½ or 2 feet long, and of the necessary width, letting them incline to each other so as to form a roof. Bee houses are found not absolutely necessary, and worse than useless when not rightly constructed. It is necessary to guard against shading the hives too much in spring and fall, against preventing a free circulation of air all around them in summer, and exposing them too much in the middle of the day to the sun. The bee house should not, in cool weather, make the temperature around the hives much higher than the bees will encounter at a distance. The simple movable covers just mentioned, which are easily adjusted as the season demands, with hives made of boards of sufficient thickness, well painted to prevent warping and cracking, will generally prove an ample protection, except in winter.—The new swarms generally appear during the months of June and July, but sometimes as early as May, or as late as August. The swarms are usually hived, when the branch, or whatever they alight on, can be removed, by shaking them off in front of the hive, a little raised on one side to allow their passage. When they collect where they cannot be shaken off, and the hive cannot be placed near, they may be brushed quickly into a gauze sack or any vessel in which they can be kept and carried to the hive. It is generally irritating to the bees, and unnecessary if not useless, to endeavor to make the swarms collect by a din of horns, tin pans, and bells. They will sometimes collect on a pole with a few branches, some broom corn, or dry mullein tops or similar things fastened to the end, and held in the air. They may sometimes be arrested when going off by throwing water or earth among them. Various means are used on such occasions to disconcert them, and with

about equal success. It is very seldom that a swarm starts for its chosen destination without previously alighting. If 2 or more swarms issue at the same time and unite, they may be separated, if desired, by shaking them from the branch between 2 or more hives placed near together. Should the queens enter the same hive, the bees must be shaken out between empty hives as before, and this operation repeated till the queens separate, or the beekeeper is able to catch one or more of them, and put them with the bees where wanted. Or if there are only 2 swarms united, a part may be separated and returned to the parent hive, and the rest put in one hive; or they may all be put in one, and boxes put on immediately. It is sometimes desirable to unite small swarms; this may be easily done if they issue about the same time, by inverting one hive and placing the other over it; the bees in the lower will ascend. When for any reasons it is wished to defer for a short time the issuing of a swarm which the signs indicate to be just at hand, the bees on the outside of the hive should be sprinkled with water. This is effectual, but only before the swarm has started. Sometimes the swarm issues and returns several times; if this is owing to the inability of the queen to fly, she should be found, if possible, and put with the others in the new hive. If the weather should be such as to prevent the new swarms from going out to collect honey, several days immediately after being hived, it may be necessary to feed them.—Many beekeepers have discarded the practice of killing bees to get the honey; the surplus after enough has been stored in the hive for winter, being taken away by means of boxes, or, if they are not used, out from the hives, the bees being stupefied by sulphur or tobacco smoke. The comb is to be cut off clean so that the honey may run as little as possible upon the bees. The boxes should be put on a little before the hive is full. Polish apiarians cut out the old comb annually to lessen the tendency to swarming, and thus obtain the largest amount of honey. The old practice of destroying the bees, except those intended for wintering, after the hives are filled and the honey season has passed, still prevails extensively. La Grenée gives many reasons proving this the most profitable. The time for taking up hives depends somewhat on the season and the bee-pasturage. The quantity of honey does not increase generally after Sept. 1. To suffocate the bees, the hive is put over an inverted hive, or over a hole in the earth in which some rags smeared with sulphur are being burned. The bees fall in a short time and are buried to prevent resuscitation, and the honey removed. The bees are sometimes deprived of the entire store of comb and honey in the early part of the season, generally after the leaving of the first swarm, and driven into a new hive. When the old hive is infested with moths, or the comb is not good, and it is desirable to winter the

bees, this operation may be expedient. The effect on the bees is not generally good. It is performed by inverting the hive, and putting the other into which the bees are to be driven over it, making the junction close, and tapping with the hand or a stick the sides of the hive; the bees will pass up to the new hive, which is to be then removed to the stand.—Hives are sometimes attacked and robbed, either because they are too weak or other bees are attracted by broken honeycomb or by food put near the hive. To protect it after the robbery has commenced, the hive should be removed to the cellar, or some cool dark place, and allowed to remain 2 or 3 days. It is sometimes sufficient to close the entrance to the hive so as to admit but one bee at a time. It is beneficial to put a similar hive in the place of the one removed, and rub on the bottom board wormwood leaves or the oil of wormwood. This is so disagreeable to the bees that they speedily forsake the place. Breaking the comb in the hive of the robbers will generally make them desist.—The quantity of honey usually necessary for wintering safely a swarm of bees is 80 pounds. Those that are found in the autumn to be weak in numbers and with a scanty supply of honey should be taken up. Only the strong swarms are profitable to winter. Brown sugar made into candy by being dissolved in water, clarified and boiled to evaporate the water, is the best food for bees. The sirup should be boiled till it begins to be brittle when cooled. This or common sugar-candy may be fed to bees in the hives, under them, or in the boxes. If fed in the liquid state, it may be introduced into the hives in dishes, some contrivance being made to enable the bees to eat it without getting into it. It may sometimes be necessary to commence feeding in the autumn. It is not generally best to begin unless it is to be continued till flowers become abundant. Honey is of course the best food, yet sometimes too expensive; if candied, it is to be heated till dissolved. Feeding should never be attempted as a matter of profit. The best honey cannot be made from cheap honey and refuse sugar and molasses; it is not made by the bees but by the flowers. Of these clover is the principal source of supply. Fruit-trees, basswood, locust, and maple yield abundantly and of fine quality, buckwheat furnishes a large quantity, excellent for the winter food of bees, but inferior for the table.—The bee moth is the greatest foe the apiarian has to contend with. Many inventions have been tried without success, to protect the bees from this pest. The best safeguard is to have the hive close and well jointed, and well covered with paint, the entrances not too large, and the bees vigorous and numerous, and to examine the hive daily from about May 1, till September or October. Constant watching is indispensable. In the daytime the moths remain in their hiding-places, and may often be found around the hive. They are on the wing in the evening, hovering around the

apiary or running over the hives, endeavoring to enter and deposit their eggs. Many may be destroyed by entrapping them in shallow dishes of sweetened water with a little vinegar added. Hollow sticks, small shells, and similar things are often placed on the bottom board, where the worms hatched from the eggs may take refuge and be destroyed. It is necessary to look often under the bottom of the hive, and if one side is raised (as is required for ventilation in warm weather), under the blocks or shells on which it rests. These caterpillars at first are not thicker than a thread, are of a yellowish-white color with a few brownish dots. They live in the wax, eating it, and filling the comb with webs. They protect themselves from the bees by a sort of silken sack, which they spin, and in which they lodge. When they have attained their full size, which requires about 3 weeks, they spin their cocoons; in these they remain enclosed some time, and change to chrysalids of a light brown color, with a dark elevated line along the back. A few days afterward they are transformed to winged moths and issue from the cocoons, and are soon ready to deposit eggs for another generation. Rats and mice do not attack the hives except in winter, unless the comb is unprotected by bees.—Spiders sometimes spin their webs upon and around the hives, which entangle and annoy the bees. They are easily removed. There is a disease called "foul brood," which sometimes is very destructive to the young bees in the larva state. They die in the cells, and become black and putrid. The disease appears to be in a measure infectious. The only remedy is to drive out the bees into a new clean hive. It is the practice, in some parts of Germany, to put the bees in a temporary hive, and let them remain 24 hours, without food, in the dark, before settling them in the new hive. It is attributed sometimes to feeding the bees with foreign honey; the infection being conveyed by the honey, which, to be safely fed, should be previously scalded.—Many different methods are practised in wintering bees. It is necessary to protect them especially from 2 things: from being frozen, and from being starved. The latter happens when they collect together closely, in the coldest weather, and the comb becomes covered with frost and ice, the moisture from their bodies and from the air being there deposited and frozen, excluding them from the honey. The entrance to the hive is liable to be stopped with ice, and the bees thus suffocated. The bee never passes into the torpid state in winter, like some other insects; it perishes at a degree of cold low enough to freeze it. As in the case of other kinds of farm stock, it requires less food when kept warm and comfortable. If the hives are to be carried into a house or cellar, the place for them should be cool, dry, and dark. The best method is to house them, unless sufficient protection can be given them on the stands. The Russian and Polish bee-keep-

ers, who manage bees as extensively and successfully as any, winter their hives on the stands; but they make their hives of inch and a half plank, and wind the upper part with twisted ropes of straw or cordage to increase the protection against extremes of heat and cold. If left on the stands, hives made of common boards need additional covering; the entrance should also be narrowed so as to leave only space enough for a single bee to pass. This must not be allowed to become stopped with frost and ice, or dead bees and filth. Light snow may cover the hive without danger. The practice of bee-keepers is about equally divided between these 2 modes of wintering. The success of out-door wintering would be greatly increased by making better hives, by better protecting them from extreme cold, and from changes of temperature. It is easier and preferable, when the number of hives is very large, and there is no danger of theft, to manage them out-doors than in-doors. With a small number it may be otherwise.—The time for carrying bees out from their winter quarters is in March, except in very backward seasons. A few bright cold days will not be more destructive to them than too long confinement. If new snow has fallen, and the weather is not sufficiently warm for them to venture into the air safely, the hive may be shaded from the sun, or the bees confined in the hive. If they are to stand very near each other, it is not well to carry out too many hives at once, the bees at first not readily distinguishing their own. The hives should be raised from the bottom board only on one side, if at all. Many prefer, if the bees are not especially numerous, to let the hive rest entirely on the board, allowing less room for passage, and securing greater defence against intruders. More ventilation than this affords may be required in warm weather, when, if liable to suffer from heat, the hive may be raised entirely, proper means being furnished for the bees to ascend from the bottom board.—The careful bee-keeper has long desired to possess some method of measuring the daily increase or decrease in the weight of his hive. A recent German publication states that a German bee-keeper took the trouble to weigh one of his hives twice a day—before the bees left in the morning and after their return at night—and thus he determined the nightly loss by consumption and evaporation. These observations were continued from May 5 to August 2, a period of 91 days, and the results are very interesting. On May 5 the hive weighed 64 pounds; it lost two swarms weighing 12 pounds, yet on Aug. 2 it weighed 120½ pounds. There was no increase in weight from June 23 to July 21, except of ¼ pound on 1 day and ¼ on another, and from July 17 to Aug. 2 the whole increase was only 8 pounds. The work of each day is minutely recorded, and the results go to prove that the bee-keeper should have some means of ascertaining the weight of his hives daily throughout the season. A

method of doing this has been invented by Mr. Shirley Hibbard, of Tottenham, England. It consists of a turned pillar, made after the fashion of a telescope, working like a piston in a brass or iron cylinder. Beneath the pillar is a spiral spring on which the pillar rests. Two slots run down the side or front of the cylinder, and between them an index is marked. A finger is attached to the base of the pillar, and the hive adjusted on the top of the latter, so that as it presses down on the spring the finger marks the gross weight of the whole. A thumb-screw passes through the cylinder, and by pressing against the pillar holds it in a fixed position whenever it may be desirable.—Bee-keeping has, in some instances, been made very profitable. It is, however, uncertain. Much depends on the season and on the pasturage. The value of the best honey is, in a great degree, determined by the style and state in which it is marketed. It will generally be found most advantageous to use glass vessels or boxes, and to send the honey to market in the same.

BEECH (Saxon, *boe*, from Lat. *fagus*, Gr. *φῆγος*, verb *φαγεῖν*, to eat, the nut of the tree being eatable), a genus of Endlicher's order *cupulifera*, Lindley's *corylaceæ*, Jussieu's *quercinææ*, and of Linn. class *monacia polyandria*. The order is most nearly allied to the *betulaceæ*, or birches, and contains the genera of the oak, hazel, horn-beam, chestnut; is distinguished from all other plants by an apetalous superior rudimentary calyx, the fruit in a cup, a one-celled nut with one or two seeds, the others being abortive. The generic characters of the *fagus* are: sterile (male) flowers—ament globular, pendulous on silky thread; perianth 6-cleft, bell-shaped; 5 to 12 stamens. Fertile (female) flowers—2 within a 4-lobed prickly involucre; perianth 4 to 5-lobed; ovary 3-celled (2 abortive); styles, 3; nut one-seeded. Some branches bear male, others female flowers. The number of species is very limited, some being considered as mere varieties. In the temperate regions of the northern hemisphere, on both continents, there are extensive forests consisting of beeches; which also occur mixed with oaks, pines, firs, &c. The following are the most remarkable species: *F. sylvatica*, or common white beech: leaves ovate, acuminate, slightly toothed, ciliate on the margin, acute at base; nut ovate, 8-sided, obtuse, pointed; European; of this the American is taken to be a variety, growing in Florida and other southern states. *F. ferruginea*, or red beech: leaves oblong-ovate, acuminate, pubescent beneath, coarsely toothed, obtuse, and unequally subcordate at base; nut scutely 8-sided, muricate; most frequent in the northern United States. *F. obliqua* and *Dombeyi*, both having valuable wood and a beautiful crown; *F. procera*, scarcely less towering in height than the araucaria; *F. pumilio*, a dwarf species growing above the region of trees, on lofty mountains—are all natives of the Andes of southern Chili. Some species grow in the Magellanic regions; others in Van Diemen's Land and the

colder parts of New Zealand. The varieties of the European *F. sylvatica* are: *F. purpurea*, whose bright blood-colored leaves, when tossed by the wind in sunshine, seem to be flames; *F. cuprea*, with copper-colored shining leaves; *F. asplenifolia*, with some leaves entire, and others cut into narrow strips; *F. pendula*, or weeping beech, with branches drooping to the ground; *F. cristata*, with ragged crest-like leaves; *F. variegata*, with leaves spotted with white; *F. latifolia*, with chestnut-like leaves, &c. All these are ornamental trees.—The beech is easily propagable by seed; also by grafting, budding, and in-arching. It thrives in a deep moist soil (on the Ohio some attain 100 feet in height), but also succeeds well in rocky soil, in heaps of stones under cliffs, even in shaded situations. When crowded by its kindred, or by other trees, its stem rises pillar-like even to 80 feet in undiminished thickness, before branching into a tufty crown, reminding one of Gothic halls. Standing alone, it sends forth branches at from 10 to 80 feet above the root, at a large angle, far and wide, the lower ones almost horizontal, while the upper rise to form a majestic crown. In depth of shade it is scarcely equalled by any other tree. Its light grayish, or leaden-greenish, smooth, shining bark, its rich green, shining foliage, which appears earlier than that of the oak, from long buds in tender drooping jets, and which is tinted yellow, reddish, and brown in the autumn, remaining often through the winter on the tree, recommend it for avenues, plantations, and clumps. Of these there are many in Normandy and other parts of Europe, which abound in beech forests. The diameter of the common beech seldom surpasses 3 feet. The tree scarcely bears fruit before the 50th year of its age, and then not every year. After the 140th year, the wood-rings become thinner. The tree lives for about 250 years. Some stems are fluted, some even twisted. The roots stretch far away, near to the surface of the soil, partly above it. Young beeches are useful for live hedges, as they bear pruning, and as their branches coalesce by being tied together, or by rubbing each other. Amputations of limbs, and deep incisions in the tree, soon become obliterated by the bark, which contains a peculiar periderma. The wood is yellowish-white in the common beech, brownish in the red; very hard, permeated by transverse lighter-colored pith-rays and shorter rays, so that the longitudinal fibres are somewhat waving. Its close wood-cells, with thick walls, afford a great quantity of heating material, and of potash, so that the wood ranks next to hickory, oak, and maple, as fuel. It is easily decayed by alternation of dryness and moisture, and is unfit for many purposes; but it is good for cylinders for polishing glass, for plane stocks, chair posts, shoe lasts, tool handles, wheel felloes, cart bodies, rollers, screws, bowls, even for ship-building, where no better timber can be obtained. It is incorruptible when constantly under water. The tree is so rarely struck by

lightning, that woodmen and Indians consider themselves safe when under its shelter. Very good oil may be pressed from the beech nut, almost equalling that of olives, and lasting longer than any other after proper purification. Wild animals feed on the nut, swine are fattened on it, and people eat it in Europe; too freely eaten, it produces giddiness and nausea. The husks of the nut contain *fagine*, a peculiar narcotic extractive principle.

BEECHER, LYMAN, D. D., an American clergyman, born at New Haven, Conn., Oct. 12, 1775, graduated at Yale college in 1797, and studied theology under the direction of President Dwight. In Dec. 1798, he was ordained pastor of a church at East Hampton, L. I., upon a salary of \$300 per annum. In 1810 he removed to the care of the first church, at Litchfield, Conn. Here he remained about 16 years, during which time his remarkable qualities as a preacher and as a zealous and active minister, brought him a great reputation and a remarkable influence throughout New England. He was much consulted, and was forward in most of the religious undertakings of the time, such as the Connecticut missionary society, the Connecticut education society, the American Bible society, and the like. In 1826 great defections had taken place in the churches in Boston and the neighboring parts of New England into Unitarianism, following the lead of Dr. Channing and others in sympathy with him, and Dr. Beecher was chosen, out of all the clergy of New England, to uphold the standard of the ancient Puritan faith against their desertion. He was installed over the newly established Hanover street church, Boston, and, during his residence there, devoted himself with both zeal and ability to the urgent work committed to his guidance. His ministry necessarily partook largely of a controversial character. He flung himself into the thickest of the battle, and was sustained by the confidence and fervent admiration of the religious body to which he belonged. The sincerity and spirituality of his preaching was generally acknowledged, and it was attended by decisive results, in a revival of the spirit and increase in the numbers of evangelical Christians, so as still to preserve to them the numerical superiority in that part of the country, at one time thought to be seriously in danger. In this work Dr. Beecher was looked up to as the most efficient champion and defender of the faith. But he was not of a mind to rest while any thing remained to be done. The vital importance of communicating sound religious influences to the population of the great Mississippi valley became the paramount interest in the minds of many reflecting as well as philanthropic people, for the highest social and political as well as religious considerations were concerned. Among many similar institutions founded for this purpose, the Lane theological seminary was established at Cincinnati, and Dr. Beecher was invited to take the direction in 1832. He carried the same strength

and ardor into his new connections, and electrified a considerable part of the country by the publication, soon after his arrival, of a tract sounding the alarm of Roman Catholic supremacy at the West. The transplanting of a mind of such vigor into that impressible society could not be of slight effect. His great character, uniform principles, and fixed adherence to truth and his convictions, together with his boldness and fervent eloquence, worthily filled a large sphere of duty and produced a serviceable impression upon western society. He remained in Cincinnati about 10 years, having, in addition to the care of the seminary, the pastoral charge of the second Presbyterian church. Since leaving there he has resided mostly in Boston, without fixed employment, but with undiminished intelligence and vigor even at a very advanced age. During the more active portion of his life few or none of his profession were better known to the people of the United States, and it is probable that the labors of no other have produced a more immediate and apparent effect. His fame as an orator was naturally the most prominent, and as such he possessed remarkable powers. His style was that of a man thoroughly in earnest, whose life was devoted to the inculcation of great truths, and whose convictions were of a heat to melt all obstacles. Original turns of thought and expression, and flashes of pictorial illustration, were frequent in his oratory, and gave him an electrical influence over his audience. His position as a theologian will be judged with that of the body for which it may properly be said he combated, but it was sustained by sterling qualities which were universally recognized. In almost all the conspicuous moral enterprises of his time he has borne a prominent part, and in particular his connection may be mentioned with the temperance movement, which for 80 years has elicited and absorbed so much of the moral life of this country. Early in its course he printed a famous series of sermons on intemperance, which attracted much attention to the cause. His numerous publications have been mostly occasional and miscellaneous, and hardly of a kind to perpetuate his influence. Dr. Beecher has been 8 times married, and has been the father of 18 children, of whom several have attained to eminence as writers and ministers.—**CATHERINE ESTHER**, eldest daughter of the preceding, born at East Hampton, L. I., Sept. 6, 1800, where she resided till she was about 10 years of age. She received her early education at Litchfield, and soon after leaving school, experienced a great calamity, to which she alludes in her writings as the crisis of her life. This was the death of Prof. Fisher, of Yale college, to whom she was betrothed, and who lost his life by shipwreck on the coast of Ireland. This event threw a deep cloud over her mind, from which she slowly emerged to find consolation in a life of activity. In 1822, she opened a female seminary at Hartford, Conn., where she continued the work of instruction for the next 10 years,

during which time she made her appearance as the author of a manual of arithmetic, and of elementary books of instruction in theology and mental and moral philosophy. She accompanied her father, in 1832, to Cincinnati, where, for 2 years, she was at the head of an institution for female instruction. Obligated to resign by failing health, she conceived and undertook the development of a plan for female Christian education, to be promoted through a national board, with high schools and normal schools to provide a sufficient supply of well-instructed teachers. This has been made the guiding purpose of her life, for which she has written, travelled, and exerted all the influence of her active mind, in all parts of the country, for many years. The incidents of this grand scheme have frequently led her before the public in essays in authorship. Among these are "Domestic Service," "The Duty of American Women to their Country," "Housekeeper's Receipt Book," "The True Remedy for the Wrongs of Woman," "Treatise on Domestic Economy." She has recently published a work on physiology and the condition and habits of American women, and the first volume of a course on theology and moral philosophy, in which she makes some striking departures from the Calvinistic theology.—**EDWARD**, eldest son of the Rev. Lyman Beecher, born 1804, graduated at Yale college 1823, studied divinity at Andover and New Haven, tutor in Yale college 1825, pastor of Park st. church in Boston, 1826-'31, president of Illinois college at Jacksonville 1831-'44, pastor of Salem st. church in Boston 1846-1856, and is now pastor of a church in Galesburg, Ill. He has published "Conflict of Ages," "Papal Conspiracy," and a work on Baptism.—**HENRY WARD**, minister of Plymouth church, Brooklyn, N. Y., son of the Rev. Lyman Beecher, born in Litchfield, Conn., June 24, 1818, graduated at Amherst college, Mass., in 1834, and studied theology under his father, at the Lane seminary, Cincinnati. He was first settled, in 1837, as Presbyterian minister at Lawrenceburg, Indiana. After a residence of 2 years, he removed to Indianapolis. He remained there till 1847, when he accepted an invitation to become pastor of the Plymouth church, in Brooklyn, N. Y., an organization of orthodox Congregational believers, an office which he still continues to occupy. Beside occasional addresses, he is the author of a volume of "Lectures to Young Men," and editor of the "Plymouth Collection of Hymns." He was also one of the founders of the "Independent," a weekly religious newspaper of New York, to which he has been a constant contributor, his articles being signed with an asterisk. A volume of these articles has been collected under the name of the "Star Papers." As a popular lecturer, he has appeared very generally before the lyceums of the country. As a preacher, he is said to have the largest uniform congregation in the United States. Discarding many of the usual formalities of his profession, he addresses himself with vigor to the hearts and under-

standings of his hearers, and with all the more effect on account of the greater range of topics, as well as of style and illustration, which he has introduced. Born an orator, the smiles and tears of an audience are at his command, and in his sermons, no less than in his lectures, they are both aroused. As a moralist and politician he is opposed to the institution of slavery, and, in the presidential contest of 1856, he took an active part in favor of the republicans, not only with his pen, but by addressing mass meetings in various parts of the northern states.

BEECHEY, FREDERIO WILLIAM, British admiral, arctic navigator, born in London in Feb. 1796, died there Nov. 29, 1856, eldest son of the late Sir William Beechey, portrait painter. He entered the British navy as a volunteer, at the age of 10, and saw a great deal of service (including the contest at New Orleans) during the 12 years following. In 1815 he was made lieutenant; in 1818 he sailed in the *Trent*, under Franklin, on his first voyage of arctic discovery, acting as artist to the expedition. In 1819 he went as lieutenant in the *Hecla*, under Sir Edward Parry, in his first arctic voyage. In 1821 he was commissioned (with his brother, H. W. Beechey) to make a survey of the north coast of Africa, from Tripoli to Derne. He was raised to the rank of commander, and sent out, in 1825, in the *Blossom*, on another arctic expedition, *via* Cape Horn, to act in concert with Franklin and Parry, and, having passed Behring's straits, reached, in Aug. 1826, a point north of Icy cape, reaching in boats  $71^{\circ} 23' 81''$  N. lat., and  $156^{\circ} 21' 30''$  W. long.—only 146 miles from the extreme point simultaneously reached by Franklin. As they were not aware of each other's position, neither advanced. Commander Beechey subsequently discovered, in 1827 (in which year he was made post-captain), 2 secure harbors, south-east of Cape Prince of Wales, and near to Behring's straits, which he named Port Clarence and Grantley Harbor. He returned to England, after an absence of nearly 3 years. Between 1829 and 1839, he was employed in making surveys of the coasts of South America and Ireland. In 1854 he was appointed rear admiral of the blue. In 1828 he married a daughter of Col. Stapleton.

BEECHEY, SIR WILLIAM, English portrait painter, born at Burford, Oxfordshire, Dec. 1753, died at Hampstead, near London, Jan. 1839. He was articled, first to a conveyancer in the country, and then to a London attorney, but procured his release, at the age of 19, and became a student of the royal academy, and closely imitated the style of Sir Joshua Reynolds. For some time he confined himself to portraits at Norwich, but having executed some small pieces in the manner of Hogarth, which were very successful, he returned to London, where he obtained numerous commissions for full-length portraits. In 1793 he was elected associate of the royal academy, and appointed portrait painter to Queen Charlotte. In 1797,

having painted a good picture of George III., he was knighted.

BEEFEATERS, the yeomen of the queen of England's guard. They are now merely remnants of the ancient pomp of feudal royalty, and only act as warders at the Tower, and as attendants on the queen's state coach on occasions of high ceremonial, such as coronations, the opening and prorogation of Parliament, and similar processions. At state royal dinners, they are on duty at the side-board, as their name (corrupted from *buffetiers*) implies, recalling probably the time when kings were not so sure of the loyalty of their guests, but that the presence of an armed life-guardsmen at the buffet was an agreeable addition to their sense of security. Readers of romance will remember the fine scene in Quentin Durward, where Louis XI. conceals an archer of his guard, with loaded arquebuse and lighted match, behind such a piece of furniture, during a solemn banquet given to the envoy of Burgundy. The beefeaters are now only 100 in number, but are interesting from the fact that they wear the exact dresses, flat black velvet berrets, and slashed doublets of black, blue, scarlet and gold, with gilded partisans for weapons, which they wore in the reigns of Henry VIII. and Elizabeth; so that, on a visit to the Tower, they add much to the effect of the scene.

BEELZEBUB, a compound of Baal, though concerning the terminal part of the word there has been much difference of opinion. Some writers translate the term "god of flies," and assign two reasons for it, either or both of which may be true or false, viz.: that he protected the people against noxious insects, or that he was so called in derision by the Israelites when they wished to speak disrespectfully of the religion of their Moabitish neighbors. Others translate the term still more disrespectfully, "god of ordure," while others still, changing the word to Beelzebath, render it "god of hosts," or Beelzebul, "god of heaven." It appears very certain that he was regarded in New Testament times as an evil demon, for Jesus was accused of casting out devils by "Beelzebub, the prince of devils," and he is perhaps the same deity elsewhere styled the prince of the power of the air. Such deities were common in the worship of the ancients, being but a modified form of the oriental dualism, which recognized a good deity and an evil one.

BEEMSTER, one of the *polders* or tracts of drained land of the Netherlands, area 8,000 acres, containing a neat village. The inhabitants are chiefly employed in raising sheep and cattle.

BEER (Germ. *bier*), a fermented liquor made from malted grain—in Europe most commonly from barley, but in this country from wheat as well, and in India from rice. Corn, oats, peas, and other similar articles of food, may be used also for this manufacture. Hops, and other bitter flavoring matters, are added to improve the taste, and impart their peculiar properties to the liquor. The name beer is also given in this country and in Britain to several

partially fermented extracts of the roots and other parts of plants, as spruce, sassafras, ginger, &c.; most of which are designated by the term root-beers. But as generally used in Europe it is applicable only to liquors prepared by malting, and seasoned with hops or other bitters. The drink in some of its varieties appears to be of great antiquity, and was probably discovered by the Egyptians. Tacitus notices it as being in common use with the Germans of his time. Pliny describes the *celia* and *ceria*, the beer of the Spaniards, and the *cerevisia* of the Gauls, made from almost every species of grain, and evidently named from Ceres, the goddess of corn. Aristotle speaks of its intoxicating qualities, and Theophrastus very properly calls it the wine of barley. Herodotus (450 years B. C.) stated that the Egyptians made their wine of barley. An ancient description by Isidorus and Orosius of the process in use by the Britons and Celtic nations defines the liquor as not differing essentially from that now made. "The grain is steeped in water and made to germinate, by which its spirits are excited and set at liberty; it is then dried and ground, after which it is infused in a certain quantity of water; which, being fermented, becomes a pleasant, warming, strengthening, and intoxicating liquor." Beer is a nourishing drink from the gum, sugar, and starch it holds in solution; and the bitter substances combined with it impart their tonic properties. The proportion of alcohol is small. In the Edinburgh ale it has been found by Mr. Brande to amount to 6.20 per cent.; in brown stout, to 6.80; Burton ale, 8.88; London porter, 4.20; small beer, 1.28. Burton, or the pale India ale, as found by Hoffman, contains in 100 parts: water, 78.87; extract of malt, 14.97; absolute alcohol, 6.62; and carbonic acid, 0.04. Pale ale consists of the same ingredients, in the following proportions: water, 89.74; extract of malt, 4.62; alcohol, 5.57; carbonic acid, 0.07. Lactic acid, aromatic matters, and various salts, are detected in the extract. If, by continued fermentation, the sugar is all converted into alcohol, the acetous fermentation is likely to ensue, and the beer then passes into vinegar. For the present process of manufacture, see BREWING.—Lager bier is beer that has been stored for some months in vaults. Its name is nearly equivalent to the English name, "stock" ale. The vaults are made of great capacity, often of stone, under the breweries; and such receptacles are essential in the production of good lager bier. It is a favorite drink with the Germans, and the demand for it with this class of our population has led to its extensive manufacture in this country. As in Bavaria itself, its use is almost an essential article of diet with the laboring classes, and to some extent it takes the place of animal food. Drunk as it often is to the amount of more than a gallon a day, but little other food than bread is required to satisfy the appetite. But this free use of it should be

condemned, from the tendency to produce apoplexy and palsy.—The stronger beers, like those of northern Germany, are especially objectionable from their dangerous effects upon the health.—For the following analyses of several of the best known European and American beers, we are indebted to an excellent paper upon this subject, published by Fenner von Fenneberg, of New York city:

	Water.	Malt.	Alcohol.	Carbonic acid.
Larchel's "Holy Father Beer,"				
Munich.....	81.95	12.08	4.94	0.08
Salvator beer, Munich.....	87.83	7.97	4.50	0.30
London ale.....	76.08	15.88	8.08	0.01
Double porter, Barclay, London.	88.74	5.98	6.10	0.18
Pale ale, London.....	89.85	4.50	5.65	—
Philadelphia lager bier.....	92.16	4.86	8.40	0.06
Reading lager bier.....	91.80	4.68	8.78	0.18
Walter's lager bier, Williamsburg	91.80	4.65	8.44	0.11
Bavarian lager bier, Munich.....	90.95	4.70	4.84	0.04

At the date of this paper (1854), it was stated there were no less than 27 breweries in the city of New York, several of which brewed more than 10,000 barrels, of 80 gallons each, of lager bier in the course of the year. In Williamsburg there were 13 breweries; in Brooklyn, 8; on Staten Island, 8; in Albany, 8; Buffalo, 7; Philadelphia, 28; Pittsburg, 11, &c. The production of those of New York was estimated at 85,000 barrels of lager bier, and from other places were introduced 17,500 barrels more, making the consumption of the city at that time about 8,075,000 gallons. The cost of a barrel, which varies with that of grain and hops, was estimated from \$3 50 to \$4. Hops then cost from 45 to 50 cents per pound, and a bushel of malted barley from \$1 37 to \$1 50. To produce 40 barrels of lager bier there are consumed 50 bushels of malt, 60 pounds of hops, and 3 gallons of yeast. A single brewing of this quantity requires  $\frac{1}{2}$  a ton of coal. The hands in a German brewery are paid monthly from \$10 to \$25, beside their full board and free use of as much beer as they can drink. The season for brewing begins late in October and closes early in April.

BEER. I. WILHELM, a brother of Meyerbeer, the great composer, born Feb. 4, 1797, died March 27, 1850. He was established as banker at Berlin, and in 1849 he became a member of the Prussian diet. His claim to notice rests upon his achievements in the sphere of astronomical science. His labors in this department were associated with those of the astronomer, Mädler. Beer built an observatory, chiefly devoted to the observation of the planet Mars and the moon. The crowning labor of the 2 astronomers was a map of the moon, published in 1836, upon which the Lalande prize was conferred by the French academy. II. MICHAEL, a brother of the preceding, born in Berlin, 1800, died in Munich, March 22, 1838, became known to the literary world by 5 tragedies, of which his *Struensee* is the best. His complete works were published at Leipsic in 1835, and his "Correspondence" in 1837. (See MEYERBEER.)

BEEREN, Grossa, a Prussian village, pop. 242, memorable for the great battle of the 22d and

28d of August, 1818, in which the French troops were defeated by the Prussians.

BEERNEM, a village of Belgium, 5 miles S. E. of Bruges. It has trade in cattle and in linen goods, and has also mills for flour, malt, and oil. Pop. in 1851, 8,440. The village is the seat of the reform school for girls under the charge of the sisters of charity, the complement of the reform school for boys at Ruyselede. The pupils are instructed in every department of household duty, as well as in the elements of common school education. The discipline of the school is that of kindness and affection only.

BEERS, NATHAN, an officer of the army of the revolution, born at Stratford, Ct. 1758, died at New Haven, Feb. 10, 1849. While still quite young, he went with his father to New Haven, and was a member of a military company formed there in 1774, which was commanded by the celebrated Benedict Arnold. Immediately on the receipt of the news of the battle of Lexington, the company was called together by their captain, and Beers with 89 others volunteered to accompany him to the seat of war. They immediately set out, and, as they passed through Pomfret, were joined by Gen. Putnam. Beers received a lieutenant's commission in the army in 1777, and served until 1788. He was afterward engaged, for a time, in mercantile affairs, and, in 1798, was chosen steward of Yale college, which office he resigned in 1819. He was a man of integrity, courtesy, and piety.

BEER-SHEBA. As the traveller to Palestine emerges from the desert of Sinai, upon the southern frontier of the holy land, he begins to meet with deep artificial excavations, often through solid rock, and covered with stone slats. These are the wells of Palestine. Among the first that greet him are the wells of Beer-sheba. This place of Old Testament renown, as identified in the 14th century, is situated about midway between the southern point of the Dead sea and Rafa on the Mediterranean, and is at present known as Bir-es-Seba. The name signifies "the well of covenant," and doubtless was so designated to commemorate the covenant between Abraham and Abimelech. Near it Abraham planted a grove of tamarisks. A town of some importance naturally grew up, in those desert places, around a well. Beer-sheba lying on the southern frontier of Palestine, and Dan on the northern, "from Dan to Beer-sheba" came to be used to signify the entire extent of the country. Dr. Robinson found still 2 circular wells in tolerable preservation, about 55 rods apart, one 44 feet deep to the water, and the other only about 12 feet, the deeper one excavated through solid rock for the lower 16 feet. It was generally much labor to construct these wells, and from their importance in so desert a country, we can well understand how the strife arose which in its adjustment gave the name to Beer-sheba. This town fell originally to Judah, but was afterward transferred to Simeon. It was an important

judicial station under Samuel, and a seat of idolatry in the time of Uzziah. From this time we lose sight of it until it is mentioned again in the 4th century of the Christian era by Jerome and Eusebius, as a flourishing village.

BEET, a plant of the genus *beta*, belonging to the natural order *chenopodea*, among which it is known by its large succulent roots and a green calyx united half way to a hard rugged nut. The species are found in Europe, the north of Africa and the western parts of Asia. Four species of this genus are cultivated as esculents; the others are mere weeds. The common beet, or *beta vulgaris*, is found in a wild state in Egypt and along the whole of the sea-coast of the Mediterranean. There are several varieties, differing in the form, size, color, and sweetness of their roots. The "small red" and the "long yellow" are the most sweet and delicate, and have the richest color when served at table. Beet roots can only be obtained in perfection in a rich, light, sandy soil, through which they can easily penetrate. In stony or stiff soils the roots become parched and lose their succulence. Mangel-wurzel, or *beta altissima*, is a much larger and coarser plant than the common beet, from which it differs by its roots being marked internally with zones of red and pink or white. Its native country is unknown. It is extensively cultivated in Europe for feeding cattle; its leaves affording a very nutritious food for all kinds of live stock, and its roots, from their exceeding sweetness, being considered one of the most valuable plants on which cattle can be fed in winter. There are few crops so valuable for this purpose. Swedish turnips, or *ruta baga*, exceed them in the quantity of nourishment, weight for weight; but on good light soils the produce of the beet per acre is much greater. The proportional value of hay, potatoes, Swedish turnips, and beets in feeding cattle, is said by Einhof and by Thaer to be as follows: 18 tons of mangel-wurzel are equal to 15 tons of Swedish turnips, or  $7\frac{1}{2}$  tons of potatoes, or  $8\frac{1}{2}$  tons of good English hay, each quantity containing the same amount of nourishment; but the roots may be grown upon less than an acre of ground, while two or three acres of good grass land are required to produce the equivalent amount of hay. The beet root is also deemed the least exhausting to the land.—The white beet has been chiefly cultivated for the purpose of extracting sugar from its juice. It is smaller than the mangel-wurzel and more compact. The manufacture of sugar from beet root was first commenced in France in consequence of the Emperor Napoleon's scheme for excluding British colonial produce. It was known that a crystallizable sugar could be obtained from the juice of the beet root, and he encouraged the establishment of beet root sugar manufacture on a large scale, by every advantage which monopoly and premiums could give it. Colonial sugar was sold as high as a dollar a pound; and as sugar had become an indispensable luxury in France, the

manufacture had every chance of rapid and complete success, although the process was expensive. It has since been much improved, and beet root sugar now competes on nearly equal terms with colonial or cane sugar, in the markets of the world. Most of the operations in manufacturing beet root sugar are nearly the same as those by which the juice of the sugar cane is prepared for use, but much greater skill and nicety are required in rendering the juice of the beet root crystallizable, owing to its greater rawness and the smaller relative proportion of sugar it contains. When beet root sugar is refined, however, it is said to be impossible for the most experienced judge to distinguish it from the other, either by the taste or the appearance. Five tons of clean roots produce about 4½ cwt. of coarse sugar, which gives about 160 lbs. of double refined sugar and 60 lbs of inferior lump sugar; the rest is molasses, from which spirits of good quality are distilled.—The chard beet, or *beta cyclo*, inferior in the size of its roots, is remarkable for the thickness of the ribs of its leaves, which are white, yellow, green, orange colored, or deep crimson, in different varieties. It is cultivated like the common beet in gardens, and forms one of the principal vegetables used by agricultural laborers and small occupiers of land in many parts of Germany, Switzerland, and France. Swiss chard produces numerous large succulent leaves, with a very solid rib running along the middle. The leafy part stripped off and boiled is used as a substitute for greens and spinach; the rib and stalk are dressed like asparagus or *soorzeners*; they have a pleasant sweet taste, and are deemed by some persons more wholesome than the cabbage tribe; but in other varieties, they have an earthy taste which is unpleasant.—Sea beet, or *beta maritima*, is a perennial, and one of the most valuable plants known for greens. It thrives in gardens without any sort of care, and is increased by seeds which it yields in great abundance.

**BEETHOVEN.** I. **LUDWIG VAN**, probably a native of Maestricht in Holland, was a base singer of considerable reputation, in the electoral chapel at Bonn, and in opera. About 1761 he was elevated by the elector Maximilian Frederick to the position of *kapellmeister*, which office he seems to have held until the appointment of Lucchesi in 1771. He composed several operas, none of which, however, are now preserved. He died Dec. 24, 1773. II. **LUDWIG VAN**, one of the greatest of musical composers, son of Johann van Beethoven, a tenor singer in the electoral chapel at Bonn, and grandson of the foregoing, born Dec. 16 or 17, 1770, died at Vienna, March 26, 1827. He was the second of 4 children, the first of whom died in early infancy. The habits of Johann van Beethoven were bad, and soon after the death of *Kapellmeister* Beethoven the family sank into poverty. It is probable that Ludwig exhibited proofs of his remarkable musical talents at a very early age, and that his father indulged the

hope of deriving fame and profit from his precocity, as had then very recently been the case with Leopold Mozart and his son Wolfgang, for before the boy was 4 years of age, he was placed at the harpsichord, and forced, unrelentingly, to perform his daily task of exercises. He soon required better instruction than his father could give, and became successively the pupil of Pfeiffer, oboist in the chapel, and of Van der Eder, court organist. In 1781 Van der Eder was succeeded by C. G. Neefe, and the pupil was transferred to him. A musical periodical of that day, in a letter describing the musical establishment at Bonn, probably written by Neefe himself, includes the boy among the musicians, and speaks of him thus: "Louis van Beethoven, son of the above-named tenorist, a boy of 11 years and of very promising talents. He plays the harpsichord with great skill and power, reads well at sight, and, to say all in a word, plays nearly all of Sebastian Bach's *Wohltemperirtes Klavier* placed in his hands by Herr Neefe. He that knows this collection of preludes and fugues in every key (which may almost be called the *no plus ultra* of music) will know what this implies. Herr Neefe has also, so far as his other duties allow, given him some instruction in thorough base. At present he is exercising him in composition, and for his encouragement has caused 9 variations composed by him upon a march, for the harpsichord, to be engraved at Mannheim." Beside these variations, we possess a specimen of his powers at this early age, in 8 piano-forte sonatas, dedicated to the elector and printed at Spire. In 1788 the elector died, and fortunately for the young Beethoven was succeeded by Maximilian Francis, a member of the music-loving family of the empress Maria Theresa. Attached to the young elector's court was a certain Count Waldstein, his bosom friend, a practical musician and familiar with the music of Vienna, where, at that time, Gluck, Haydn, Salieri, Righini, &c., reigned supreme. The count soon discovered the promise of the boy, and became his protector. Through his influence, Beethoven, in his 15th year, was appointed assistant court organist, and in his 18th was sent to Vienna at the elector's expense, to study with Mozart. The illness of his mother recalled him to Bonn, and her death about the end of July, 1787, doubtless was the cause of his remaining for the present there, for, owing to the habits of his father, the support of his two young brothers, Kasper Anton Karl, born April 8, 1774, and Nicholas Johann, Oct. 2, 1776, must, in a great measure, have devolved upon him. The 4 succeeding years must have been years of great exertion to the young man. His salary could not have been large, either as organist or as member of the orchestra, in which he played the viola; nor were the profits of teaching great. His position in the orchestra as player of the viola would be a sufficient refutation of the oft-told anecdote of Beethoven and the spider, did we not know that the real hero of the story was Berthame,

a Parisian violinist. In 1792, his brothers being off his hands (Karl a music teacher, and Johann an apothecary's boy), Beethoven was again in a position to accept the elector's kindness, and returned to Vienna; which capital, and its environs, save upon a single visit to Berlin, one or two to Prague, and his summer journeys for health to various watering places, he never again left. The young composer reached Vienna a few weeks before completing his 22d year. With the modesty of real talent he suppressed all his previous attempts at composition, and came before the public only as a piano-forte virtuoso. In this field he had but one rival—for Mozart had died the year before—Joseph Woelfl; and the only rivalry between them was in execution, of which Woelfl was an astonishing master. In force, fire, and originality of conception, Beethoven was far the greater of the two. The first 5 years of his sojourn in Vienna were the happiest of the composer's life. He mingled in the best society, was the favorite of people of the first rank, and was placed at the head of his profession by the best judges. In the mean time he was making himself master of musical form, studying successively with Haydn and the renowned contrapuntist Albrechtsberger, kapellmeister at St. Stephen's. The somewhat dry but thorough course of study pursued under the latter, may be followed by the musical student in the work known as "Beethoven's Studies," which is made up from the lessons original and selected given him by his teacher, and is often enriched by the shrewd, witty, and caustic remarks of the gifted pupil. The annexation of Cologne to the French empire, and the expulsion of the elector, at length left Beethoven free to remain in Vienna and devote himself to composition, the science of which he had now thoroughly mastered. The first important works which he sent to the press were the 8 sonatas, op. 2, and the 8 trios, op. 1, but others followed with a rapidity truly astonishing. It is not possible to arrange the works of this master in the order of their composition, and to decide how many, of his earlier productions especially, belong to a given period. It is certain, however, that before the close of the last century the list included many variations and songs, more than 20 sonatas for the piano-forte solo, 8 (probably more) sonatas for piano-forte and violin, 8 for piano and violoncello, 3 trios for piano, violin, and violoncello, that in B $\flat$  with clarinet, the quartet for piano and bowed instruments, the quintet for piano and wind instruments, the concertos in C and B $\flat$  for piano and orchestra, 5 trios, 6 quartets, the quintet in E $\flat$  for bowed instruments, the septet, the ballet "Men of Prometheus," and the 1st and 2d symphonies! Such fertility certainly promised a career in no respect behind those of Handel, Bach, Haydn, and Mozart. But he was already suffering from a calamity which afterward greatly limited his productiveness, but which we may consider the cause of the profound depth of sentiment, feeling, and passion, which

is the leading characteristic of the music of Beethoven. In a letter to his friend, Dr. Wegeler, dated June 29, 1800, he says: "My hearing has been gradually becoming weaker for 8 years past." The original cause of this misfortune was a hemorrhoidal difficulty, and a consequent chronic weakness of the bowels, attended with violent colic. He describes the symptoms of his case and its treatment by physicians, and adds: "I may say that I feel myself stronger and better in consequence, only my ears—they are still ever ringing and singing day and night. I can truly say that I pass a wretched existence; for the last 2 years I have almost entirely shunned society, because it is impossible to tell people I am deaf!" Again: "In the theatre I am forced to lean up close to the orchestra to understand the actors. The higher tones of the voices and instruments, if I am at a little distance, I cannot hear, and it is remarkable that people do not notice it in conversation with me." In the summer of 1802 he had a dangerous attack of illness, and in the prospect of death, wrote a remarkable paper, addressed to his brothers, in which he paints the sufferings which he had passed through in very powerful language. We quote a few lines: "Born of an ardent, sanguine temperament, and peculiarly susceptible to the pleasures of society, yet at this early age I must withdraw from the world, and lead a solitary life. When I at times have determined to rise superior to all this, oh, how cruelly have I been again cast down by proofs doubly painful of my defective hearing, and yet it has been utterly impossible for me to say to people, 'Speak louder, scream, for I am deaf!' Ah, how could I proclaim the weakness of a sense which I ought to possess in a higher degree than others, which once I did possess in the highest perfection—a perfection equalled by few of my profession. Alas, I cannot do this! Forgive me then, if I draw back when I would gladly mingle with you. My misfortune inflicts upon me a double woe in causing me to be misapprehended. For me there can be no recreation in social intercourse, no joining in refined and intellectual conversation, no mutual outpourings of the heart with others." Again: "But what humiliation, when some one standing by me hears a distant flute, and I hear nothing, or listens to the song of the herdsman, and I hear no sound. Such incidents have brought me to the verge of despair—a little more, and I had put an end to my life. One thing only, art—this restrained me. I could not leave the world until that was accomplished which I felt was demanded of me." This period was a crisis in his life. Upon his recovery from his illness, though he had little hope of ever recovering his hearing, he became more patient and cheerful, and again wrought out his musical inspirations with great industry. Among the numerous compositions of the few following years are several of his capital works. The "Heroic Symphony" was produced in 1804; "Fidelio"

in 1805; the 4th, 5th, and 6th symphonies, and the mass in C, during the 4 following years. It is a common impression, that the ill success of his opera, "Fidelio," discouraged Beethoven ever after from attempting dramatic compositions. His negotiations with various poets, Körner, Rellstab, Grillparzer, Bernard, for a libretto, even down to the close of life, and especially a formal written proposition dated in 1807, and still in existence, to the management of the imperial theatres for an engagement as regular composer, show how erroneous is the impression. What prevented the acceptance of Beethoven's proposition by the managers is not now known. The music to Kotzebue's "Ruins of Athens" was first performed in 1812; the "Battle of Vittoria" and the 7th symphony in the autumn of 1813; the cantata, "The Glorious Moment," at the Vienna congress in 1814; and the 8th symphony was written as early as 1816. The labors of the summer of 1815 were principally devoted to the arrangement of the Scottish songs for George Thompson of Edinburgh. From this period the works of Beethoven followed each other in still less rapid succession, not only from the grandeur and extent of their designs, but from the effects produced upon him by a legal process, which claimed much of his attention, and caused him the deepest anxiety. The last half-dozen sonatas, those giants of piano-forte composition, the grand mass in D—a 3 years' labor—the overture in C, op. 115; the 9th symphony, with chorus, completed in 1824, the last grand quartets, were the principal productions of his last 10 years. The legal process above mentioned was too important in its influence to be passed over without some notice. Karl van Beethoven had been unfortunate in his marriage, and upon his death in 1815 had left his son to the special care and protection of the composer. The mother, although she soon became the kept mistress of a citizen of Vienna, refused to part with her son, and Beethoven was forced to bring the case before the courts. The will of the father was not sufficient ground by the laws of Austria for removing the child from his mother, nor his legal adoption by his uncle. It became necessary for Beethoven to prove the bad character of his sister-in-law, and show that the moral welfare of the boy demanded his removal from her influence. This, to a man who in the corrupt society of Vienna had lived a blameless life, and who had his friends and acquaintances principally among princes and the nobility, was in the last degree mortifying. Its effect upon him was so great that nothing but the necessity of meeting the large expenses entailed upon him by the process, and by his adoption of the boy, induced him to meet the demands of his publishers. During 3 years not one of his great works was produced. The suit was originally brought in 1816, in the court in which the causes of the nobility were tried, and after 2 or 3 years, during which the boy was sometimes in possession of the mother

and at others of the uncle, was decided in favor of the latter. The opposing counsel thereupon brought a technical objection to the proceedings, viz., that Beethoven was not of noble birth, and could not bring suit in this court; that *even* in Holland was not equivalent to *even* in Germany. The point was sustained, to Beethoven's great indignation, and the suit was transferred to the magistrates' court of the city, clearly the proper place, as Beethoven had been made a citizen of Vienna, some years before, as a mark of honor. The former decision was here reversed, and Beethoven was obliged to bring a new action. It was not until some time in the year 1821 that he obtained full possession of the boy. In the mean time the nephew had fallen into habits of indolence, falsehood, and extravagance beyond the power of his uncle to restrain or control. Johann van Beethoven, the composer's younger brother, was mean, sordid, and vain, and married to a woman who brought her illegitimate daughter to his house, and not seldom received her own lovers there. For such a man Beethoven could have little fraternal affection. The nephew became all in all to him. Upon him he lavished all the rich affections of his great heart. No pains nor expense was spared on the young man's education; but in vain. In August, 1826, the youth, then about 20 years of age, unable to pass the examinations of the school to which he belonged, filled up the measure of his ingratitude by shooting himself in the head. The wound was not fatal, and at length he recovered. By the laws of Austria, he was an offender against public morals and the church, and for some months was deprived of liberty. When at length restored to his uncle, it was with the order to leave Vienna in 24 hours. In his extremity Beethoven accepted the invitation of his brother to retire with Karl to Johann's estate some 80 miles above Vienna, on the Danube, until such time as a place in the army could be found for the young man. The place and the society of his brother's family soon became insupportable to the composer, and he determined to return to the capital. This journey of 2 days, in cold, wet weather, was too much for his feeble constitution, and he reached Vienna, Dec. 2, 1826, with his nephew, laboring under the effects of a very severe cold. A few days afterward a billiard marker of one of the coffee houses was taken to the hospital sick, where he informed Dr. Wawruch, clinical professor in the university, that Karl van Beethoven had requested him to send a physician to his sick uncle, and besought Dr. Wawruch to call. During the days that had elapsed, a violent inflammation of the lungs had set in, and the professor found Beethoven in a very bad condition. The inflammation subsided, but was succeeded by dropsy, under which the illustrious patient sank, and a quarter before 6 in the evening of March 26, 1827, in the midst of a sudden storm of rain, hail, and lightning, breathed his last. Notwithstanding the great expenses to which Beethoven

had been put, during most of his life, by ill health, and the sums which he had spent for his brothers and nephew, during the long-continued legal process mentioned above, he left property to the amount of about \$5,000, a fact which sufficiently refutes the common impression that he passed his life in abject poverty.—In the catalogue of Beethoven's works, we find hardly a branch of the art in which he had not wrought, but the preponderance of the instrumental over the vocal music is striking. For the full orchestra he has left us 9 symphonies, 11 overtures, the Egmont music, the battle of Vittoria, and some shorter pieces. Of chamber music the compositions—among them 16 grand quartets, and 4 trios for bowed instruments, from the grand concerto and septet down to the romanza and sonata—are very numerous. There are 32 grand sonatas for the piano-forte solo, and more than 100 other compositions, varying from the grand concerto to the variations upon a melody for that instrument alone or combined with others. Two masses, 1 sacred cantata, and a number of songs, belong to the branch of sacred music; an opera, and a vast variety of songs, trios, &c., fill up the catalogue of his vocal music. Beethoven's mission, if we may use the term, was to perfect instrumental music as the language of feeling and of the sentiments. Under Bach, Haydn, and Mozart, the sonata and the symphony had attained their complete development in form. Under Beethoven, a new soul was infused into them. Something had already been done in this direction. We perceive traces of it in Bach, and in Mozart. Clementi had written a sonata for piano-forte, entitled *Dido Abbandonata*, and Haydn, in quartet and symphony, was in the habit of imagining some story, the situations of which, in their corresponding emotions, he endeavored to depict. Beethoven went further. He not only painted character as no other master had done in music (see his overtures to Prometheus and Coriolanus), but made his music the medium of communicating the feelings which swelled his own breast. We feel this continually in his piano-forte sonatas, nor is the explanation of the fact difficult. The unremitting practice to which he was forced by his father during childhood, together with the course of instruction then in vogue, which aimed rather at making sound musicians, than masters of finger gymnastics, gave him that power over the piano-forte and the organ, without which no one can be said to have a mastery over those instruments. We speak of the mastery of style in an orator, when his thoughts, as they rise, clothe themselves at once in language forcible, appropriate, and elegant. So a complete mastery of the piano-forte and organ implies that the musical thought, as it rises in the composer's mind, suggests immediately the combinations and successions of notes which will express it, and the instantaneous dropping of the fingers upon the corresponding keys of the instrument. This

mastery Beethoven, in common with all the really great masters, had, and it was tempered even in his youth by such a knowledge of the principles of harmony, that his extemporaneous performances were as free from false harmonic relations, as the speaking of an accomplished orator from errors in the use of articulate speech. As he advanced in years his improvisations attracted more and more notice, and upon his arrival in Vienna, men who had known Mozart and fully appreciated his marvellous powers, confessed their astonishment at the force, vigor, and fire of the young Rhinelander when, giving his fancy the rein, his flying fingers interpreted the current of his musical thoughts. In his earliest published works will be found much of that pensive feeling which distinguished his extemporaneous efforts, and this quality in his sonatas became more marked as he advanced in years. Hence the marvellous fascination of his sonatas for every appreciative performer or hearer. They appeal to our hearts as the language of his own. They paint to us his moments of joy and of sorrow; of hope and of longings for that which is loftier and nobler—longings oft-times which can be uttered only in music. When writing for the orchestra the grandeur of his thoughts rose with the increase of means at his command, and he reached heights beyond all that composers before him or since have attained.—Justice has not usually been done to Beethoven on the score of intellect. His large head was in fact filled with a brain capable of intensely energetic and long-continued action. He was an insatiable reader, especially of history, and none followed with a deeper interest the rapidly changing scenes of that great political drama which began in his 19th year in Paris, and ended at the congress of Vienna in 1815. Born upon the Rhine, reared under the remarkably liberal institutions of the electorate of Cologne, and subjected to the direct influence of those ideas which set France in a blaze, he was early and for life a republican in his politics. He had not the education of a scholar, and the universal fact which obtains in regard to men of strong minds and great reflective powers, who have not enjoyed the advantages of high culture, obtains also in his case, viz.: a tendency to put full faith in conclusions founded upon insufficient data, and to consider their confessedly high authority upon subjects to which they have devoted themselves as a guarantee of the correctness of their views upon others. This argues not a want, but rather the possession, of a high degree of intellectual power. In whatever sphere of mental activity Beethoven had been placed, he would have been a man of mark. The exciting social, religious, and political topics, which agitated all Europe during the age of Beethoven, are familiarly known to all. Upon these topics he studied, pondered, reflected, and the aspirations, hopes, triumphs—the grief, woe, and despair of that age, found a place in his all-embracing sympathies. We perceive a tendency in his early

orchestral works, while still influenced in his style by Haydn and Mozart, in the direction which, as stated above, his piano-forte music followed—to become the medium through which the composer made known his feelings. But when, still in the prime of life, he found the sense most necessary to the musician forsaking him, and under this calamity he gradually withdrew himself from society, retaining a few old friends, but making comparatively few new ones, the tendency became more marked. As years passed on and old friends fell, he retired more and more within himself, trusting more fully to the impulses of his genius, uninfluenced by modes and fashions and popular styles; then it was that the rich stores of musical knowledge, acquired in his younger and happier days, were lavished upon works, the depths of whose thoughts, and the grandeur of whose designs, so far surpassed the appreciation of many of his contemporaries as to be condemned as the vagaries of a madman. As Gothic architecture is the artistic record of the aspirations of the ages during which it grew to perfection, so the orchestral works of Beethoven are the musical record of the great ideas of his time in the form and likeness which they assumed in his mind. Haydn and Mozart perfected instrumental music in its form—Beethoven touched it, and it became a living soul.

BEETLE, a very numerous and well-known order of insects, constituting the *coleoptera*. They have usually 4 wings: 2 membranous, the organs of flight, filmy and folded transversely; and 2, anterior and superior to these, of a harder consistence, protecting the former, and called *elytra*. They all have mandibles and jaws. The attention of naturalists has been specially called to this order, the most numerous among insects, from their singular forms, brilliant markings, size, and ease of preservation; so that their structure, habits, and transformations are very well ascertained. The head varies greatly both in size and form in the different tribes; it presents 2 *antennae*, of various forms, of which the joints are generally 11 in number; the eyes are 2, and compound; they have no simple eyes, according to Latreille. The mouth consists of a *labrum*; 2 mandibles, usually of a horny consistence; 2 jaws, each one having 1 or 2 *palpi*; and a *labium* of 2 pieces, accompanied by 2 *palpi*. The anterior segment of the *thorax*, or the corselet, which is in front of the wings, is larger than the other 2 segments, and is free in its movements; it supports only the first pair of legs; the other segments are united together, and nearly immovable; the *mesothorax* supports the second pair of legs and the *elytra*; the membranous wings and the third pair of legs are attached to the third and last segment. The *elytra* and wings originate from the lateral and upper portions of the segments; the former are of a firm consistence, almost crustaceous, and, in a state of rest, are applied horizontally one against the other along their internal edge;

they almost always conceal the true wings, and are generally as long as the body; in the act of flight they are usually extended, though in some species destitute of true wings they are united on the dorsal suture; in the wingless genera the *elytra* are always found. The abdomen is sessile, or united to the chest by its greatest breadth, composed of 6 or 7 rings, membranous above where it is protected by the *elytra*, and of a more horny consistence below. In the males the anterior pair of legs are often stronger, and the tarsi broader, than in the females. All the *coleoptera* masticate, and are accordingly provided with instruments proper for cutting and triturating their food; the salivary glands are quite rudimentary, and few in number; the digestive canal varies in length according to the habit of life, but it generally is much longer than the body. The sexes are separate, and the act of reproduction is a true sexual connection. The organs of respiration are *stigmata* along the sides of the body, and *tracheae* pervading all parts of the system. The abdomen encloses a fatty tissue, apparently connected with nutrition, which causes many of these insects to be eagerly sought for as food by the savage tribes of the old world. They undergo a complete metamorphosis; and the *larva*, or grubs, are generally soft bodied, and provided with 6 legs; it is in this state that they are so destructive to vegetation. The males perish soon after the sexual union, and the females die shortly after the eggs have been deposited.—The *coleoptera* have been variously divided by different authors; the divisions of Latreille, according to the number of the joints in the tarsi, have been generally adopted by naturalists. These divisions are the following: 1, *pentamera*, having 5 joints on each foot; 2, *heteromera*, having 5 joints to the anterior 2 pairs of feet, and 4 joints to the posterior pair; 3, *tetramera*, having 4 joints to all the feet; 4, *trimeri*, having no more than 3 joints to the feet. Though this system is artificial, and in many points very defective, it is still sufficient to give a clear idea of this very complex order. In the short space of this article little more can be done than to enumerate the families of the order, with very brief notices of some of the most remarkable.—Latreille makes 20 families, as follows. The *pentamera* include: 1. The *carnivora*, whose varied species all agree in being exceedingly voracious; they are both terrestrial and aquatic; the former have been divided into the tribes *cicindela* and *carabici*, the latter constitute the tribe *hydrocanthari*. The *cicindela* are very beautifully ornamented, of light and active forms, quick in their motions, darting on their insect prey, which they devour alive; they prefer light and sandy districts exposed to the sun; they are extensively distributed over the earth; the *larvae* are of a forbidding appearance and extremely voracious, seizing any insect which passes the openings of their subterranean holes. All the *carabici*, in the grub and perfect state, feed on living prey;

they emit a fetid liquid when pursued, and are for the most part agile runners; many have no true wings; they conceal themselves in the earth or under stones and the bark of trees. This is a very numerous tribe, and its study is difficult. Some of the most interesting genera are *carabus*, *scarites*, *harpalus*, *brachinus*, *feronia*, &c. The *hydrocanthari*, or swimming beetles, include the genera *dytiscus* and *gyrinus*; the feet are adapted for swimming, being compressed and ciliated; they live in the fresh lakes and marshes and quiet streams of all countries, and they pass their first and final stages in the water. The *dytiscs* can live on the land and also can fly; they vary in size from  $1\frac{1}{4}$  inch to  $\frac{1}{4}$  of an inch in length; they are carnivorous and voracious, and can remain a long time under water in pursuit of their prey; they swim on the surface with great rapidity. The *gyrini* are smaller, and may be found in troops on the surface of still waters, darting about with surprising agility; they can see in the water and in the air at the same time; they can fly well, though they swim better; the eggs are deposited on the leaves of aquatic plants. This family is useful in destroying noxious and predacious insects and grubs. 2. The *brachelytra* have but 1 palpus in the jaws, or 4 in all; the wing cases are shorter than the body, which is narrow and elongated; the head is large and flat, the mandibles strong, the antennae short; they live in moist earth, on dung and other excrementitious matters, and most of all in decaying animal carcasses; they are courageous and strong, running or flying with the greatest facility; they destroy insects with eagerness. This family is composed entirely of the old and vaguely determined Linnean genus, *staphylinus*. The larvae live in the same situations as the perfect insects. The family are very useful natural scavengers. 3. The *serricornes* have elytra covering the abdomen, and antennae equal throughout, dentated, saw-like or fan-like. Some of the most interesting genera are: *Buprestis*, many of whose species are very large, and exceedingly brilliant; these walk very slowly, but are excellent flyers; they are most numerous in warm climates, and live generally in wood. The genus *elater* is remarkable for the shortness of the legs, and for the faculty it has of changing from a supine position to its feet by springing into the air by means of a spine on its præsternum; the species are found in flowers, or plants, and on the ground; some of the American species, as the *E. noctilucus*, are phosphorescent, and are called fire-flies. The genus *lampyris*, also, is interesting, as containing the phosphorescent species whose females go by the name of glow-worms; the genus *telephorus* is noted as furnishing the species which are occasionally taken up by high winds, and deposited in distant regions, causing the so-called insect showers; the tick of the death-watch is produced by a species of *anobium*, living in decaying wood. The larvae sometimes

cause great destruction of valuable timber. 4. The *clavicornes* have the antennae thickened, or knob-shaped, at the end; they live chiefly on animal substances. The genus *hister* feeds on decaying and excrementitious matters. The genus *neorophorus* is noted for its habit of interring small animals, such as mice and moles, for the purpose of depositing its eggs in the decaying carcass; this they do by removing the earth beneath the body, which falls into the hollow; their sense of smell must be extremely acute. The genus *silpha* also prefers putrefying animal substances. The genera *dermestes* and *anthrenus*, in their larva state, are perfect pests to the naturalist, as they devour every animal substance accessible in his cabinet; the action of heat, usually employed to destroy them, is nearly as destructive as the insects. 5. The *palpicornes* resemble the preceding family in the shape of the antennae, composed of only 9 joints, and the feet in most of the genera are formed for swimming. The genus *hydrophilus* is carnivorous and voracious, frequenting fresh water and marshes, swimming well, but not so rapidly as *dytiscus*; their larvae destroy great numbers of aquatic insects and water-snails; they pass the nymph state in cavities in the earth, for about 8 weeks. Other genera are *elophorus* and *spharidium*; the latter is terrestrial. 6. The *lamellicornes* are the last family of the *pentamera*, including numerous genera, among which are some of the most brilliant and the largest of the order; those that feed on vegetable substances are beautifully colored, while dark tints prevail among those which devour decaying animal matters. The antennae are deeply inserted under the side of the head, short, ending in a knob, composed of plates or *lamina*. An idea of the form of the larvae, which are often very destructive to vegetation, may be formed from the well-known white-worm, the larva of the *melolontha*. In this family are included the genus *scarabæus* of Linnaeus, proper to warm climates, particularly Africa; they live in ordure of all kinds; the *atouchus sacer*, an object of religious veneration among the ancient Egyptians, and often represented on their monuments, and found in the sarcophagi, belongs to this genus; other genera are *copris*, *geotrupes*, *trox*, *melolontha*, *cetonis*, and *lucanus* (stag beetle). While many of the melolonthians are destructive, the *geotrupida* and *scarabæida* are useful in removing carrion and filth.—The *heteromera*, the 2d section of the order, are all vegetable feeders; many of them avoid the light; it includes: 7. The family *melasoma*, of black or ash-colored species, for the most part apterous, with the elytra as it were soldered together; some of them have a salivary apparatus; they dwell on the ground, under stones, and in dark situations in houses, quitting their retreats at night; they are slow in their movements. Among the genera are *pimelia*, *blaps*, and *tenebrio* (meal-worms). They and their larvae are useful scavengers. 8. The *taxicornes* have no corneous tooth on the inner side

of the jaws; all are winged, and the legs are not adapted for running; in the males the head is sometimes furnished with horns. Most live on tree fungi or under the bark, or under stones on the ground. Some of the genera are *diaperis*, *phaleria*, and *eledona*. These fungus-eaters are useful to man. 9. The *stenelytra* differ from the preceding chiefly in the antennæ; they are quite active, concealing themselves under the bark or among the leaves and flowers of trees; some live in fungi, others in old wood. To this belong the genera *helops*, *cistela*, *dircaea*, *adomera*, and others serviceable to man. 10. The *tracheleides* live on plants, of which they devour the leaves and suck the juices. Here belong the genera *lagria*, *pyrochroa*, *mordella*, *notatus*, *horia*, *meloe*, *cantharis*, &c.; the *C. vesicatoria*, or Spanish fly, is well known in medicine for its blistering properties.—The third section, the *tetramera*, are vegetable feeders; they include: 11. The *rhynchophora*, a large and richly ornamented family, living very often in the interior of fruit and seeds, and very destructive to the products of the farm and the orchard; it is easily recognized by its projecting muzzle. Among the genera are *bruchus*, whose larvæ are very destructive; *attelabus*, *brentus*; *curculio*, the greatest pest of the horticulturist; *calandra*, one of whose species, the weevil, destroys immense quantities of grains; the larvæ of the *C. palmarum*, on the other hand, are considered a great dainty by the West Indian blacks. 12. The *xylophagi*, in the larva state, destroy or render useless great numbers of forest trees by the channels which they gnaw in various directions; among the most destructive is the genus *ecolytus*; other genera are *bostrichus* and *trogosita*. 13. The *platysoma* are found beneath the bark of trees; the principal genus is *cucujus*. 14. The *longicornes* have filiform and very long antennæ; their larvæ live in the interior or beneath the bark of trees, where they are very destructive. Some of the species are among the largest of the order. Among the genera are *parandra*, *cerambyx*, *callidium*, *lamia*, *saperda*, and *leptura*. 15. The *eupoda* derive their name from the large size of the posterior thighs in many species; they are all winged, and occur on the stems and leaves of plants, especially the *liliaceæ*; among the genera are *sagra*, *crioceris*, and *donacia*. 16. The *cyclica* are small, slow in their movements, but often brilliantly colored; the females are very prolific. Here are placed the genera *hispa*, *cassida*, *cryptoccephalus*, *chrysomela*; *eumolpus*, one species of which, *E. vitis*, in its larva state, commits great ravages in wine countries; *galeruca* and *altica*, possessed of great jumping powers; the latter is often very destructive to the turnip crops. 17. The *clavipalpi* are all gnawers, and may be distinguished by their antennæ ending in a knob, and by an internal tooth to the jaws; the body is usually rounded. Some of the genera are *erolytus*, *triplax*, *agathidium*, and *phalaecrus*.—The last section, the *trimera*,

have the antennæ ending in a compressed club formed by the last 8 of the 11 joints; it contains: 18. The *fungicola*, living chiefly in fungi and dead wood; the principal genus is *eumorphus*. 19. The *aphidiphagi* are best represented by the genus *coccinella*, or lady-bird; these pretty little beetles, more especially in the larva state, live almost entirely on *aphides*, or plant-lice, and in this way are of immense service. 20. The *pselaphii* have short truncated elytra; the species are generally very small, and live on the ground in moist places, and under stones and moss; the types of this, the last family, are the genera *pselaphus* and *claviger*.—The coleoptera are exceedingly numerous in species. It is by the occurrence of *elytra* that this order may be at once recognized; these organs are highly ornamented, and they serve not only to protect the membranous wings, but to shield the body in the dark and dangerous places in which beetles delight to go; and by their broad expanded surfaces they assist the heavy species in their flight, acting both as a sail and a parachute.

BEFANA, in Italy the name of a puppet or doll dressed as a woman, and carried through the streets in procession on the day of Epiphany, and on some other feast days. The name is probably derived from *Epifania*, the feast of the Epiphany. On the day of this feast presents are given to children in Italy, as they are in America on Christmas or New Year's, and the *befana* is supposed to bring them.

BEG, BEX, BEGEBEG, titles of honor among the Turks. The term beg means "lord;" the beglerbeg is "the lord of the lords." The beg is, in some parts of the empire, inferior to a pasha, holding a town or district subject to the supervision of the pasha. In the African provinces, the bey is the supreme officer of Tunis and Tripoli, and was the chief title among the Mamelukes.

BEGA, a river of Eastern Hungary. It joins the Theiss 21 miles east of Peterwardein, and forms a part of the Bega canal, extending from Facset to Beeskerek, a distance of 86 miles.

BEGA, CORNELIUS, a Dutch painter, born at Haarlem in 1620, died Aug. 16, 1664. He was a pupil of Ostade, whose manner he imitated. The subjects of his paintings are commonly the amusements of the Dutch peasantry, and the interior of cottages and taverns. When the plague in 1664 visited Holland, a young lady, whom he loved, was attacked by it, and abandoned by her friends. Bega remained by her side, rendering her every attention till her last moment. He, however, caught the fatal infection, and died of it.

BEGAS, KARL, a Prussian painter, professor, and member of the Berlin academy of fine arts, born April 30, 1794, at Heinsberg, near Aix la Chapelle, died in Berlin, Nov. 23, 1854. He studied first under Philippart, and in Paris under Gros. His first work, a copy of the Madonna della Sedia, attracted the attention of the king of Prussia, who appointed him painter

of the Prussian court. His productions comprise historical, genre, and portrait paintings, of which the most important are "Henry IV. at the Castle of Canossa," the "Sermon on the Mount," "Christ on the Mount of Olives," the *Lorelei*, the portraits of Humboldt, Schelling, Ritter, Rauch, Cornelius, and Meyerhper.

BEGGARY. See PAUPERISM.

BEGHARMI, or BAGHEEMEH, a country of central Africa, S. of the great Saharan region, and between the country of Waday on the east and that of Bornoo on the west. It extends as far as Lake Tchad, and with a south-easterly trend from that point, having for its western boundary the river Shary, it reaches to about lat. 8° 30' N. It is an irregular valley or basin formed by the slopes which feed the Shary and its tributaries. The inhabitants are probably a branch of the Gallas, who have overrun Begharmi as they have Abyssinia. Dr. Barth visited Begharmi in 1852, and to him we are indebted for what we know of it. The horses are said to be of the finest breed. The inhabitants are warlike, and often make predatory incursions upon their neighbors. They are possessed of considerable military skill, and are muscular and well formed. They are idolaters, so far as they have any religion. The capital of Begharmi is Mesna.

BEGHRAM, a plain in Afghanistan, and also the name of an ancient city of that country. Various relics, such as coins, rings, &c., have been discovered, but efforts to ascertain the precise site of the city of Beghram have hitherto been unsuccessful.

BEGKOS, a village of Asia Minor. It is situated on a bay of the same name in the Bosphorus. In ancient Greek mythology, Begkos is known as the scene of the contest between Pollux and Amycus.

BEGSHEHER, BEGSHKHR, or BEYSHEHER, a lake, river, and town in Asia Minor, Carmania. The lake, which is 20 miles long and from 5 to 10 miles broad, is supposed to be the one anciently known by the name of Lake Coralis, or Karajeli. It contains a number of islands. The Begsheher river serves to discharge the waters of this lake into Lake Soglah. Its length is about 25 miles. On the banks of this river stands the town of the same name. It is built on both sides of the stream, the opposite quarters being connected by a stone bridge of 7 arches.

BEGUARDS. See BEGUINS.

BEGUINS, an order of Christians, who have received as many names as there have been opinions concerning their origin and character. They are called Bizochi and Bocasoti in Italy, and Beguards and Beghards in Germany, while by many they are confounded with the Beguines of Germany and Belgium, and with the Lollards who came after the Beguins, and sprung from them. The origin of the Beguins is historically dependent on that of the Beguines. The order of Beguines was founded by St. Francis of Assisi, who, after he had established the

order of Franciscan monks, perceived the necessity of providing for females, as well as for males, some specific mode of expression to the spirit of asceticism which had so greatly increased on the breaking out of the crusades (A. D. 1094). For those men who wished to devote themselves to the church, the priesthood offered itself, while the expeditions against the infidels in the possession of Jerusalem afforded ample vent for the zeal of the laymen. St. Francis instituted the order of Beguines (1206 or 1220) to meet the want which had begun to be felt by women who were unable to take the veil, and so devote themselves to a life of seclusion from society, beyond a limited time and degree, and who could not follow the armies of the crusaders into Palestine, as some of their sisters had done. But the fire of the crusades had begun to wane. The death of the emperor Henry VI., who had prosecuted the 4th crusade (1195), and the disastrous termination of the 5th (1198) on account of the plague, had cooled the ardor of the laymen for that kind of service. Since in the institution of the order of Beguines the way had been opened for societies and combinations among the laity, men began now to follow the example which had been set them by the other sex. St. Francis instituted the third rule, or order of Tertiaries, for such men as wished, without becoming ecclesiastics, to give themselves to a more ascetic mode of living than the circles of business or social life admitted of. The society of Tertiaries was a society which kept alive and gave expression to the ascetic spirit which was so rapidly increasing among the masses. It was the rule of this order to subsist entirely upon the charities of those to whom they appealed. From this circumstance they were designated by the epithet Beguards, Beguins, or Beghards in Germany, from the German *beggen*. Probably the epithet Beguines, as applied to the second order of St. Francis, the laywomen, was indicative of the same mendicant character, or as some writers say, it was meant to designate them as the "praying sisters." Neither of these names, however, was given at the time the orders were founded. The Beguines were at first called the *ordo dominarum pauperum*, and later, the order of St. Clara, while the Beghards were originally known as the *fratres penitentia*. Mosheim does not altogether agree with this history of the origin of the Beguines, for he says, in reference to the great debate which arose in the 17th century in the Netherlands concerning the origin of the Beguines, that the Beguines proved themselves by 3 historical documents to have as great an antiquity as about the middle of the 11th century, which would throw them back 150 years before the time of Francis of Assisi. The Beguines of the 11th century were probably, however, not known as Beguines at the time, for they were not originally mendicants; or even if they were thus known, since the title is only a nickname, they might not have had any relationship with the Beguines of the 17th or the

18th century.\* Of one thing we are certain, that the epithet of Beghards or Beguines was bestowed in after time upon numerous sects and orders, which had nevertheless each a different chronological, and many of them a widely differing philosophical origin. The Beguins and Beguines of St. Francis, for so we may designate them in distinction from all others, were an outgrowth of the crusades, and cannot be understood if contemplated separately from these great features of ecclesiastical history. The Beguines differed from the nuns who took the veil, in that they still had control over their own property, and never were regarded at any stage of their career as having pledged themselves, without return or repentance, to a life of seclusion. They might, indeed, be the mothers of families, and many of them were the widows of those who had perished in the crusades. The same general principle characterized the Beguins or Beghards. They were in many instances the heads of families, while the real monks were required to abstain from marriage. Thus the orders of the Beguines and Beguins were instituted by St. Francis as a kind of middle rank between the priesthood and the laity, and were the result of a practical insight on his part into the wants which the spirit of the crusades had begotten. These sects or orders were both of them characterized by simple and temperate habits, nor do they ever appear to have been guilty of great personal offences. They were, however, destined to persecution. Unconnected with the church ecclesiastically, the powers of the church were not always engaged to protect them. Having become suspected of some heresies in doctrine, on account of a division in their ranks into practicals or orthodox and mystics, the mystic branch of the Beguines seem to have allied themselves with an order of the laity which had come to be known as the Brethren of the Free Spirit, and so exposed themselves to the censure of the church, which, in 1311, passed the famous act of the council of Vienna, known as the Clementine, the persecutions justified by which nearly ruined the mystic Beguines, and seriously injured both the orthodox sisterhood, and their brethren the Beguins. The Beguines of Holland seem to have avoided the suspicion of heresy, and were therefore less molested. But after 1250 the term Beghard was mainly synonymous with heretic in the ecclesiastical vocabulary. The more orthodox portion of the order joined by degrees either the Franciscans or the Dominicans, and wandered on the banks of the Rhine, crying piteously "Bread for God's sake." From 1311 to 1318, the Beguins were persecuted in Germany with too little regard to the division above mentioned, and to 1326 in Italy, at which several dates John XXII. took the orthodox branch of them under protection. After 1374, the Beghards are mostly merged in the Lollards. There are still Beguinagia, or establishments of the Beguines, in many cities of Belgium and Holland. There is one in

Brussels containing 1,000 inmates, who are governed by matrons.

BEGUM, in the East Indies, a title of honor bestowed upon princesses, and also upon the sultanas of seraglios. Two wealthy begums of Oude, in Hindostan, the wife and mother of Sujah Dowlah, are celebrated for the cruelties which they suffered from Warren Hastings. That resolute governor having looked in vain elsewhere for the treasures which he required, determined to extort it from these princesses. To this end their confidential servants were arrested and tortured, their zenanas or dwellings were surrounded by troops, and the treasure being still withheld, their apartments—sanctuaries respected in the east by governments which respect nothing else—were burst open by gangs of bailiffs. For the face of an eastern lady to be seen by strange men is an intolerable outrage, and to avoid so terrible an exposure the begums surrendered to the governor immense sums. Yet the cruelties did not cease, but many of the women and children were flung into gaol, distressed by torture or want of food, or driven to the extremity more dreaded than death of appearing publicly before the sepoya. Begums are generally of noble birth, and heirs to at least a portion of the wealth which they possess. Not unfrequently, however, they are quick-witted provincial girls, whose first successes were due to their beauty, and who after an adventurous career find themselves the survivors and heirs of their various husbands. Thus in the present century the famous begum Sumroo, who swayed the territory of Sirdhana, and whose annual revenue was £250,000, was by birth a Cashmerian, and by family a Georgian. At first a dancing girl, her lustrous eyes charmed a French officer, who with more enterprise than principle, served on all sides in the Indian wars, till by the last of his 8 masters he was rewarded with the territory of Sirdhana for his valuable services. The Cashmerian girl, whose maiden name was Zeb-al-Niassa (the ornament of the sex), accompanied this officer in his various expeditions, and was at length successful in alluring him into a marriage. Wearied at length of her lord and master, and exasperated at discovering that she was not the sole object of his love, she with cool perfidy beguiled him to his death in a well-varnished but horrible plot. Having seen his dead body she returned to her tent, buried alive the poor slave girl who had been the object of her husband's passion, and placing her bed over the grave, slept there until morning, lest any one more compassionate than herself should lend a saving hand to the victim. She now owned and ruled an immense estate till her death in 1886, at 90 years of age, living in splendor at her houses and gardens in Merat and Delhi, entertaining guests in the most magnificent style, admired even by the British for her taste and wit, though she usually sat in the cross-legged fashion, and seeming to exist principally upon tea and the smoke of tobacco, and to keep death at arm's length rather by the energy of

her mind than by any strength of the flesh. Eminent among the begums of India was Nour Jehan (the light of the world), the favorite wife of the emperor Shah Jehan, reputed to have been the most beautiful and accomplished woman of her age in Asia, and in reverence for whose illustrious beauty, virtues, and accomplishments, and to immortalize her name, that prince erected over her remains the magnificent mausoleum of Tajh Mahal, at Agra, one of the most superb specimens of architecture in the Orient. In its centre is a block of marble recording the name and graces of the begum, and extravagantly inlaid and bedecked with gems. The begum and light of the harem Nourmahal in the poem of Lalla Rookh, is well known, and Mr. Thackeray in his novel of the "Newcomes," makes a begum, or wealthy widow returned from India, figure in English society.

BEHAIM, or BEHEM, MARTIN, a German navigator and geographer, born at Nuremberg about 1459, died at Lisbon, July 29, 1506. After having at an early age pursued astronomical and mathematical studies, he went, in 1477, to Flanders, where, at Mecheln and at Antwerp, he engaged in manufacturing and selling cloths. The active commerce between Flanders and Portugal, and also the interest which he took in the great maritime undertakings of the Portuguese at this time, induced him, in 1480, to visit Lisbon, where he was well received at the court of King John II., and became a pupil of the learned John Müller, celebrated under the name of Regiomontanus. Here he was associated with Columbus, whose views of a western passage to India he is said by Herrera to have supported. In 1488 he was appointed a member of the commission for calculating an astrolabe and tables of declension; and in reward for his services, was made a knight of the order of Christ. In the following year he was cosmographer in the expedition of Diego Cam, who sailed along the western coast of Africa as far south as the mouth of the Congo. In 1486 he sailed to Fayal, one of the Azores, where he established a Flemish colony, and married the daughter of its governor. Here he remained till 1490, when he returned to Nuremberg, where he constructed a terrestrial globe, on which historical notices were written, and which is a valuable memorial of the discoveries and geographical knowledge of his time. Behaim subsequently returned to Fayal, and was, for a time, employed in diplomacy by the Portuguese government. It has been maintained, by some writers, that he visited America before Columbus; and an island which he places upon his globe far to the west of the Azores, has been thought to be evidence of this. But the existence of an island somewhere in the western waters was one of the current beliefs of the time, and it is probable that Behaim had no positive evidence in assigning it a locality.

BEHAM, HANS SEBALD, a painter and engraver, born at Nuremberg in 1500, died at

Frankfort in 1550, as notorious for his profligacy as he was eminent for his abilities as an artist. Bartsch enumerates 430 of his prints, of which 171 are wood-cuts. He excelled principally as an engraver upon copper, and in small prints, which are much in the style of those of Aldegrever.

BEHEADING, a mode of execution said to have been first employed by the Persians. According to Xenophon, it was looked upon in Greece as the least degrading capital punishment; and this classic theory of beheading was adopted by the British nobility, whose heads are cut off, while commoners are consigned to the less aristocratic gallows. St. John's head was cut off under the Roman régime in Judea. Caligula was a great amateur of executions, and employed a soldier, an eminent artist in the profession of beheading, who brought prisoners indiscriminately from their dungeons, in order to exercise his art upon their heads for the special delight of his imperial master. In the early ages, the blow was given with an axe; but as chivalry and good taste advanced, the sword was substituted, which remains to the present day a favorite instrument of beheading, as, for instance, in Bavaria, and some other parts of Germany. The Roman beheading, or *decollatio*, was a popular military punishment. The earl Waltheof was the first Englishman beheaded, by order of William the Conqueror, in 1075. In some English counties, beheading was not confined to the nobility; and under Edward II., it was customary in Cheshire to behead every common felon. The murderous instrument which, in the 18th century, cut off the heads of Italian noblemen, was called *mannaia*. In 1268, Conrad of Swabia was beheaded at Naples with a Welsh trap, or *Welshes Falle*, as the Germans call it. The instrument used for the first time in Germany in Zittau, in 1300, was called *dolabra*, which caused death by driving the instrument through the neck. In Scotch antiquity, the edged instrument used for beheading was called the maiden, introduced into England by the regent Morton, who became a victim of his own invention, as Dr. Guillotin was subsequently, in France, of his. The Duke of Montmorency was beheaded at Toulon in 1632. In the 18th century, the Dutch beheaded the convicted slaves in their colonies. The Scotch maiden does not differ much from the guillotine, and chops off the head in descending, with the exception that the oblique descent of the guillotine causes a more instantaneous death. In France, beheading was formerly confined to the nobility; but since the invention of the guillotine, it is the only mode of capital punishment.

BEHEMOTH, the beast described in the book of Job (xl. 15-24). There has been much variety of opinion as to what species of animal is referred to under this appellation. The elephant, the ox, and the crocodile have been suggested. The christian fathers variously supposed it to be a figurative representation of the devil, Antichrist, Sennacherib, and Pharaoh.

Dr. Adam Clarke believed it to be the mastodon, a kind of monster, whose prior existence on the earth is certified by huge fossil remains that have been discovered. Bochart, in a learned treatise, maintained that it was the hippopotamus, and this opinion has been adopted by most recent commentators. The rabbins teach that the behemoth is one of 2 marvellous ox-like animals, male and female, created by God at the beginning of the world. They add that the female has long been slain, and the flesh is preserved for a banquet to the faithful Israelites on the morn of the resurrection. The male still lives, and eats daily the foliage of 1,000 mountains, which grows again by night. He, too, will be slain to furnish a feast to the Messiah at his appearance.

BEHN, APHARA, or APHRA, a lady distinguished for her wit, beauty, and writings, in the reign of Charles II., born at Canterbury about 1640, died at London, April 16, 1689. She was very young when she sailed with her father, whose name was Johnson, for the province of Surinam, in South America, of which he was appointed lieutenant-general. Her father died on the passage, but the voyage being continued she resided for some time in Surinam, where she became intimately acquainted with the native prince Oroonoko, whom she admired as a type of heroism, and whose adventures and unhappy fate became the theme of one of her own novels, and of a tragedy by her friend Southern. Soon after her return to England she married Mr. Behn, a London merchant of Dutch extraction, and was introduced to Charles II., whom she delighted by her free and lively manners, and her entertaining account of the colony of Surinam. This monarch selected her as a political spy to collect intelligence and manage affairs for him on the continent during the Dutch war. She, therefore, took up her residence at Antwerp, and attracted numerous lovers and admirers, whom she managed so well that in 1666 she detected the project formed by Admirals De Witt and De Ruyter of burning the English ships in the Thames. She at once transmitted the intelligence to England, but the court of Charles refused to believe the fair envoy, though her report was speedily proved true by the event. Mortified that her skilful labors should have been so ill appreciated, she renounced politics, and revelled in the amusements of Antwerp. Embarking soon for England, she narrowly escaped death, being saved in a boat after the vessel had foundered, and from this time she devoted herself to authorship and to the gayest society of the capital. Her comely manners, brilliant eye, passionate character, and conversational talent, made her the delight of such men of wit and pleasure as Rochester, Etheridge, Southern, Crisp, and even of Dryden; and her works, consisting of 17 plays, some little novels, a variety of short poems, and numerous letters, of which those between a "Nobleman and his Sister-in-Law" (Lady Henrietta Berkeley and

Lord Grey) were the most famous, are remarkable for their grace and sprightliness, their lack of moral principle, and their entirely unbounded license. She wrote under the signature of "Astræa," and Pope alludes to her by that name. She died after a lingering sickness, and was buried in Westminster Abbey.

BEHR, WILHELM JOSEF, a German publicist, born at Sultzheim, Aug. 26, 1775, died at Bamberg, Aug. 1, 1851. He was professor of law at Würzburg, from 1799 to 1821, and became burgo-master there. In 1819 he represented the university at the Bavarian diet, and was a conspicuous member of the opposition. When he was chosen a second time to represent Würzburg, in 1831, the royal approbation was not granted him. This created great disturbance, and Behr himself having taken advantage of an opportunity to express his ideas, at Gaibach, May 27, 1832, an investigation was ordered, and Behr was dismissed from office. In 1836 he was condemned to imprisonment at Passau; but in 1839 was released, but kept under supervision of the police, and not until 1848 was he restored to full liberty. In 1848 he was elected to the Frankfort parliament.

BEHRING, or BEERING, VITUS, an arctic navigator, born in 1680, at Horens, Jutland, died Dec. 8, 1741. In his youth he made several voyages, in a subordinate capacity, to the East and West Indies. Peter the Great early enlisted his services for Russia. During the Swedish wars, he served in the Cronstadt fleet. He was made lieutenant in 1707, captain-lieutenant in 1710, captain some few years later; and captain commander in 1732. He previously made, in 1725, an expedition to the northern seas, to discover an overland passage to America. Having discovered, in 1728, what he considered to be the northeastern headland of the Asiatic continent, he returned the same year to his winter quarters, from which he made another expedition in the spring, the result of which was the discovery that Kamtschatka did not connect with Japan, according to the usual belief. In 1741 he took charge of an expedition with larger outfit, for purposes of general discovery. His first attempt was in the north. Soon, however, he was ordered by the government eastward, in which direction he proceeded for 44 days, making, from Avatcha, 50° of longitude, when he descried high mountains, which proved to be on the American side of the straits which now bear his name. Coasting for some time, probably on that part of the shore now called New Norfolk, the sickness of his crew compelled him to return. But on the island which bears his name, his vessel was wrecked, and he himself died there 85 days thereafter. His crew escaped in a boat constructed from the remains of the wreck.

BEHRING'S ISLAND. This island, named from its discoverer, Vitus Behring, lies off the east coast of the peninsula of Kamtschatka, nearly 2° distant from the cape. It is about 90 miles

long. It was uninhabited at the time of its discovery (1741), but has since been occupied by fur traders, and is a winter harbor for the trading vessels. The island is destitute of wood, and its soil is exceedingly barren. It abounds in springs of fresh water, and the furs of the arctic animals found here are very valuable, the principal of which are the ice-fox and sea-otter.—**BEHRING'S SEA**, that part of the Pacific ocean which lies immediately south of Behring straits, and between the continents of America and Asia. Its southern limit is the curvilinear line of islands, which, in connection with Behring's island, stretches quite across the Pacific from Alaska to Kamtchatka. It receives the Anadyr river in a gulf of the same name on the Asiatic side, has several islands, and is almost perpetually covered with fog. The current sets north through the strait. This sea is not so much obstructed with ice as Baffin's bay. It was first explored by Behring, in 1728.—**BEHRING'S STRAITS**. These straits connect the north Pacific and the Arctic oceans, and lie between the continents of Asia and America. Between East cape in Asia, and Cape Prince of Wales on the American side, the straits are only 36 miles wide. The depth of the straits is from 20 to 30 fathoms. They are commonly reckoned about 400 miles long. They were discovered by Vitus Behring in 1728, and from him take their name. Capt. Cook visited and described them in 1778, and later Capt. Beechey. About midway across, in the narrowest place, are 8 islands, called Diomedes. Opposite the southern opening of the straits stands the large island of St. Lawrence. A current sets through the straits from south to north. The adjacent coasts are uninhabited. The shores are bluff and deeply indented. The straits are frozen over every winter, and large quantities of ice are constantly blocked in north of the capes.

**BEILAN**, a town and pass of Syria, at its northern extremity, on the E. side of the gulf of Iskanderoon. The pass, between the mountains Rhossus and Amanus, is identical with the Amanian gates of antiquity. The town, which overlooks the pass, has some stone houses and several aqueducts. Here the Egyptians defeated the Turkish troops in 1832. Pop. 5,000.

**BEIRA**, or **BEYRA**, a central province of Portugal, between lat. 39° 30' and 41° 30' N., and long. 6° 40' and 9° 50' W.; bounded N. by Minho and Tras-os-Montes, E. by Spain, S. by Estremadura and Alentejo, and W. by the Atlantic; pop. in 1854, 1,155,275. The surface is very mountainous; the soil not fertile, but produces barley, wine, wheat, maize, olives, and fruits. The mountains furnish fine pasturage for sheep, and yield iron, marble, and coal. The province is divided into upper Beira, capital Viseu, and lower Beira, capital Castello Branco.

**BEISAN** (anciently called **BETHSHAN** and **SCYTHOPOLIS**), a village of Palestine, situated near the Jordan and about 55 miles north of

Jerusalem. It consists of 60 or 70 houses, and contains traces of the ancient city—the remains of walls on an acropolis, a Roman bridge, fragments of columns, ruins of houses, tombs, a theatre, &c.

**BEIT**, an Arabic word for house, often used as a name of a place, and corresponds to the Hebrew *beth*. Thus *Beit-al-haram* is "the edifice of the sanctuary," and is applied to the temple at Mecca. The village of Bethlehem is in Arabic *Beit-al-Lahm*, that is, the "house of bread."

**BEIT-EL-FAKIH** (house of a saint), an Arabian port on the Red sea. It is a large town with a population of about 8,000, and contains a mosque and a strong citadel. The houses are built of brick and clay, and roofed with date leaves. Caravans from all parts of Arabia, Syria, Persia, and Egypt, resort hither with Indian and British goods, spices and sugar, receiving in exchange coffee, wax, and various gums. Much of the commercial importance of the place is owing to an annual festival of 3 days which is held at the tomb of a sheik near by.

**BEIT-EL-MA**, a village in the pashalic of Aleppo, in Syria. It is supposed to occupy a portion of the site of ancient Daphne, and contains, beside some classic remains, the ruins of an early Christian church.

**BEJA**, a fertile district of Portugal, in the province of Alentejo; pop. in 1854, 124,890. It is extraordinarily rich in cereal productions, and the plain surrounding the city of the same name, is said to produce more than a million bushels of wheat annually, beside oil, wine, and fruit. Pop. of the city 6,000.

**BEJA**, or **BOJA**, a race of Africans to the north of Abyssinia, near the harbor of Suakim. The Arabs traded all along this coast, and seem to have intermarried with the Bejas, who were once of some importance, and joined in the wars of their northern neighbors. They are mentioned on the obelisk of Axum as the *Bougaeita*.

**BEJAPOOR**, or **VIZIAPPOOR**, a city and former province of Hindostan, in the great territorial division called the Deccan; bounded N. by Aurungabad, E. by that province and Beeder, S. by Canara, W. by the Indian ocean. It contains about 60,000 square miles. The city is situated in lat. 16° 48' N., long. 75° 46' E. It was once of great size, and, according to the tradition of the natives, the largest city of the East. It was a fortress defended by outworks of great extent. Among the artillery with which the walls were mounted were guns of huge dimensions, 2 of which came into the English possession, one said to be capable of carrying a ball weighing 2,646 lbs. The modern city retains few traces of its former grandeur. There is a street 3 miles in length, several nunneries, and a Bramin temple of unknown antiquity. The province was formerly under Mahratta government, and, in 1818, the British took possession of it, expelling the Peishwa

Bajee Rao, the prime minister and ruler of the province. The dominions of the present Rajah of Sattara are part of the original province, held by him under the provisions of a treaty with the East India company, by which he is to govern it in such manner as not to conflict with the British interests, he, on his part, being secured in his government.

BEKE, CHARLES TILSTONE, an English Abyssinian traveller, born October 10, 1800, in London. He quitted commerce to study law, and then devoted himself to historical, philological, and ethnographical investigations, and published *Origines Biblica*, or "Researches in Primeval History" (Lond. 1834). He next became impressed with the importance of Abyssinia in the history of civilization, and made propositions to the British government and several scientific institutions concerning its exploration. These offers were not accepted, but private individuals took the matter up, and he went out in the Abyssinian expedition, headed by Major Harris. He explored Godshem and the lands south. The results of his discoveries have been published in series, in the "Journal of the Geographical Society," London, and in a work of his own, entitled "Abyssinia" (Lond. 1846).

BEKES, or BEKESVAR, a Hungarian town, situated at the confluence of the White and Black Körös, in the county of the same name. It was formerly a fortified place, and the remains of an ancient castle are still to be seen in its vicinity. Bekes has considerable trade in cattle, corn, and honey. In 1854, the population of the town was 17,260, and of the county, 155,000.

BEKK, JOHANN BAPTIST, a statesman of Baden, born Oct. 29, 1797, at Tryberg, in the Black Forest, died at Bruchsal, March 22, 1855. He was a lawyer, entered the 2d chamber of Baden in 1831, was its president from 1842 to 1845, and, in 1846, was made prime minister. In the revolution of 1848, he was too moderate for one party and too liberal for the other, and went into retirement. In March, 1850, however, he again became president of the Baden chamber, and after his death a monument was erected to his memory at Bruchsal.

BEKKER, ELIZABETH, an elegant Dutch writer, was born in Flushing, July 24, 1738, and died at the Hague, Nov. 25, 1804. Many of her works are esteemed among the Dutch classics, especially her romance *Historie van Wilhelm Leewend*. In some of her more important works she was aided by her friend Agatha Deken, who died just 9 days after her.

BEKKER, IMMANUEL, a German philologist, was born in 1785 at Berlin, and was a pupil of the celebrated Wolf at Halle, by whom he was designated as the only person able to continue the researches he had begun. When the university at Berlin was established, he went thither, and passed 2 years in examining the manuscripts in the library. In 1815 he was made a member of the academy of sciences, and, in 1817, was sent to pursue his researches

in Rome and the Italian convents. He went, in 1820, to Oxford and Cambridge, and subsequently published his magnificent edition of all the Attic orators, with the works of Photius and some of the Greek grammarians. He also published the works of many of the Alexandrine historians, among them those of the princess Anna Comnena, and several volumes of Scholia on the Iliad and Aristotle, notes on Tacitus, and other classical works.

BEL, MATYAS, a Hungarian historian, born at Orsova in 1684, and died in 1749. He was distinguished as a theologian and historian, and became rector of the Protestant schools at Neusohl. He wrote on the history of Hungary alone, and achieved much distinction. His writings are valuable even now.

BELA, BELAH, BEILA, or BEYLAH, capital of the province of Loos, or Lus, in Beloochistan. It contains the fortified palace of the chief of the province, and a mosque, but has no other substantial buildings. There are about 800 houses, of mud; pop. about 5,000.

BELA, the name of several Hungarian kings of the lineage of Arpad.—BELA I., son of Ladislas, reigned in the 11th century; was twice obliged to escape to Poland, on account of domestic dissensions occasioned by his brothers. In 1061, he returned, supported partly by Poles, partly by Magyars, and succeeded in seizing the throne. He energetically subdued the remains of paganism and strengthened the royal power, but his reign, lasting only 2 years, was too short to carry out all the reforms which Magyar annalists ascribe to him.—BELA II., a drunkard, reigned 10 years, from 1181 to 1141. In his youth he was blinded by his own uncle.—BELA III. reigned in the last quarter of the 12th century, and died in 1196. He warred successfully against the Poles, Austrians, and Venetians, and reconquered from the latter some cities in Dalmatia. He was married to a sister of Philip Augustus, king of France.—BELA IV. reigned for 35 years, from 1235 to 1270. He was crowned in childhood, and was son of Andras II., who gave to the nobility the golden bull or charter, establishing their privileges. The greater part of his reign was stormy; the nobility rose and obliged him to fly to Austria, and thus external and internal war devastated Hungary, which was then likewise invaded by the Tartars, in pursuit of the Polowzy and the Kumans, admitted into Hungary by Bela. Their descendants are found in Central Hungary. He finally overpowered his enemies, was victorious over Frederic II., archduke of Austria, who behaved treacherously toward him during his misfortunes, and succeeded in curbing the encroachments of the clergy. His last days were embittered by the revolt against him of his own son Stephan.

BELABRE, a town in the department of the Indre, France. The sieur de Flavi, whose order to close the gates of Compiègne led to the capture of Joan of Arc, was strangled in

the old castle there. Pop. of the commune in 1856, 2,217.

**BELAIA**, or **BIELAJA**, a Russian river rises in the Ural mountains, in the government of Orenburg, flows S. E. for 100 miles, then N. 100 miles; then turns N. E. and joins the Kama river. Its entire length is 550 miles; navigable about 240.

**BELASPOOR**, capital of the rajahship of Cahlora, north Hindostan, situated on the Sutlej; pop. about 15,000.—In the presidency of Bengal is another town of the same name.

**BELBEC**, or **KABARTA**, a small river of the Crimea. It rises in the mountains to the N. of Aloopka, and empties into the Black sea, on the W. side of the peninsula, to the N. of Sebastopol, and S. of the mouth of the Katcha. The valley of the Belbet is agreeable and fertile, and covered with vineyards which produce fine grapes, from which the Tartars prepare a poor wine. The Anglo-French army, Sept. 24, 1854, encamped upon the banks of the Belbec, 4 days after the battle of the Alma.

**BELCHER**, **SIR EDWARD**, grandson of Chief-justice Belcher, of Nova Scotia, a British naval officer and hydrographer, born in 1799, entered the navy at an early age, and, after having taken part as midshipman in the defence of Gaeta and the battle of Algiers, he was in 1819 appointed to the Myrmidon sloop, destined for the African station. In 1825 he became assistant-surveyor to the Behring's straits discovery expedition under Capt. Beechey in the Blossom. In 1829 he was promoted to the rank of commander, and served on the coast of Africa, and of Portugal, rendering on the latter occasion valuable services to the British residents by protecting their property during the political troubles in Portugal. Subsequently he was engaged for a number of years in a voyage round the world in the surveying-vessel, Sulphur. In 1841 we find him in the Chinese waters, exploring the inlets of the Canton river, and materially assisting in securing the triumph of the British army. In acknowledgment of these services, he was knighted and appointed post-captain. Afterward he was employed on board of the Samarang, on surveying service in the East Indies, and was severely wounded while assisting the rajah of Sarawak, Sir James Brooke, in his efforts to subdue the pirates of Borneo. From 1852 to 1854 he commanded the expedition in search of Sir John Franklin. On his return to England, he was tried before a court-martial for voluntarily abandoning the ships. The case against him, however, was not legally supported, he was acquitted, and his sword returned to him, but while some of the other officers were commended, his name was passed over in significant silence. Sir Edward has written books on his various surveying expeditions, and a treatise on practical surveying. His best known work is his "Narrative," giving an interesting account of his voyage round the world.

**BELCHER**, **JONATHAN**, governor of Mas-

sachusetts and New Jersey, born in Jan. 1681, died in 1757. He graduated at Harvard college in 1699, visited Europe and made acquaintance with the princess Sophia and her son, afterward George II.; returned to Boston, and lived there as a merchant. He was chosen a member of the council, and in 1729, went as agent of the colony to England. At the death of Gov. Burnet in 1780, he was appointed to the government of Massachusetts and New Hampshire, which station he held 11 years, and was then superseded. Repairing to England, he obtained a victory over his opponents, and received the government of New Jersey, where he arrived in 1747, and where he spent the remainder of his life. He enlarged the charter of Princeton college, and was its chief patron and benefactor.—**JONATHAN**, chief justice of Nova Scotia, second son of the preceding, died at Halifax, March, 1767, graduated at Harvard college in 1728, studied law at the Temple in London, and was one of the first settlers of Chibucto, afterward called Halifax. In 1760 he was appointed lieutenant-governor, and in 1761 chief justice.

**BELCHER**, **TOM**, an English pugilist, born at Bristol in 1783, died at Peckham, Dec. 9, 1854. He was the hero of 12 prize fights, in 8 of which he was the conqueror, in 8 he was defeated, and the 12th was a drawn battle. He was one of the 18 pugilists selected to act as pages at the coronation of George IV., to protect the access to Westminster abbey.

**BELCHERTOWN**, a village in the eastern part of Hampshire county, Mass., was originally granted to Gov. Belcher and others, and named from him. It contains a classical school, and is known for its manufactories of light wagons. Pop. in 1855, 2,698.

**BELCHITE**, a Spanish town, 23 miles S. S. E. of Saragossa, noted as the scene of a victory gained June 18, 1809, by the French, under Suchet, over the Spanish forces under Blake. Belchite has some manufactories of woollens. Pop. 2,655.

**BELED-EL-JEREED**, or **BLED-EL-JEREED**, the Bilidulgerid of old maps, "the land of dates," a district of the Atlas chain, on the borders of the great Sahara. It has earned its name, not from its absolute, but its comparative fertility, the date palms being dear to every Arab.

**BELEM** (properly **BETHLEHEM**), formerly a market town, now a suburb of Lisbon, on the Tagus, S. of the city. It derives its name from the church of Our Lady of Bethlehem, built here by King Emanuel in 1499, on the return of Vasco da Gama from his expedition to India around the Cape of Good Hope. Belem contains a Gothic church, in which is the tomb of the royal family of Portugal. It has also an old fortress, called *Torre de Belem*, which rises from the bank of the Tagus, and with its batteries commands that river. This quarter of the city contains a royal palace and the residences of many persons of note.—Also a city of Brazil. See **PARA**.

**BELEMNITES** (Gr. *βέλεμνον*, a dart, or arrow), a class of extinct molluscous animals, belonging to the same division as ammonites, termed *cephalopodous*, from the organs of motion being arranged around the head. The fossil remains of the animal are met with in the rocks of the upper secondary, both in this country and other parts of the world; they are particularly abundant in the strata of the green sand formation in New Jersey. The part preserved, often detached from the loose strata, is a pointed cone sometimes 8 inches long, of brown color and stony material, resembling in shape the head of a dart or javelin, whence their name. The larger end is hollow, the cavity being of similar shape to that of the whole specimen. Few fossil shells have attracted so much interest as these simple-looking, though still obscure, belemnites. They are found by millions in the formations to which they belong; and from 80 to 90 species of them have been recognized. They early attracted the attention of scientific men as well as of the common people; and it appears from the memoir of M. de Blainville, that no less than 91 authors, whose names he gives, beginning with Theophrastus, have written on this subject. The ancient inhabitants of Asia Minor are represented by some writers to have designated these fossils by the term *dactyli Idai*, fingers of Mount Ida, which, however, according to other learned authorities, was very differently applied, some describing these unknown *Dactyli* as divine persons worthy of worship, as having nursed and brought up the god Jupiter; and others, as Sophocles, making them to be the inventors of the manufacture of iron. But whatever truth there may be in these representations, the term certainly finds a very proper application in these finger-shaped fossils, and the ancients, if they so used it, displayed a better taste in their selection of a name than the moderns, who call them thunder stones, devil's fingers, and spectre candles. By the researches of Dr. Buckland and Prof. Agassiz, the true nature of the belemnites has been fully established. The hollow pointed body is composed of carbonate of lime, part of which was the original fibrous shell, and the remainder introduced by infiltration. Thus the fossil became crystalline and nearly solid. The cavity was the receptacle of the animal, but as in the genera *bullo* and *sepia*, and the coralline zoophytes, it by no means covered the fleshy portions; these, on the contrary, extended outside of the shell, and enclosed it, very much as a skeleton is enclosed and covered with the softer portions of the body. Within this cavity was the apparatus of the air chambers and siphon, common also to the ammonite, nautilus, and other chambered shells, by means of which the animal could rise or sink at will. But the belemnites also were provided with the ink-bag apparatus of the modern *sepia*; an important protection for their soft bodies, unguarded as they were by any outer shell. These ink-bags were noticed in a communica-

tion by Dr. Buckland to the geological society of London in 1829, as having been found by him in a fossil state, and which he supposed, from comparison with known molluscous animals that were furnished with them, must have belonged to cephalopods connected with belemnites. Subsequently, Prof. Agassiz met with specimens retaining the ink-bag within the cavity; and the fact being thus established, the name *belemnosepia* was thereupon given to the family in the class of cephalopods comprising all the species of belemnites. From the immense numbers of these animals, and also of the still more abundant varieties of ammonites, which flourished during the periods of the formation of the oolite and cretaceous groups, Dr. Buckland is led to infer that these extinct families filled a larger space, and performed more important functions among the inhabitants of the ancient seas, than are assigned to their few living representatives in our modern oceans; and in the retention through long epochs of time of so delicate an apparatus as that of the air-chamber and siphon, continued through successive species, and given to the nautilus of the present period, he sees the uniform and constant agency of a watchful and controlling intelligence.

**BELESTA**, a town and commune of France, department of Ariège, 17 miles E. S. E. of Foix; pop. 2,700. Its claim to notice rests mainly upon the intermittent spring of Fontestorbe. This spring rises in a natural grotto or cavern, and is so copious as to form the principal part of the river Lers, a feeder of the Garonne. The stream which flows from the cavern is 18 or 20 feet wide, and a foot or more deep, and runs very rapidly, yet in the summer and autumn, and whenever there is a drought, it becomes intermittent. The intermission takes place at equal intervals twice in the 24 hours.

**BELFAST**, a town in Waldo county, state of Maine, situated on a broad bay of the same name, on the west side of the Penobscot river, 80 miles from the ocean. Castine, 9 miles distant, occupies the opposite side of the bay. It was incorporated in 1773, and first settled in 1785. The harbor is deep and spacious, and always open; so that it is the winter port of the Penobscot. The Passagassawakeag, a small river, empties into the Penobscot at this point, and furnishes a limited water power, which is used in the manufacture of lumber. There is considerable ship building and commerce, the vessels built in 1854 amounting to over 12,000 tons. The schools are excellent, and there is a well-endowed academy. The churches are handsome specimens of architecture; and the public buildings, the court house, custom house, are neat and substantial. Lines of steamboats connect with Bangor, Portland, and Boston. A company has been incorporated here with a charter for a railroad to Quebec, *via* Moosehead Lake. Three weekly newspapers are published here, and there are 2 banks. Pop. in 1810, 1,959; 1820, 2,026; 1830, 3,077; 1840, 4,186; 1850, 5,051; 1857, about 6,000.

**BELFAST**, a seaport town and parliamentary borough of Ireland, county of Antrim, 88 miles N. N. E. of Dublin; pop. in 1841, 75,808; in 1851, 99,660. It is on the Lagan, near its embouchure in Belfast bay. The site of the greater part of the town is low and flat, having been reclaimed from the marshy banks of the Lagan. The river is 250 yards wide, and was formerly crossed by a bridge of 21 arches, erected in 1682. In 1840, this was replaced by an elegant stone bridge of 5 arches, each of 50 feet span. The houses of the town are mostly of brick. The streets are regular and spacious, macadamized, and well lighted; and the enterprise and activity of the inhabitants, particularly the mercantile class, have given Belfast the reputation of being the first commercial town in Ireland. It has numerous places of worship. At the head of its educational institutions is the queen's college, built of brick and stone, at an expense of upward of £25,000, and opened in 1849. For the maintenance of the institution, £7,000 a year is allowed. There are, beside, the royal academical institution, founded in 1810; the Belfast academy, the Lancasterian school, and numerous national schools and private seminaries. Belfast has many charitable and benevolent institutions; a natural history society; a royal botanical and horticultural society; a society for the promotion of knowledge; a teachers' association; and a mechanics' institute. It is the great depot of the linen trade of the north of Ireland, and is also the chief seat of manufactures of cotton and linen, which furnish work to upward of 1,200 people. There are, also, distilleries, breweries, flour mills, foundries, tan-yards, vitriol works, a felt manufactory, saw mills, extensive ship and rope yards. Steamers ply regularly between Belfast and London, Liverpool, Fleetwood, Carlisle, Whitehaven, Glasgow, Greenock, Stranraer, Androssan, and Dublin. In 1853, 5,711 vessels (768,500 tons) entered the port. Belfast is a comparatively modern town. It was erected into a municipality and parliamentary borough early in the 17th century. Three railways diverge from it: N. W., the Ballymena and Carrickfergus railway; N. E., the County Down, and S. W., the Ulster railway, in connection with a line to Dublin.

**BELGÆ**, one of the 3 peoples who divided the possession of the whole of Gaul among them, at the time of its invasion and conquest by Julius Cæsar. The other 2 were the Celts and Aquitanians, the former possessing the middle of France, from the British channel and the Seine and Marne to the bay of Biscay and the river Garonne, which divided them from the Aquitani. The Belgæ occupied, therefore, nearly the country which constitutes, at present, the kingdoms of Belgium and Holland. It is not a settled point among ethnologists how far the Belgæ and Celts of Gaul were of different or kindred races; nor at what time, whether previous or subsequent to this period, the intermigrations with Britain occurred, which

had as their result the establishment of a Cambro-Briton, rather than a Celtic population, on the southern shore of the channel, from the mouth of the Seine to Douarnenez bay; nor is it well ascertained whether the Celts of Gaul were analogous to, or identical with—as their name would seem to indicate—the Celtic Gaël of the highlands of Scotland; or with the Erse Celts of Ireland; or, lastly, with the Cambro Celts of southern and western England. It is assumed, however, from many considerations, that the Belgæ had at least a mixture of Teutonic blood, if they were not Teutons; and this the obstinacy and doggedness of their characters, and the absence of that nervous and irritable mobility, both of intellect and temper, which Cæsar especially ascribes to the Celtic Gauls of his day, and which continues to the present hour to be a characteristic of the purely Celtic races, seems to give reason for accepting as truth.

**BELGAUM**, a town in the presidency of Bombay, British India, and the head-quarters of the southern division of the Bombay army. Its site is elevated and healthy, and it is strongly fortified. The British captured this place in 1818, after a long and vigorous siege. Pop. about 8,000.

**BELGIOJOSO**, a town of Lombardy, northern Italy, containing a fine castle belonging to the princes of Belgiojoso. Francis I. passed the night in the castle after his defeat at Pavia, Feb. 24, 1525. Pop. of the town, 8,000.

**BELGIOJOSO**, **CRISTINA TRIVULZIO**, princess of, born in Milan, June 28, 1808, of the illustrious family of the Trivulzios, which had been Guelphic for centuries, always standing for the political liberty and national independence of Italy. Her education was directed by the celebrated Manzoni; and thus by culture, as well as under hereditary tradition, her mind was developed in the love of freedom and of her country. In the year 1824, she was married to the prince Emiglio di Belgiojoso, a scion of the house of Este. This union did not prove happy for the princess. Some time after the marriage, she resided successively in Florence, Naples, and Rome. The French revolution of 1830 found her at Geneva. Shortly afterward a movement took place in Romagna, and one was preparing in Lombardy, when the princess went to Paris to ascertain the intentions of the French cabinet and of Louis Philippe. She met with a cordial reception at the capital, and her saloons were at once filled with the most eminent political and scientific men. Lafayette was an intimate, confidential, and daily visitor. The strong preventive measures of Austria, however, left to the patriots of Lombardy no hope of a successful rising, and the suspected chiefs avoided, by a seasonable escape, the dungeons of Spielberg, Carinthia, and Hungary. Count Appony, the Austrian ambassador at the court of the Tuilleries, intimated to the princess that she must either return to Milan, or that her immense estates

would be put under sequestration, and finally confiscated. She did not hesitate a moment; in one day she dismissed her household and carriages, abandoned the luxuries of a palace, and took a small apartment several stories high. Here she was not deserted by French society; servants, statesmen, artists, paid her even more court in those mean lodgings than in her former splendor. It was suggested that she might profit by her varied talents. Being skilled in drawing, she undertook to make the likenesses of the prominent men of all parties in the chamber of deputies, of whom M. Bichon and others were to write biographies. Several drawings were thus made, but a severe illness interrupted the undertaking. During these years of honorable poverty the princess attended the lectures of the college of France, of the Sorbonne, of the reformer Buchez, and many others. No new idea or tendency escaped her attention, and she became familiar with the whole philosophical and social movement of that epoch. Her small parlor served as a lecture room for savants and thinkers, among them the original German Hoëne Wronsky, and the celebrated Italian, Orrioli. In the course of the year 1834, the Austrian government, yielding to the entreaties of the mother of the princess, who lived at Milan, somewhat mitigated its severity, and allowed a small portion of her previous income of about \$140,000 a year to reach her. Some time afterward, through the interference of her friends, and principally through that of Mignet, the celebrated historian, a staunch supporter and favorite of Louis Philippe, and that of Marshal Sebastiani, Louis Philippe obtained from Prince Metternich the restoration of her fortune. About the same time the Saint Simonians, then led by Enfantin, Michel Chevalier, and Duvergier, elected her as the representative of the living law in the name of woman made socially equal with man in the new religion which they were then preaching, but she declined the honor. Restored to her estates, the princess devoted her time, income, and even her capital, to ameliorating the condition of her Italian peasantry, establishing numerous elementary schools and asylums for children, endowing marriageable girls, and organizing regular distributions of food among the poor. Always prompt to alleviate human suffering, when Augustin Thierry lost his wife, who was his reader, the princess undertook to become the amanuensis of the great historian. Some writings now appeared under her name. They aimed at a catholic philosophy in imitation of the Abbé Bautin, with a strong tinge of the Italian spirit. In 1847, she went to Italy, then fermenting with the reforms of Pius IX. She visited Geneva, Florence, Rome, Naples, and took up her residence in Milan. When Milan and Lombardy rose, she proffered her whole fortune to the patriotic cause, and at her own cost equipped several hundreds of volunteers, but her energetic counsels were not followed. When fate de-

cided against Italy on the plains of Custozza, and Milan surrendered to the enemy, the princess retired to Rome. During the siege by the French army, she animated by her fervor the defenders of the city. She presided over the hospitals, and in company with the American, Margaret Fuller, devoted night and day to assuaging the sufferings of the wounded. On the fall of Rome, when the revolutionists were sent into exile, the princess shared their lot and went to Malta, whose Irish commander refused them a landing. They then went to Athens, the heroic woman sharing the common sufferings and dividing her scanty purse with her companions. From Athens she went to Constantinople, and there earned a humble livelihood by corresponding with American and European journals, her fortune having once more been confiscated. Finally, she resided several years in Asia Minor, under the special protection of the sultan, who gave her a grant of land near Nicomedia. After travelling in Syria, she was on her return to Constantinople, when she was murderously attacked by one of her servants. But the wound was not fatal. After her recovery, she returned to Europe and arrived at Paris. In 1855 her fortune was restored to her by the Austrian government; but she still resides at the French capital. Though educated in all the refinements of wealth and luxury, she has twice deliberately sacrificed her fortune to her convictions, and deliberately chosen poverty and exile. The versatility of her intellectual powers is remarkable. She has been able to learn and comprehend the most various and opposite sciences. She mastered mathematics, in which Arago was her teacher, and solved the highest problems with the same facility as song and music. She studied and mastered the Chinese. Her manners are marked by that graceful ease and simplicity peculiar to Italian women, with a modesty of mind peculiar to herself, and without any disposition to make a show of her superior acquirements. A work illustrative of Asiatic life, by the princess Belgiojoso, has recently been published in Paris. Her husband, who was one of the most famous amateurs of music in Europe, and remarkable for his handsome person, died at Milan at the beginning of 1858.

**BELGIUM** (Fr. *La Belgique*, Ger. *Belgien*), a kingdom of Europe, situated between the north-western part of France and Holland, Germany, and the North sea, and extending from 49° 31' to 51° 27' of N. lat., and from 2° 37' to 6° of E. long.; area, 2,942,574 hectares, equal to about 7,273,612 acres; pop. in 1816, rather above 3,000,000; in 1832, 4,064,285; in 1849, 4,859,090; in 1856, 4,530,228. Its greatest length from S. E. to N. W. is 173 English miles, and its greatest breadth, from the most northern part of Antwerp to the most southern part of Hainaut, is 112 miles. This area and population are distributed in 9 provinces, as follows:

	Area in acres.	Culti- vated.	Pop., Jan. 1, 1848.	Pop., Jan. 1, 1856.
Antwerp.....	689,773	394,792	418,824	484,485
Brabant.....	510,954	271,504	711,882	748,840
Flanders, W.....	798,916	669,219	626,847	624,912
Flanders, E.....	740,474	621,701	781,143	776,960
Hainaut.....	919,846	724,997	728,539	769,841
Liège.....	714,619	516,535	460,668	508,654
Lomburg.....	596,048	381,183	186,621	191,708
Luxembourg.....	1,091,909	371,686	197,974	198,753
Namur.....	904,465	447,826	295,143	286,075
	7,375,612	4,800,398	4,350,090	4,550,928

The chief city of Belgium is Brussels, pop. in 1856, 150,000. The other important cities are Antwerp, pop. 79,000, Bruges, pop. 49,600, Ghent, pop. 115,296, Liège, pop. 80,245, Namur, pop. 23,500, and Malines, pop. 23,800. The surface of Belgium is generally level. In the east there are some high and well-wooded lands, connected with the Vosges mountains. Near Malmédy there is also a wild tract of elevated country of small extent, the highest elevation not exceeding 2,800 feet. Between the Meuse and the Scheldt there is another ridge.—The rivers of Belgium are the Meuse, the Scheldt, the Ourthe, and the Sambre. The Meuse runs part of its course only in Belgium, rising in France and passing through the provinces of Namur and Liège. It is navigable throughout its Belgian course. The Scheldt rises in France, enters Belgium in the province of Hainaut, and runs across the Belgian territory, passing into Holland below Antwerp. It is navigable throughout Belgium, but the sand banks at its mouth interfere with its navigation, and the policy of the Dutch government not encouraging a removal of them, the commerce of Antwerp suffers materially. The Ourthe rises in the Ardennes, and falls into the Meuse at Liège. The Sambre flows from France into Belgium, and falls into the Meuse at Namur.—The northern part of Belgium is of tertiary formation. In the south-eastern provinces the lower formations are red sandstone and limestone, resting upon granite, quartz, and slate. Fossil animals are very numerous; the limestone caverns through which the river Lesse has made its way are remarkable natural curiosities. E. and W. Flanders are principally sand.—After England, Belgium yields more fuel than any other country in Europe, the coal-fields producing in 1855 8,500,000 of tons (representing a value of nearly \$20,000,000), of which  $\frac{1}{2}$  are consumed in the country, and the rest exported to France and Holland. The production of iron is also large, amounting in 1855 to 750,000 tons. The best iron is found in the country between the Sambre and the Meuse. Lead, manganese, and other minerals, especially zinc, are found in various parts of the country. The most celebrated zinc mines are between Liège and Aix la Chapelle. The country abounds at the same time in building, paving, and lime stones, roofing slate, and marble. The black marble of Dissant is renowned for its beauty. The min-

eral wealth of Belgium is, next to agriculture, the most important source of her national prosperity. The most celebrated mineral springs of Belgium are at the famous watering place Spa, which is situated near the frontier of Rhenish Prussia. Another popular watering place of Belgium is Ostend, to which many visitors resort for the purpose of bathing in the sea.—The canals, though numerous, are not equal in length to those of Holland, being about 300 miles. The greatest of these is the Brussels canal, supplied by the river Lenne, which was opened in 1550. Ghent is connected with the sea by a canal opening into the E. Scheldt, in some measure accounting for the Dutch control of the mouth of that river. It admits vessels drawing 18 feet. The railways of Belgium were the earliest of continental Europe, and rapidly followed those of England, which they have surpassed in unity of design and economy of construction. Soon after King Leopold's accession, he took measures to establish railways. The country was surveyed and levelled by government engineers, the lines decided on, and the permanent way was constructed at the expense of the country. Mechlin, on account of superior engineering advantages, was made the centre of the system. The policy of low fares and good accommodation was adopted, and the result, if not one of success as a commercial speculation, has answered the aims of a wise government.—There are nearly 550 miles of railway now open, paying  $2\frac{1}{2}$  per cent. interest on their outlay. The receipts of the public treasury from railways in 1856 were 22,780,000 francs, and in 1857, 23,780,000 francs. The total cost of the earth works and permanent way has been \$33,268,961, raised in 5 national loans.—Electric telegraphs have been in operation since March 15, 1851, and belong to the government.—The Roman Catholic religion is predominant in Belgium. The stipends of ministers of all denominations are derived from the state. The archbishop of Malines is the Catholic primate. There are government universities at Ghent and Liège, a Roman Catholic university at Louvain, and a free university at Brussels. There are superior public schools in most of the cities, beside the primary schools throughout the kingdom; and a great number of schools have been established for instruction in particular branches of industry—agricultural processes, chemistry, design.—The number of journals gradually rose from 84 in 1830 to about 200 in 1848, of which from 50 to 60 were published in the Flemish language and the rest chiefly in French. The abolition of the stamp tax in the latter year and the reduction of the rate of postage have given a further impetus to the circulation of newspapers, and their number has been continually increasing within the last 10 years. The *Indépendance Belge*, a liberal journal published at Brussels, and originally established in 1831, under the name of *Indépendant*, has the largest circula-

tion and about 9,000 subscribers. The *Observateur*, established at Brussels since 1835, is less conservative in its tone, and the other first-class journals in the liberal interest are the *Précurseur*, issued at Antwerp since 1835 (an important shipping and commercial paper), the *Journal de Liège*, published in the latter city (one of the oldest journals of Belgium, established during the Spanish and Austrian rule), the *Messenger de Gand*, the principal political journal of Ghent, the *Journal de Verviers*, *De Schelde*, the best Flemish journal of Antwerp, and the *Burgerweleyn*, an important Flemish organ, published at Bruges. The other political journals which enjoy the largest patronage, are the *Emancipation* of Brussels (in the interest of the so-called Catholic party), the *Journal de Bruxelles* (the official organ of the ultramontane party), the *Gazette de Liège*, the *Journal d'Anvers*, the *Conservateur*, and the *Standaard* (the latter in Flemish), published at Ghent, and the *Ami de l'ordre*, at Namur. The principal organs of the democratic party are the *Nation*, of Brussels, the *Tribune*, of Liège, and the *Reforme*, of Verviers. The *Etoile Belge* and the *Télégraphe* (the latter in existence since Sept. 1854), are anti-Bonapartist journals, published at Brussels. The *Nord*, which appeared within the last few years at Brussels, is a journal dedicated to the interests and policy of Russia. The organ of the government is the *Moniteur Belge*, in existence since 1831. The independent and general newspapers of largest circulation are the *Echo de Bruxelles* and the *Journal de Belgique*, both published at the capital, where also 2 satirical prints flourish, namely, the *Sancho* and the *Mephistopheles*. The principal historical magazine is the *Messenger des sciences historiques*, published at Ghent since 1833. The most eminent polemical periodicals are the *Revue catholique* (conducted by the professors of the university of Louvain), the *Journal historique et littéraire* (a rigidly orthodox publication, conducted with great ability by Kersten, of Liège), and the *Revue Trimestrielle*, progressive in its tendencies, which appeared at Brussels since 1854. The principal Flemish magazine is the *Taalverbond* of Antwerp. The principal religious papers for the Roman Catholic interests are, the *Préavis historiques, littéraires et scientifiques*, in existence since 1852, and for the Protestants the *Gleaner missionnaire*, established in 1844, and the *Chrétien Belge et l'Union*, in existence since 1850. The principal organ of industrial enterprises is the *Bulletin de l'industrie*, of fine arts the *Renaissance*, of music the *Gazette musicale*. The principal periodical devoted to the cause of education is the *Moniteur de l'enseignement*, published at Tournai, while jurisprudence, medicine, and other sciences are equally represented by magazines, which all sprung up within the last 20 years. Literature and science are much indebted for their progress to the efforts of the various academies of sciences, of which the institu-

tion of Brussels is the most important, and to the encouragement of the government. Quietlet, in the field of mathematics; Nothomb, de Gerlache, Gachard, Borgnet, and others, in the sphere of history; Conscience, the Flemish novelist, Bormans, Blommaert, &c., in the science of philology; Willems, the eminent Flemish scholar, in the same branch of knowledge; Bériot, Vieuxtemps, Fétis in music; Gallait, de Keyser, van Eyken, Verboekhoven, &c., in painting; Jehotte, Fraikin, &c., in statuary, and many other contemporaneous names in various other branches of literature, science, and art, attest the growth and intellectual activity of this young and prosperous country.—The agriculture of Belgium is not surpassed by that of any nation. The originally unfavorable soil has by generations of careful culture been raised to great productiveness. Large farms are rare, the subdivisions of the soil have been carried down to garden size, and less than  $\frac{1}{3}$  of the whole area of the kingdom is unprofitable. Flax is an object of peculiar care in Belgium, and the Belgian system of cultivation is studied everywhere. E. and W. Flanders alone produce flax to the value of \$8,000,000 annually. The artificial grasses are also generally productive, while the production of root crops by artificial manure is matter of elaborate study and attention. Belgium is celebrated for its horses, of which it possesses nearly 800,000. Those of the Ardennes are excellent cavalry horses, and those of Namur are famous draught horses. The number of cattle exceeds 1,000,000, and of sheep 700,000. The government pays special attention to the improvement of horses and cattle.—In commercial pursuits and manufactures, Belgium has long enjoyed the highest reputation. But the fame of her linens and woven goods had somewhat deteriorated from their high estimation in the 14th century, until the separation from Holland. The lace of Brussels and Mechlin, the linens and damasks of Cambray and Liège, the woollens of Ypres, the cotton goods, carpets, and hosiery, compete with the productions of the French and English looms. The machine factory of Cockerill and Co., founded at Liège in 1816, is one of the greatest works of the kind in Europe. Liège has a cannon foundry, and is noted for its manufactories of fire-arms.—The foreign commerce of Belgium during its connection with Holland suffered for the sake of Amsterdam and Rotterdam, and judicious plans of internal improvement have since occupied the national attention. The entries at the Belgian ports, chiefly Antwerp and Ostend, in 1855, were 2,558 vessels, of 441,554 tons, and the clearances were 2,507 vessels, of 432,457 tons. The imports for the same year were 354,708,000, and the exports 375,231,000 francs. The imports from the United States to Dec. 1857, were \$1,950,698, and the exports to that country \$5,060,811. The revenue of Belgium for 1857 was 188,604,990 francs, and the expenditure 186,680,758.

The public debt was created by the assumption of 220,000,000 francs of the enormous debt of the kingdom of Netherlands at the time of the separation, and now consists of 635,946,647 francs, a large portion of which has been expended at home, as, for instance, in the railways. The military force of the kingdom, according to the law of June 8, 1853, consists on the war footing of 100,000 men, beside the national guard. The actual standing army in 1857 was, however, 78,718 men.—The history of Belgium as an independent state dates from 1830, at which time it was separated from the kingdom of the Netherlands. After the decay of the Roman empire a number of independent nobles established themselves in Belgium, among whom the counts of Flanders rose to historical distinction; for failure of male heirs their possessions devolved to the house of Burgundy, in 1385, which gradually extended its influence, by conquest or treaty, over the greater part of the Netherlands. On the death of Charles the Bold, his daughter Mary, the greatest heiress of Europe, married Maximilian, emperor of Germany, and in his successor Charles V. the rule of the Flemish provinces was joined to the crowns of Spain and Austria. Both Maximilian and Charles respected the freedom and rights of their industrious and stout-hearted Batavian and Belgian subjects, and were careful to make no encroachments. But Philip II., at once a fanatic and a despot, severely tried their patience, and his fiscal exactions, with the establishment of the inquisition, drove them to that famous revolt which ended in the independence of the United Provinces, and the confirmation of the yoke of Spain on the necks of the Belgians. From this period Belgium followed the fortunes of Spain. In 1598 Philip bestowed the Flemish provinces on his daughter Isabella and her husband Albert, during which period something was effected toward the settlement of the internal affairs of the province. On the death of Isabella without issue, Spain again assumed the government, and the Low Countries were for the next century the battle-field of Europe. The cities were taken and retaken, the territory cut up, and passed from one power to another by the treaties of Aix la Chapelle, Nimeguen, and Ryswick; and, as though these influences had not been sufficiently injurious to the country, the treaty of 1715 delivered over several of the fortresses of Belgium to her commercial rival Holland, in order to create a barrier against French ambition. Holland closed the Scheldt, and so diverted the trade of Antwerp, and in 1792 the rising commerce of Ostend was sacrificed to the Dutch. At the end of the war of succession the Low Countries passed, almost in their former integrity, to the house of Austria. The empress Maria Theresa appointed Charles, duke of Lorraine, her viceroy, and in his mild and equitable rule, the people enjoyed an interval of peace. Joseph II. shook off the bonds of the barrier treaty with the Dutch, and

compelled Holland to withdraw her army of occupation, but could not succeed in re-opening the navigation of the Scheldt. Joseph II. also addressed himself to the reform of existing abuses; but in Belgium, as in other parts of his empire, his precipitation placed a lever in the hands of those who opposed his plans, which they used successfully to excite popular discontent against his measures. The states were against him and refused to pay taxes. In 1788 the Catholic seminary of Louvain, which had been closed by the government, was reopened. This sign of weakness encouraged the discontented, who at once organized for measures of active resistance. The theories of freedom, and the schemes for a new organization of society, which were at that period rife in the French capital, spread to the Low Countries, and on Dec. 11, 1789, the discontent was made evident by a movement in Brussels against the garrison, which was forced to capitulate. Joseph and his successor Leopold made liberal offers for an adjustment of the differences and for the reestablishment of the constitution. But the liberal leaders refused all terms, and, rendered over-confident by their past success, stood out for an independent republic. Internal dissensions soon threw them into the power of the Austrians again, when Pichegru crossed the frontier under instructions from the directory, to assist the Belgians. The Austrians were rapidly driven back, and the Belgians found themselves incorporated into the French republic, their dream of independence dissipated, and eventually they became a part of the empire. On the abdication of Fontainebleau Belgium was put under the control of an Austrian governor, but on the final peace Prince William Frederic of Orange-Nassau received as the reward of his faithful adherence to the allied cause, the territory and title of king of the Netherlands. The inclinations and habits of the Belgians, which led them to a French alliance, were not consulted in this settlement; nevertheless a temperate and conciliating policy on the part of the Dutch would no doubt have smoothed away obstacles between parties whose ancient recollections might have prompted friendly relations. As it was, the differences which might have formed the strongest bonds of union in mutual support became the grounds of mutual aversion. The Dutch were engaged in commerce, the Flemings in agriculture and manufactures. The Belgians, from an uninterrupted intercourse not only during the republic and the empire, but since the days of Louis XIV., had adopted the French language, at least in the higher circles, and in all public proceedings. The Dutch were Protestant and Calvinist, the Belgians Catholic. The Dutch were only half as numerous in the new kingdom as the Belgians. The education and modes of thought of the Dutch were particularly staid and leaned to Puritanism. The Belgians in their free intercourse with France had acquired ideas and principles, which, in their liberalism and in-

dependence of authority and tradition, were the very opposite of Dutch precision and conservatism. Unfortunately the Dutch looked on the new territory as the spoils of victory. The Hague was henceforth the seat of government. The use of the French language in judicial and government proceedings was to be abolished; and although the ordinances for carrying out this arrangement were mitigated to meet objections, still the offensive order remained. In the states-general Holland with her 2,000,000 was to have a number of representatives equal to Belgium with her nearly 4,000,000 of people. Belgium had only a debt of 4,000,000 florins, Holland a debt of 1,300,000,000 florins. This was imposed on Belgian industry. The constitution which contained all these objectionable provisions was passed by an assembly in which the dissentient Belgian nobility were an actual majority, but the absent Belgians were reckoned as assenting, and thus the majority present was converted into a minority. The heart-burnings and ancient rivalry of the two countries were increased as well by the measures themselves as by the proceedings taken from year to year to carry them into effect. The flame, which might have died out from neglect, was kept alive by perpetual fanning. The opposition was composed of heterogeneous elements, French liberalists with Catholic ultramontanists. This divided party was permitted to fuse into a union which was designated "monstrous" by the king, but the mere fact ought to have been a warning. There was indeed but one sentiment in the Belgian opposition. They accorded upon the most irreconcilable questions, provided only that in such unnatural friendship they could display their enmity against the Dutch government, which in 1829 decided on energetic proceedings. In May, 1830, disregarding 640 petitions, they carried a new law of the press. Officials holding Belgian opinions were dismissed. M. de Potter, the head of the Belgian party, opened a subscription for all those who thus suffered for their principles. De Potter and his confidential friends, Tielemans, Bartels, and De Newes, were arraigned for sedition; the charge was proved by their private correspondence with each other. They were banished. The public mind was in a state of excitement, which was raised to its highest pitch of intensity by the revolution of July in Paris. At length on August 25, 1830, Auber's *Masaniello* (*La Muette de Portici*) was performed at the grand opera, at Brussels. The spirit-stirring airs moved the souls of those present, and the market-chorus and the revolutionary scene sent the electric shock vibrating through all hearts; the house was rapidly emptied, the streets resounded with tumultuous cries, and the first blow of Belgian independence was at once struck. The office of the *National* newspaper, the government organ, was at once attacked, the *matériel* destroyed, and the residence of its chief editor, Libry Bagnano, was the next point which shared the

same fate. The people now proceeded in their work; they divided themselves into parties, broke open the armorers' shops, attacked the houses of the Dutch ministers, and had possession of the town all night, gratifying their rage on the government offices and establishments. The troops were mustered, but nothing could be done until daybreak. They were then ordered out, without any combined plan; they fired upon the people. This only increased the popular exasperation. Barricades were formed, and outrages commenced on private property. The civic guard now turned out, took possession of the military posts and restored order. The news of the revolution in Brussels spread rapidly through the kingdom, and in all the principal cities the same scene was reenacted. On August 28, a congress of various citizens of distinction took place at the hotel de ville, in Brussels; they adopted an address to the king, which was altered by the deputies of Liège into a petition. They asked for reform of the system of government and dismissal of the unpopular ministers; trial by jury in criminal prosecutions and proceedings affecting the press. The king received the deputies at the Hague, and refused to pledge himself to any thing while under menaces of force, but promised an early consideration of the matter. This answer gave great dissatisfaction. Subsequently the crown prince was induced to visit Brussels, which he found almost impassable from the impromptu fortifications raised by the people. He held a conference with the leading men of the city, and appointed a committee for redress of grievances. The Liège deputies, however, boldly told the prince that nothing short of total separation from Holland would now pacify the people. The prince listening with commendable patience, the orator of the party advanced such cogent reasons that he promised to report the matter to the king, if on their part they would pledge themselves for the loyalty of the Belgians to the house of Orange. The compact was carried by acclamation. The prince dissolved the recently formed committee, and returned to the Hague. The king summoned here a states-general extraordinary, on Sept. 18. It was numerously attended. Matters were put in train, but the Dutch, with their accustomed phlegm, showed a dilatoriness which the impetuosity of some of the Belgian deputies attributed to intentional procrastination. Baron de Staffart proclaimed his convictions loudly on this head, and the committee of safety at Liège issued a proclamation in the name of the people. The government was deposed and a new one formed under the administration of De Potter and De Staffart. The king, on the requisition of some of the Dutch party, now sent troops to Brussels, and a proclamation was issued calling on the rebels to submit and to remove the tricolor. On Sept. 20, the streets of Brussels were rendered completely impassable. Prince Frederic advanced with 16,000 men, and on Sept. 28, attacked

the Porte de Saarbrück. After a battle of 6 hours the troops fought their way through the streets to the palace, and for 3 days there was an incessant engagement, during which the Dutch made themselves masters of the principal part of the city. But the men of Liège now put themselves in motion; reinforcements poured in, the insurgents recovered strength, and under the judicious advice of Col. Don Juan van Halen and Gen. Mellinet, Prince Frederic's position became hopeless. He ordered a retreat; Brussels was won; Mons, Ghent, Ypres, and all the other leading towns, at once declared in favor of total separation, and on Oct. 6, the Dutch garrison of Liège capitulated. Antwerp was now the only important place which remained in the hands of the Dutch, and even in that city their authority was rapidly crumbling away. Gen. Chassé had thrown himself into the citadel, and the authorities agreed on an armistice. But the insurgent forces repudiated the right of the magistrates to negotiate with the enemy, and summoned Chassé to surrender. He, however, only opened his guns on the quarter of the town in which the revolutionary troops lay, and did much harm to the city, beside destroying a vast quantity of valuable merchandise. A provisional government had been already formed in Brussels, consisting of Baron van Hoogvorst, Charles Rogier, Jolly, Count Felix de Merode, M. Gendebien, Van de Weyer, Potter, and some others. They appointed the various ministers, summoned a national congress, and settled the basis of a constitution which recognized the monarchical principle. Secretaries Northomb and Paul Devaur were directed to prepare a draft of a constitution in accordance with this basis. Prince Frederic meanwhile announced the independence of Belgium. It was too late. On Oct. 25 he quitted Antwerp, and 2 days afterward Gen. Chassé commenced a 2 days' bombardment of the town, by which wanton act the Dutch party crushed out all chance of a friendly settlement. On Nov. 10, the national congress was opened—the independence of Belgium proclaimed. The form of monarchical government was adhered to, but the exclusion of the house of Orange forever from the crown of Belgium, was carried by an overwhelming majority. King William now turned to the great powers who had given him Belgium and guaranteed his quiet enjoyment of his new dominion. At his request a congress was summoned in London, in which all the important parties were represented. The importance of this step, in reference to the settlement of Europe by the holy alliance and the congress of Vienna, can hardly be overstated. It opened the door for all future alterations in the balance of power, and nothing but the imminent danger of keeping open a dangerous outlet for disaffection could have induced the astute politicians of Europe to pass this great point. The conference at once ordered an armistice, and the retirement of the troops of both parties within their respective frontiers. On Jan. 20, 1831,

the independence of Belgium was acknowledged by the congress. William of Holland protested against this declaration, but as it was coupled with an apportionment of half the Dutch debt to Belgium, he ungraciously submitted. Belgium, on the other hand, protested against the debt, which entailed upon her the payment of 14,000,000 florins annually. The next question was a monarch. The crown was offered to the duke of Nemours, Louis Philippe's son, and declined, why we know not. This declension threw a degree of embarrassment over the proceedings of the conference, and there is ground for believing that the plan of dividing the territory like another Poland, among the strongest, was mooted. In the national congress, however, it was determined by a majority to appoint a regent in place of the provincial government, and Baron Surlet de Chokier was elected. He took the reins of government and named a ministry, which being composed of incongruous materials soon resigned, and another was appointed. The choice of the ministry and national congress now fell on Leopold of Saxe-Coburg, to whom, being found not unwilling, a formal offer of the crown was made, which he accepted. He held the balance between France and Germany, while his relationship to England as widower of the Princess Charlotte was enough to insure his independence of continental intrigues, yet not to implicate him too deeply with British politics. On July 21, 1831, he ascended the throne of Belgium. Scarcely had his reign commenced when Holland, in defiance of the armistice, sent an army across the frontier, and Leopold found himself engaged in war, with a kingdom all disorganized, an army hastily levied, and an unformed administration. Leopold asked aid from France, which was promptly afforded, and the duke of Orleans marched an army to Brussels, which compelled the Dutch forces to retreat across their frontier. William of Holland had not, however, given his consent to the new order of things in Belgium, seeing that as yet the question of the public debt was not satisfactorily disposed of. Accordingly, the conference determined on compelling Holland to evacuate the Belgian territory, and an Anglo-French army was despatched to drive the Dutch out of Antwerp, Fort Lillo, and Liefkenshoek. The siege of Antwerp began Nov. 19, 1832, and on the 24th Gen. Chassé capitulated. The other fortresses were, however, not evacuated, but Leopold declared himself satisfied to hold Limburg and Luxembourg against the strong places in question, and accordingly the French army retired. On Aug. 9, 1832, Leopold married the princess of Orleans, daughter of Louis Philippe. The new king soon found himself obliged to dissolve the chamber which had elected him, and to summon a second. The inextinguishable hostility of Holland kept up a state of great irritation in Belgium, which was not allayed, when, upon the surrender of Luxembourg to the Dutch, in pursuance of the treaty of 1831, the Luxembourgers protested loudly and

even raised a rebellion, petitioning King Leopold to maintain the integrity of the province. Notwithstanding the threatening aspect of affairs, Leopold skilfully conducted them to a peaceful issue. The events of France in 1848, naturally gave rise to a crisis of alarm and anxiety in Belgium. Leopold at once signified to the people his willingness to resign the constitutional trust he held, if such was their wish. This suggestion was not accepted. The legislature, however, proceeded to carry out the full measure of electoral reform contemplated by the constitution, and to abolish the newspaper duty. Some ultra French republicans attempted an irruption into Belgium, but they were seized at the railway station, disarmed by the Belgian troops, and sent back unhurt to the place from which they came. In the active contention for power between the liberals and the Roman Catholic party, various ministerial crises have occurred, which we cannot discuss more minutely.—The constitution of Belgium is a limited monarchy, with male succession, and in default of male issue the king may nominate his successor with consent of the chambers. The legislative body consists of a senate and house of representatives. The elective franchise is vested in citizens paying not less than 49 francs annually of direct taxes. The house of representatives consists of deputies, in the proportion of 1 to 40,000 of population. Citizenship is the sole qualification for representatives, and they are elected for 4 years (except in case of a dissolution), half retiring every 2 years. The senate has half the number of the house, elected by the citizens for 8 years, half retiring every 4 years. The senatorial qualification is citizenship, domiciliation, 40 years of age, and payment of direct taxes of at least 2,000 francs annually. The restriction created by this large proportion of taxes is enlarged by the admission of those citizens who pay the largest sums, so that the list shall always be kept up to the footing of at least one eligible person for every 6,000 inhabitants. The representatives receive pay at the rate of about 20 dollars per week. Senators receive no pay. Each house may originate laws, but money bills must originate with the representatives. The chambers assemble as of right on the second Tuesday in November. The king may dissolve the chambers, but the act of dissolution must contain a provision for convoking them again within 3 months. The number of electors in 1863, was 78,238. Titles of nobility are allowed by the constitution, but without particular privileges, all Belgians being equal in the eye of the law. Trial by jury in criminal and political charges, and offences of the press, are provided for. Taxes and the army contingent must be voted annually. The law is administered by local and provincial tribunals, with courts of appeal at Brussels, Ghent, and Liège.—Various pernicious influences have produced a vast amount of pauperism. In 1847, 232,428 persons had to be supported by the state in Flanders W., and 221,280 in Flanders E., to which pur-

pose \$500,000 were devoted. The following is the proportion of pauperism in the respective provinces alleviated by the government: Luxembourg, 1 in 69 inhabitants; Namur, 1 in 17; Antwerp, 1 in 16; Liège, 1 in 7; Limburg, 1 in 7; Hainaut, 1 in 6; Flanders E., 1 in 5; Brabant 1 in 4; Flanders W., 1 in 8. Since then the condition of the poor has been somewhat improved by the solicitude of the government to employ them in public works, by the establishment of agricultural colonies for the poor (after the plan of that of Van den Bosch), and by the general increase of commercial and manufacturing prosperity.

**BELGOROD**, or **BYELGOROD**, once the capital of a province, but now the chief town of a circle in the government of Koorsk in the S. E. part of European Russia; pop. 10,318.

**BELGRADE**, the largest and best built city of Serbia, with a good harbor, on the right bank of the Danube, at its junction with the Save, 44 miles S. E. of Peterwardein; pop. 30,000. The citadel, occupied by a Turkish garrison, is on a small strip of land between the two rivers, behind which is the city. Its parts are the Turkish quarter, which slopes to the Danube, and the Servian quarter, which borders the Save, with a quay and rows of houses in modern style. Belgrade is gradually becoming modernized, churches are superseding mosques, new buildings are being constructed in the German fashions, but its streets are filthy and not lighted, and its public accommodations most comfortable. It produces arms, carpets, silk goods, outlery, and saddles. It is the entrepot of commerce between Turkey and Austria, and the seat of the principal authorities of Serbia. Its fortifications are now rapidly decaying. Belgrade was long an object of contention between the Austrians and the Turks. It was unsuccessfully besieged by the latter in 1456; but was taken by them in 1523, and held until 1688, when it was retaken by the elector of Bavaria. Two years later it was retaken by the Turks. In 1717 it was besieged by Prince Eugene with an army of 90,000 men; after a desperate conflict the Turks were defeated, with a loss of 13,000 killed, 5,000 wounded, and 3,000 prisoners—the Austrians having only 3,000 killed and 4,500 wounded. In 1739 the Turks made another unsuccessful attempt to regain it, but subsequently came into possession of it by treaty, retaining it till 1789, when it was again taken by the Austrians, who, however, relinquished it to the Turks in 1791. It has since remained in their possession, except for a short time during the Servian insurrection in 1813.

**BELGRAM**, or **BALAGRAM**, a town of the kingdom of Oude, India, 75 miles N. W. of Lucknow. It is a very ancient place, and contains some of the finest specimens of Mogul architecture extant, but it is in a decaying state.

**BELIAL** is a compound Hebrew word, and is variously derived by Hebrew scholars. It is generally interpreted "a worthless fellow."

Some render it "idle fellow," others "one never to rise," or grow better, while the Talmudists translate it "without yoke" or restraint. It seems to be variously used in the Scriptures. In Deut. xiii. 18, it is applied to persons guilty of idolatry. Hopni and Phinehas, the sons of Eli, are called "sons of Belial." Hannah, in answer to the accusation of drunkenness made by Eli, who noticed her strange conduct in the temple, says, "Count not thy handmaid a daughter of Belial." Those who opposed the inauguration of Saul as king of Israel are, in the book of Samuel, called sons of Belial. Nabal, in his opposition to David, is called a man of Belial, and so also is Sheba, engaged in a similar cause; while Shimei, in his hatred of David because he had superseded the house of Saul on the throne of Israel, calls him a son of Belial; and Abijah, the partisan and successor of Rehoboam, applies the same epithet to the followers of Jeroboam, in the division of the government of Israel. In the New Testament the word is used but once. Paul asks the Corinthians, "What concord hath Christ with Belial?" The scriptural use of the term in the Old Testament seems generally to be to designate a wicked and unprincipled character. So far as the passage in the New Testament goes, it would convey the same idea. We must agree with Milton to set down

Belial, the dissoluteest spirit that fell.

**BELIDOR**, BERNARD FOREST DE, a French writer on military science, was born in Catalonia in 1697, and died at Paris, Sept. 8, 1761. Left an orphan in his infancy, he was adopted by an officer of artillery, who educated him as his own child. Having served in the army, he was appointed professor in the royal school of artillery at La Fère, and soon after published his work on mathematics for the use of military engineers. In 1742 he fought in Bavaria under Gen. de Ségur.

**BELIEF**. In a perfectly general sense, belief is the assent of the understanding to the truth of a proposition. In a technical and theological sense, it has come to be used as a mental exercise somewhat depending upon the volition of the individual. A distinction is therefore made between believing with the mind, or the assent of the understanding, and the affiancing of the will. This latter is the technical belief of theology, or what is sometimes termed "saving faith." Thus men are exhorted to this exercise of faith, and rebuked for having postponed it. Belief is also used theologically to express the body of doctrine which an individual or denomination adopts and professes, as when we say, after giving a summary of theological dogmas, "This is the belief of the catholic church." That is, belief is used to signify the thing believed.

**BELIEVER**, one who believes any proposition. Since about the close of the 12th century, however, the word has been applied to those who believe the doctrines of the gospel, and have been baptized in that faith. It is in this

sense another term for a member of a Christian church, and in this use it simply distinguishes all such persons from those who have not been baptized in the Christian faith, who are classed as unbelievers. The word unbeliever is also sometimes in theology applied to one who is sceptical as to the doctrines of Christianity.

**BELISARIUS**, a distinguished Roman general of the lower empire, born about the close of the 5th century, died A. D. 565. To him the emperor Justinian owed much of the splendor of his reign. Descended from an obscure family in Thrace, he attained the highest dignities of the empire. He successively defeated the Persians, the Vandals, and the Goths, taking the kings of the two latter nations, Gelimer and Vitiges, prisoners, and leading them in triumph to Constantinople, where a medal, still extant, was struck in his honor, inscribed *Belisarius gloria Romanorum*. He also suppressed the tumults arising from the contests of the blue and green factions, which, having their origin in the chariot races of the hippodrome, brought the life of the emperor into the greatest danger, and caused Hypatius to be nominated rival emperor, until he was put down by Belisarius. In all his career, he lost but a single battle, to the Persians. On his return to Constantinople, he was accused of taking part in a conspiracy, and was for a time in disgrace. But, convinced of his innocence, Justinian restored to him his favor and his dignities. The whole of the romantic story of his blindness, his imprisonment, and his begging his bread with the plaintive cry, *Dato obolum Belisario*, is pure fiction, without a shadow of foundation.

**BELIZE**. See BALIZE.

**BELKNAP**, a south-eastern county of New Hampshire; area, 387 sq. m.; pop. in 1850, 17,721. Winnepiseogee lake forms its N. E. boundary, and Winnepiseogee river flows for some distance along its southern border. The Pemigewasset touches it on the west. The surface is uneven, and between many of the hills by which it is diversified lie small lakes. The soil, though rocky in some places, is generally fertile, and in 1850 produced 14,028 bushels of wheat, 118,007 of corn, 385,092 of potatoes, 38,445 tons of hay, and 471,148 pounds of butter. There were, during the same year, 4 cotton and 6 woollen factories, a car factory, an iron foundry, 6 flour, 1 grist, and 18 saw mills in operation in the county, and 4,930 pupils attending the public schools. A railroad from Concord to Warren, and one from Dover to Alton, pass through portions of Belknap county. Capital, Gilford.

**BELKNAP**, JEREMY, D. D., an American clergyman and historian, born in Boston, June 4, 1744, died there June 20, 1798. He graduated at Harvard college in 1762, and was ordained, after 4 years' service as a school teacher, as pastor of the church in Dover, New Hampshire, in 1767, where he passed 20 years. In 1787 he took the charge of

the Federal street church in Boston, which he held until his sudden death by paralysis.—He was fitted by nature for an annalist and historian. From the age of 15 he kept notes and abstracts of his reading, and a series of interleaved and annotated almanacs, of which curious specimens are preserved. His history of New Hampshire was commenced soon after his residence at Dover, and though somewhat interrupted by the scenes of the revolution, in which he took the part of a good whig, he prosecuted it with great care and diligence. The 1st volume appeared at Philadelphia in 1784, the 2d in Boston in 1791, and the 3d in that city in the following year. Not paying the expenses of publication, the legislature of New Hampshire granted him £50 in its aid. This work has long ranked at the head of the local histories of the country for its agreeable manner and historical fidelity. It shows, also, the power of a comprehensive and methodical thinker. In 1790 he projected the Massachusetts historical society, which has been followed by similar associations throughout the country. In 1792 he published, in successive numbers of the "Columbian Magazine," "The Foresters," an apologue after the manner of Arbuthnot's "John Bull," intended to represent the course of the history of the country, and particularly the formation and adoption of the federal constitution. It is done in a most humorous and agreeable style. The next year he published a life of Watts; in 1794, a series of American biographies; and, in 1795, the "Collection of Psalms and Hymns," for a long time in use in many of the New England churches, several of which were written by himself. He was also the author of many fugitive pieces, contributions to magazines, sermons, &c., printed at different periods of his life. A life of Dr. Belknap, by his granddaughter, with selections from his correspondence, was published in New York, in 1847.

BELKNAP, WILLIAM G., an American military officer, born in Newburg, N. Y., Nov. 14, 1794, died on the Washita river, Nov. 16, 1852. He was appointed 2d lieutenant in the 28d infantry, April 5, 1813; distinguished himself in the attack on Fort Erie, in Aug. 1814; was retained in service on the reduction of the army, in 1822, having been, in 1818, one of the assistant professors of tactics in the military academy. He became a captain in 1822, and was brevetted for faithful service, 10 years afterward. In 1842 he was appointed major of the 8d infantry, and, having served in Florida during the war, was made lieutenant-colonel by brevet. He served on the general staff at Buena Vista, was complimented in general orders, and received a sword of honor from the citizens of his own state, for his services in that battle. He also received the brevet of brigadier-general, having previously received that of colonel. From Dec. 1843, to May, 1851, he was in command of his regiment, and of the troops in the Cherokee nation (Arkansas). In May, 1851, he

was ordered to upper Texas, for the purpose of keeping the Indian tribes within the lines, and, while there, contracted a fever of which he died.

BELL, a hollow shaped metallic vessel, which, by its vibrations when struck, gives forth sounds; whence its name, from the old Saxon word *bellan*, to bawl or bellow. It is an instrument of great antiquity, being spoken of by the old Hebrew writers, as in Exodus xxviii., in which golden bells are prescribed as appendages to the dress of the high-priest, that notice may thus be given of his approach to the sanctuary. And at this day the bell is used for a similar purpose before the priest, in Catholic countries, as he proceeds to render the rite of extreme unction to the soul that is passing away; and so when the bell is tinkled, in administering the sacrament, by the same priest, it is in pursuance of a custom founded on the ancient Hebrew use of the bell. More intimately than any other instrument are bells associated with the religious and imaginative, as also with the most joyous and the saddest feelings of mankind. A quaint old writer describes their threefold duties thus:

To call the fold to church in time,  
We chime.  
When joy and mirth are on the wing,  
We ring.  
When we lament a departed soul,  
We toll.

By the Roman Catholics, bells are solemnly blessed, as they are consecrated to their holy work of summoning worshippers to their religious rites. From the circumstance of the bell receiving a name, and being washed with holy water, the ceremony is frequently called the baptism of bells. It is a mistake, however, to suppose that the form of baptism is used. There appears to be something poetical, and a little playful, in the custom of giving the bell sponsors, who are usually persons who have presented the bell to the church, or who contribute handsomely to the expense of purchasing it, at the time of the blessing. Chrism and oil are used in the ceremony of benediction, and in all the more solemn consecrations of utensils employed in the divine service. The consecration of bells dates back to a very early period. In Charlemagne's capitulary of 787, we find the prohibition "*ut cloccæ baptiscentur*;" and in the old liturgies of the Catholic church is a form of consecration directing the priests to wash the bell with water, anoint it with oil, and mark it with the sign of the cross, in the name of the Trinity. Names were given to bells as early as the year 963, when the great bell of the Lateran church was named by John XIII., for himself, John.—The ancient custom of ringing the passing bell, that those who heard it might pray for the soul that was leaving this world, appears to have given to the bell a mysterious connection with departed spirits; and the belief has extensively prevailed that the evil spirits, waiting to seize the stranger about entering their domain, are driven off in terror at its sound, and leave to the neophyte an entrance free and unobstructed. And when

"the curfew tolled the knell of parting day," a sadder influence was shed over the spirits of our fathers than was justified by the fact that this curfew bell was only a signal for all to put out their fires. According to some historians, this custom was introduced into Great Britain by William the Conqueror, though others date it back to the reign of the good king Alfred. The practice of ringing a bell at an early hour in the evening was not peculiar to England, for it prevailed to a considerable extent in various countries on the continent; as the buildings at this early period were mostly of wood, it was intended as a precaution against fires, which were then very common. The passing bell and the curfew bell are still represented in some New England villages; the one, as a funeral procession slowly wends its way to the graveyard, and the other, by the 9 o'clock bell, which hints the time for visiting to cease, and preparations to be made for bed—an hour later than in the time of William the Conqueror, it is true, but yet, in general, an hour or two too early, even for the quiet residents of New England towns.—As a signal to call the people together to join in any concerted action, the bell has been used from remote times; the feast of Osiris was announced by the ringing of bells, and the same sound to this day notifies to hungry mortals the time to join in satisfying the calls of their appetite. The Romans by bells announced the time for bathing; and the early Christians adopted the same signal for designating the hour of prayer, kept up by the Roman Catholic in the ringing of the *Angelus* at morning, noon, and night, at the sound of which all good Catholics join in this rite; and by the Protestant, in the church-going bell, which summons him to his devotion in the hour of prayer. In times of public danger, the bells were rung, and signal fires were burned to alarm the country; sometimes, also, they were employed to alarm the public enemy as well, under the impression, apparently, that they would be inspired with the same terror as the evil spirits waiting for their victim. In the year 610, when Clothaire II., king of France, besieged Sens, Lupus, the bishop of Orleans, ordered for this purpose the bells of St. Stephens to be rung; and as late as 1457, Calixtus III. employed the same device as a security against the dreaded Osmana, who considered bells their most dangerous foe; whence they were at this time called Turks' bells.—In our cities, alarm bells are rung to an extent our ancestors never dreamed of; and their sound, grown familiar to our ears, no longer inspires terror, as it calls the firemen to their constant duties. In the quaint old rhymes of the monks, and the songs of the poets, which commemorate the uses of the bell, this modern application of it is not alluded to. They tell us of the bell—

*Laudo Deum verum, plebem voco, congrego clerum,  
Defunctos ploro, pestem fugo, festa decoro.*

Schiller, however, in his celebrated "Song of the Bell," the motto of which is,

*Vivos voco, mortuos plango, fulgura frango,*

does not omit to notice this fear-inspiring sound. Indeed, in this beautiful poem, all the joys, sorrows, pangs, emotions, terrors, and blessings attendant on humanity, in connection with the part which the bell plays, are most vividly portrayed. Even the description of the various operations of mixing and fusing the alloy, and pouring the liquid metal into the mould prepared to give it its shape, are happily interwoven with all those uses which the bell is thereafter to serve. Each phase of the process suggests its appropriate phase of human life; and the story of the bell draws forth those admirable pictures of the infant presented at the baptismal font—of the maiden at the altar—of the sweet ministrations of maternity and home—of man's ambition, and woman's love—such as the hand of a master-workman alone can produce. The fire-bell is also well described by the American poet, Edgar A. Poe:

Hear the loud alarm bells—  
Brazen bells!  
What a tale of terror now their turbulency tells!  
In the startled ear of night,  
How they scream out their affright!  
Too much horrified to speak,  
They can only shriek, shriek,  
Out of tune,  
In a clamorous appealing to the mercy of the fire,  
In a mad exhortation with the deaf and frantic fire.

The use of the bells "*fulgura frangere*" is from the old belief, that as they served to alarm the spirits of the air, so those that rule the storm are frightened away, its power is broken, and the thunderbolt is averted.—Music bells are still in use in some parts of Europe. These are played by means of keys, not unlike those of a piano-forte. An old painting of King David represents him as playing, with a hammer in each hand, upon 5 bells, which were hung up before him. The music of the 88 bells which were suspended in the tower of the cathedral at Antwerp is highly celebrated. One of these bells was 7 feet wide, and 8 feet high. The Swiss bell-ringers, famous for their performances, produce the most exquisite melody from hand-bells. So skilful are they in the use of them, that they will change from one to another with almost the same rapidity as printers take up their types. The bells vary in size from a large cow-bell to the smallest dinner bell; and as many as 43 are often used by a company of 7 persons.—Bells were early introduced into almost all the countries of Europe. We find 8 golden bells, in an azure field, making the coat of arms of the imperial house of the Comneni, one of the most illustrious families that have occupied the Byzantine throne. About the year 400, bells were first used for churches by St. Paulinus, bishop of Nola, a city of Campania; and hence the names given to church bells in some of the European languages of *Nola* and *Campana*. In England and France they were in use as early as the 6th century, and the first parish churches appear to have been furnished with their campanile or bell-tower, which still continues to be

one of their distinguishing features. Several were used in a single church, as is still the custom, when arranged in chimes, or, as in Roman Catholic countries, without regard to harmony of tones. The church of the abbey of Croyland in England had one great bell named *Guthlac*, presented by the abbot Turketulus, who died about the year 870, and subsequently 6 others, presented by his successor, Egelric, and named Bartholomew and Betelin, Turketul and Tatwin, Bega and Pega. When all these were rung together, Ingulphus says, "*Fiebat mirabilis harmonia, nec erat tunc tanta consonantia campanarum in tota Anglia.*"—But Russia exceeds all other nations in its fondness for bells. In Moscow alone, before the revolution, there were no less than 1,706 large bells; in a single tower there were 37. One was so large that it required 24 men to ring it, and this was done by simply pulling the clapper. Its weight is estimated at 288,000 lbs. The great bell cast by order of the empress Anne, in 1658, and now lying broken upon the ground, is estimated to weigh 448,772 lbs.; it is 19 feet high, and measures around its margin 68 feet 11 inches. The value of the metal alone in this bell is estimated to amount to over \$300,000. Whether this bell was ever hung or not, authorities appear to differ. The following notice of the bells of Moscow, and of the great bell in particular, is from Clarke's Travels: "The numberless bells of Moscow continue to ring during the whole of Easter week, tinkling and tolling without harmony or order. The large bell near the cathedral is only used upon important occasions, and yields the finest and most solemn tone I ever heard. When it sounds, a deep hollow murmur vibrates all over Moscow, like the faintest tones of a vast organ, or the rolling of distant thunder. This bell is suspended in a tower called the belfry of St. Ivan, beneath others which, though of less size, are enormous. It is 40 ft. 9 in. in circumference, 16½ in. thick, and it weighs more than 57 tons. The great bell of Moscow, known to be the largest ever founded, is in a deep pit in the midst of the Kremlin. The history of its fall is a fable, and as writers continue to copy each other, the story continues to be propagated; the fact is, the bell remains where it was originally cast; it was never suspended. The Russians might as well attempt to suspend a first-rate line of battle ship with all its guns and stores. A fire took place in the Kremlin, the flames of which caught the building erected over the pit in which the bell yet remained; in consequence of this the metal became hot, and water thrown to extinguish the fire fell upon the bell, causing the fracture which has taken place.... The bell is truly a mountain of metal. They relate that it contains a very large proportion of gold and silver, for that while it was in fusion the nobles and the people cast in as votive offerings their plate and money.... I endeavored in vain to assay a small part. The natives regard it with superstitious veneration, and they would not

allow even a grain to be filed off; at the same time, it may be said, the compound has a white, shining appearance, unlike bell-metal in general, and perhaps its silvery appearance has strengthened, if not given rise to a conjecture respecting the richness of its materials. On festival days the peasants visit the bell as they would a church, considering it an act of devotion, and they cross themselves as they descend and ascend the steps leading to the bell." After Mr. Clarke's visit the czar Nicholas, in the year 1837, caused the great bell to be taken out of the deep pit in which it lay, and to be placed upon a granite pedestal. Upon its side is seen, over a border of flowers, the figure of the empress Anne in flowing robes. The bell has been consecrated as a chapel; and the door is in the aperture made by the piece which fell out. The size of the room is 22 ft. diameter, and 21 ft. 3 in. in height.—The bells of China rank next in size to those of Russia. In Pekin, it is stated by Father Le Compte, there are 7 bells, each weighing 120,000 lbs. Excepting the bells recently cast for the new houses of parliament, the largest of which weighs 14 tons, there is only 1 bell in England larger than that upon the city hall in New York city. It was cast in 1845 for York Minster, and weighs 27,000 lbs., and is only 7 feet 7 inches in diameter. The great Tom of Oxford weighs 17,000 lbs.; and the great Tom of Lincoln 12,000 lbs. The bell of St. Paul's in London is 9 feet diameter, and weighs 11,500 lbs. One placed in the cathedral of Paris, in 1680, weighs 88,000 lbs. Another in Vienna, cast in 1711, weighs 40,000 lbs.; and in Olmutz is another weighing about the same. The famous bell called Susanne of Erfurt is considered to be of the finest bell metal, containing the largest proportion of silver; its weight is about 80,000 lbs. It was cast in 1497. Luther, when a schoolboy, must have heard its earliest peals, and in later years have welcomed its sound at each return to Erfurt. At Montreal, Canada, is a larger bell than any in England. It was imported in 1843 for the Notre Dame cathedral. Its weight is 29,400 lbs. In the opposite tower of the cathedral is a chime of 10 bells, the heaviest of which weighs 6,043 lbs., and their aggregate weight is 21,800 lbs.—There are few bells of large size in the United States. The heaviest is the alarm bell on the city hall in New York. It was cast in Boston, and weighs about 23,000 lbs. Its diameter at mouth is about 8 feet; its height about 6 feet, and thickness at the point where the clapper strikes 6½ or 7 inches. The bell now on the hall of independence in Philadelphia, is celebrated as being connected with the ever memorable 4th of July, 1776, when it first announced by its peal the declaration then made, the most important event in the history of our country. It was imported from England in 1752, and owing to its being cracked on trial by a stroke of the clapper was recast in Philadelphia under the direction of Mr. Isaac Norris, to whom we are probably indebted for the following in-

scription, which surrounds the bell near the top, from Leviticus xxv. 10: "Proclaim liberty throughout all the land, unto all the inhabitants thereof." Immediately beneath this is added: "By order of the assembly of the province of Penn<sup>a</sup>. for the State House in Phil<sup>a</sup>." Under this again, "Pass & Stow, Phil<sup>a</sup>, MDCCLIII." In 1777, during the occupation of Philadelphia by the British, the bell was removed to Lancaster. After its return it was used as state house bell until the erection of the present steeple with its bell in 1828. Then it ceased to be used excepting on extraordinary occasions. Finally it was removed to its present appropriate resting-place in the hall of independence. Its last ringing, when it was unfortunately cracked, was in honor of the visit of Henry Clay to Philadelphia. There are no other bells of particular interest in this country. Those used upon the fire alarm towers in our cities are from 10,000 to 11,000 lbs. weight. They are hung in a fixed position and struck by a hammer, instead of being turned over.—Bells have been made of various metals. In France formerly iron was used, and in other parts of Europe brass was a common material. In Sheffield, England, the manufacture of cast-steel bells has been recently introduced; the material is said to have the advantages over the ordinary composition, of greater strength and less weight and cost. As the swinging of heavy bells often endangers the towers in which they are hung, it is of no little consequence to reduce as much as possible their weight. Steel bells are cast by pouring the contents of the steel pots into the bell mould instead of into the ordinary ingot moulds. Their tone is said to be harsh and disagreeable. Cast-steel drills, bent into the form of a triangle and suspended to a building or post, are much used in place of bells about mining establishments. Bell-metal is an alloy of copper and tin in no fixed proportion, but varying from 66 to 80 per cent. of copper, and the remainder tin. But other metals are also often introduced, as zinc, with the object of adding to the shrillness of the sound, silver to its softness, and also lead. Dr. Thompson found an English bell-metal to consist of copper 800 parts, tin 101, zinc 56, and lead 48. Cymbals and gongs contain 81 copper and 19 tin. Mr. Denison, who has charge of the founding of the new bells for the British houses of parliament, thinks the use of silver is entirely imaginary; and that there is no reason for believing it could be of any service. He condemns the use of all other materials but copper and tin, and advises that contracts for bells stipulate that the alloy shall consist of at least 90 per cent of tin, and the remainder copper. Three and a half to one is perhaps the best proportion. Much interesting information upon the qualities of the alloys and the forms of bells is contained in a paper recently presented by him to the royal institution of Great Britain. He regards the hemispherical form of modern bells as adapted only for giving a thin and poor sound,

suitable for house clocks and such uses, but entirely unfitted for the heavy, far-reaching, and pleasing tones required in large bells. The European process of casting bells is to make the mould in a depression in the sand floor of the foundry, piling up a hollow core of brickwork upon a solid foundation, within which a fire is kept burning to preserve the liquid metal, when poured around it, from too rapid cooling. The outer surface of the core is the shape of the inner surface of the bell. To give the outer surface, a cover of earthenware is fashioned to fit over the core, leaving between these a vacant space to be filled with the metal. This arrangement is deficient in not providing proper escape for the gases, which are engendered in heavy castings in the earth, and which are liable to cause the metal to be porous, or, being highly inflammable, to explode with great damage. An improved process has been introduced at Meneely's bell foundry at Troy, New York, consisting in the use of perforated iron cases, the outer one in the shape of the bell, and the inner one the core, which sets in the centre of its saucer-shaped foundation. Each of these receives a coating of loam, the outer one within, and the core around its outside; but over the latter is first wrapped a straw rope, which taking fire and burning slowly, as the metal is poured between the 2 cases, leaves a free space for the bell to contract in cooling without straining. The perforations through the cases let out the vapors, and also serve to keep the coating of loam in its place. As the gas escapes through these holes, it burns with a pale blue flame without risk, the whole apparatus being placed above the level of the ground. Flanges between the 2 cores keep them at the required distance from each other, in order to give the proper thickness of metal.—The best proportion of the height of a bell to its greatest diameter is said, by foreign authorities, to be as 12 to 15. In conformity to the laws of acoustics, the number of vibrations of a bell varies in inverse ratio with its diameter, or the cube root of its weight; so, for a series of bells forming a complete octave, the diameters should go on increasing with the depth of tone, as for *do*, 1; *re*,  $\frac{3}{4}$ ; *me*,  $\frac{2}{3}$ ; *fa*,  $\frac{1}{2}$ ; *sol*,  $\frac{1}{3}$ ; *la*,  $\frac{1}{4}$ ; *si*,  $\frac{1}{5}$ ; *do*,  $\frac{1}{6}$ .—A work on church bells, by the Rev. W. C. Lukis, appeared at London in 1857.

BELL, a central county of Texas, watered by Little river and its head streams the Leon and Lampasas. It has an area of about 850 square miles, a fine, rolling surface, and a soil consisting of sandy loam, well adapted to pasturage. Forests of cotton wood and live oak cover about  $\frac{1}{4}$  of the land. Pure water is abundant, and the climate generally healthy. The county was formed from Milam in 1850, and its increase from that period up to 1858 has been at least six-fold. Wheat and Indian corn are the staple productions. Value of real estate in 1857, \$596,300; value of horses and cattle, \$156,372; aggregate value of taxable property, \$1,265,110.

Capital, Cameron. Pop. in 1856, 4,481, of whom 560 were slaves.

BELL, ANDREW, a clergyman of the English church, who introduced into the English schools what was termed the system of mutual instruction, born at St. Andrew's, Scotland, in 1753, died at Cheltenham, England, Jan. 27, 1832. After studying in the university of his native town, he visited the colonies of America, and in 1789 went to India, where at Madras he became chaplain of Fort St. George, and engaged to instruct the orphan military asylum. He found in the mission schools of India a monitorial system, which on his return to England he explained in an elaborate treatise and proposed for adoption into English schools. The system consists in a division of the school into classes, and of the classes into pairs. The 2 members of a pair are each pupil and tutor of the other. Each class has a teacher and assistant teacher who assist the tutors, and a master, the only adult member of the system, has the general superintendence. It was not, however, till an analogous system had been introduced by the Quaker, Joseph Lancaster, into the schools of the dissenters, that Dr. Bell was authorized by the Anglican church to employ it in schools placed under his charge. He published several works upon educational subjects, and left all of his fortune for the endowment of various schools.

BELL, BENJAMIN, a Scotch surgeon, born at Edinburgh, died near the beginning of the present century. After studying in the principal universities of the continent, he became one of the surgeons of the royal infirmary at Edinburgh. He wrote several professional works, of which the most important is his "System of Surgery."

BELL, SIR CHARLES, a British surgeon and anatomist, born at Edinburgh, in Nov. 1774, died at Hallow Park, in Worcestershire, April 29, 1842. He began his education in the high school and university of his native city, and pursued his professional studies under his elder brother John, who was already distinguished as an anatomist and surgeon. He quickly gave evidence of his great talents, was admitted in 1799 to the college of surgeons, became at the same time one of the surgeons to the royal infirmary, and while still a youth delivered lectures before 100 pupils on the science of anatomy. He gave particular attention to dissections, which he illustrated by many careful drawings, some of which were published, and he eagerly availed himself of all the opportunities afforded by the infirmary for studying pathology and observing the diseased appearances when bodies were dissected, and in many cases he made representations of the morbid parts in models. Ambitious of a larger field of exertion, and weary of the dissensions which vexed the medical school of Edinburgh, he removed in 1806 to London, where he immediately began a course of lectures, became acquainted with Sir Astley Cooper, Abernethy, and other famous surgeons, and rapidly rose to distinction. He now published

his work on the "Anatomy of Expression," which he had written in Edinburgh, and which was designed to show the rationale of those muscular movements which follow and indicate the excitement of the various passions and emotions. The work attracted attention, being valuable to the physician, since it showed how the countenance often betrays the nature of the disease, and its value to the painter is seen in the fact that Wilkie carefully studied it while drawing the human figure, and Ruskin often refers to it in his criticisms. It is also interesting as having occasioned the author those investigations which led him to his great discovery concerning the nervous system. He published in 1807 his "System of Operative Surgery," a work, the practical character of which renders it still useful. Letters which he this year wrote to his brother announced his new doctrine of the nervous system, but he did not publish his views for many years. He supported himself unconnected with any medical schools till 1811, when he was invited to the Hunterian school, and 8 years later he was appointed surgeon to the Middlesex hospital, an institution which during the 22 years of his connection with it he raised to the highest repute both by his striking manner of lecturing and his great dexterity as an operator. Zealous in the practice of military surgery, he visited the fields of Corunna and Waterloo, immediately after the battles, and gave his services to the wounded. He made known to the public in 1821 his ideas on the nervous system in a paper in the "Philosophical Transactions." It immediately arrested the attention of anatomists throughout Europe, some of whom contested with him the priority of discovery; yet it was fully proved that Dr. Bell had taught the doctrine for many years to his pupils, had explained it in a pamphlet, a private edition only of which was printed, in 1810, and had clearly stated it in letters to his brother in 1807, when all of his rivals were teaching the old theory. The principle of the discovery is that no one nerve conveys both motion and sensation, carries both the impulses of volition from the brain and the impulses of the senses to the brain; but on the contrary, the nerves work only in one direction, one portion of them bearing messages from the body to the brain, and the other portion from the brain or will to the body. It had formerly been believed that both impulses might in some mysterious way be simultaneously and harmoniously communicated along the same chord. It was shown by Dr. Bell that the brain and spinal marrow are likewise divided into 2 parts, which minister respectively to the functions of motion and sensation; that those roots which join the back part of the spinal marrow are nerves of feeling, messengers from the senses, but incapable of moving the muscles, while those roots which have their origin in the front column of the spinal marrow and the adjacent portion of brain are nerves of voluntary motion, conveying only the mandates

of the will. He showed that though 8 distinct nerves may be bound together in a single sheath for convenience of distribution, they yet perform different functions in the physical economy, and have their roots divided at the junction with the brain. The nerves of the different senses are connected with distinct portions of the brain. Such is the outline of one of the greatest discoveries in physiology, and which entitles Bell to a glory equal to that of Harvey. As Harvey annihilated the theory of the flux and reflux of the blood through the same organs, and discovered the law of its circulation through the veins and arteries, so Bell distinguished the 2 classes and separate functions of the nerves. For this discovery he received a medal from the royal society of London, in 1829, and upon the accession of William IV. he was invested, in company with Brewster, Herschel, and others, with the honor of knighthood, in the new order then instituted. He was offered the senior chair of anatomy and surgery in the London college of physicians, where his lectures were attended both by pupils and practitioners, and where he attracted crowds by a series of discourses on the evidence of design in the anatomy of the human body. His reputation was great also upon the continent, and Cuvier expressed his admiration of his abilities and labors. He published about this time 2 essays, "On the Nervous Circle," and "On the Eye," having reference to the theory of a 6th sense, and a treatise on "Animal Mechanics," for the society for the diffusion of useful knowledge. Being invited to take part in the great argument published by the bequest of the earl of Bridgewater, he wrote the admirable treatise on "The Hand," and he soon after assisted Lord Brougham in illustrating Paley's "Natural Theology." In 1886 he accepted the chair of surgery in the Edinburgh university, and his lectures there were attended by the most eminent literary and scientific men in that capital. He afterward visited Italy, making many observations, with which he enriched a new edition of the "Anatomy of Expression;" he died soon after returning to England.

BELL, GEORGE JOSEPH, a Scotch lawyer and writer upon law, born at Fountainbridge, near Edinburgh, March 26, 1770, died in Edinburgh, Sept. 28, 1848. His first legal publication was a treatise on the laws of bankruptcy, which, in 1810, was enlarged and published under the title of "Commentaries on the Laws of Scotland." The third edition of this work, issued in 1816, gained for him the rare honor of a vote of thanks from the faculty of advocates. His subsequent works on the law of Scotland are standard text-books in the courts of that country, and are also referred to as authorities in England and America. Mr. Bell was at the head of 2 commissions for improving the administration of civil justice in Scotland, and from the year 1821 was professor in the university of Edinburgh. In 1881 he was appoint-

ed to one of the principal clerkships in the supreme court.

BELL, HENRY, steam navigator, born at Torphichen, near Linlithgow, Scotland, April 7, 1767, died March 14, 1830. A millwright by trade, he went to London when his apprenticeship expired, and while in Mr. Rennie's service, conceived the idea of propelling vessels by steam—ignorant, it would appear, of Millar's prior experiments, and of the fact that, nearly 8 years before, Robert Fulton had actually made a successful practical attempt on the Hudson. In 1811 Bell launched a boat on the Clyde, calling it the Comet, after the luminous appearance in the heavens during that year. He made a steam engine for this new craft, with his own hands, and the first trial of the boat took place on the Clyde, in January, 1812. Three-horse power was successfully applied at first, subsequently increased to 6. After numerous experiments and improvements, steam navigation was introduced into Scotland by Henry Bell. His first boat is preserved in the museum of Glasgow university. The city of Glasgow settled a small annuity on him, barely sufficient for his support, and the British government, not long ago, gave a small pension to his widow. A monument to his memory has been erected on the rock of Dunglass, a promontory on the Clyde, 2½ miles from Dumbarton.

BELL, JAMES, geographical writer, born at Jedburgh, in Scotland, 1769, died at Glasgow, 1838. Brought up as a weaver, he received the ordinary sound education which the very poorest can claim in Scotland. He became a manufacturer of cotton goods in Glasgow, and, being an indefatigable student, was an able teacher of the classics to young men preparing for the university. He was author of a well-arranged and copious "System of Popular and Scientific Geography," in 6 volumes, 8vo, which has been repeatedly reprinted; also of a "Gazetteer of England and Wales."

BELL, JOHN, Scottish traveller, born at Antermory, in the west of Scotland, 1691, died July 1, 1780. At the age of 23, he received the degree of M. D., and immediately after (July, 1714) was induced to repair to St. Petersburg, where Peter the Great received him kindly, and allowed him to be engaged as surgeon to an embassy about to proceed to Persia. Leaving St. Petersburg in July, 1715, he did not reach Ispahan, where the shah held his court, until March, 1717. He returned to St. Petersburg on the last day of 1718. His desire of adventure unabated, he departed in July, 1719, attached to an embassy to China, through Moscow, Siberia, and the great Tartar deserts, to the great wall of China, not reaching Peking until November, 1720—the journey occupying 16 months. He resided half a year in Peking, and arrived at Moscow early in Jan. 1722. The czar having made him his chief physician, he joined in the expedition headed by Peter himself, to assist the shah of Persia in routing the rebel Afghans, and returned

with him. Soon after he revisited Scotland, but was at St. Petersburg in Dec. 1787, when, negotiations for peace between Russia and Turkey having failed, Dr. Bell was sent to Constantinople with new proposals, and returned to St. Petersburg in May, 1788, but finally settled as a merchant in Constantinople, where he married in 1746, and soon after returned to Scotland, fixing his residence on his estate of Antermory, in very affluent circumstances, and very popular from his benevolence and sociality. He did not publish any record of his wanderings until 1768, when his "Travels in Asia" appeared in 2 vols. 4to. This work, which has passed through several editions, has had large circulation throughout Europe by means of a French translation. Though not acquainted with the travels of Marco Polo, the Venetian, Dr. Bell confirms many of his marvellous relations. His own account of his residence in Pekin, is described as "one of the best and most interesting relations ever written by any traveller."

BELL, JOHN, an English farmer, remarkable for his longevity, born in 1747, died at Hexham, county of Northumberland, in 1857. He was below the middle size, slender and wiry-looking, and was distinguished during the whole course of his life for his temperance, frugality, and industry. He married in early life, and at the time of his death he had 8 children (2 had died), 41 grandchildren, 60 great-grandchildren, and 2 great-great-grandchildren.

BELL, JOHN, Scottish surgeon, born at Edinburgh, May 12, 1768, died at Rome, April 15, 1820, studied for his profession at the medical schools of his native city. On taking his diploma and commencing practice, he opened a private school of anatomy, and gave lectures with the view of inculcating the necessity of a knowledge of anatomy on surgical practitioners. At this time, incredible and inconsistent as it may now appear, anatomy was very imperfectly studied by surgeons, although it formed part of the physician's preparatory professional studies. Private teaching and private dissections were also novelties, and Mr. Bell's ideas gave great offence to the established Gamaliels, who considered them innovations and a slur upon their competency. Notwithstanding an active opposition, his merits secured him a large class of pupils, and enabled him to introduce his own enlarged views of professional requirements to public notice. His career as a teacher was, however, cut short by the determined opposition of his rivals, who managed to exclude him and his class from the public infirmary, in which he had been accustomed to practise gratuitously for the benefit of the poor, taking advantage of the field thus open to him to instruct his pupils. On this, he gave up his lectures and demonstrations, and addressed himself to private practice only. He passed the last 3 years of his life in Italy for the benefit of his health. His works were: "Anatomy," afterward completed by his brother, Sir Charles Bell; "Discourses on the Na-

ture and Cure of Wounds," 2 vols. 8vo; "The Principles of Surgery," 3 vols. 4to. Beside these, he wrote letters on professional education, and a posthumous work on Italy.

BELL, JOHN, an American statesman, born near Nashville, Tenn., Feb. 18, 1797. He was the son of a farmer in moderate circumstances, who was, however, able to give him a good education at Cumberland college, now Nashville university. Choosing the law as his profession, he was admitted to the bar in 1816, settled at Franklin, Williamson county, and was elected to the state senate in 1817, when only 20 years old. He soon saw his error in entering so early into public life, and declining a reflection, devoted himself for the next 9 years to his profession. In 1826 he became a candidate for congress against Felix Grundy, one of the most popular men in the state, and who had the powerful support of Andrew Jackson, then a candidate for the presidency against John Quincy Adams. Nevertheless, after a most animated and excited canvass of 12 months, Mr. Bell was elected in 1827, by 1,000 majority. By successive elections, he continued a member of the house of representatives for 14 years. He entered congress a warm admirer of Mr. Calhoun, and strongly opposed to the protective system, against which he made a speech in 1832. Subsequent investigation and reflection induced him to change his opinions on that subject, and he has ever since remained an earnest advocate of the policy of protecting American industry. Though opposed to the appropriation of money by the general government for roads and canals in the states, except in the case of some great road for military purposes like the Pacific railroad, he has always favored the policy of improving the great rivers and lake harbors. With all his admiration for Mr. Calhoun, Mr. Bell decidedly opposed the South Carolina doctrine of nullification, and was made chairman of the judiciary committee of the house with special reference to the questions connected with that subject which might have to be considered and reported on. For 10 years he was chairman of the committee on Indian affairs. He was in favor of a United States bank, though he voted against the bill for its recharter in 1832, because he believed that the subject was brought up at that time, 4 years before the expiration of the old charter, merely to defeat Gen. Jackson in the ensuing presidential election; and because he was convinced the president would veto the bill, which proved to be the case. He protested against the removal of the deposits, and refused to vote for a resolution approving that measure. This refusal was one of the causes which led to the subsequent breach between himself and President Jackson and the democratic party, and finally to his cooperation with the whigs. This change of party relations was much accelerated by his election to the speakership of the house of representatives in 1834. In June of that year, the speaker, Mr. Stevenson, resigned the chair upon being nominated minister to

Great Britain, and Mr. Bell was elected to succeed him in opposition to James K. Polk, afterward president of the United States, who was the candidate of the administration and of the democratic party. Mr. Bell was supported by the whigs and by a portion of the democratic party who were opposed to the intended nomination of Martin Van Buren as successor to President Jackson. The principal ground of Mr. Bell's opposition to Mr. Van Buren was his strong disapproval of the system of removals from subordinate offices for merely political reasons—a system which Mr. Van Buren had zealously promoted in the party conflicts of the state of New York, and which it was supposed he intended to carry out to its full extent in the administration of the federal government. The tendencies of such a use of executive patronage had been vividly portrayed by Mr. Bell in a speech in the house on the freedom of elections; and he had made repeated, though ineffectual, efforts in successive congresses to procure the enactment of laws calculated to check the policy. The final separation between Mr. Bell and Gen. Jackson took place in 1835, when Mr. Bell declared himself in favor of Judge White for the presidency, in opposition to Mr. Van Buren. Up to that time there had been no opposition in Tennessee to Gen. Jackson's administration, and it was generally supposed that his personal and political influence could not fail to subdue the opposition raised by Judge White and his friends. The whole force of the administration, and of Jackson's personal popularity, was exerted to this end. But Judge White carried the state by a large majority; Mr. Bell was reelected to congress from the Hermitage district itself by as great a vote as ever; and an impulse was given to the political character of Tennessee which arrayed it in opposition to the democracy during the four succeeding presidential elections of 1840-'44-'48-'52. When the reception of petitions for the abolition of slavery in the district of Columbia was agitated in the house of representatives in 1836, Mr. Bell alone of the Tennessee delegation favored their reception, and though assailed at home, was sustained by the people. And subsequently, in 1838, when Atherton's resolutions were introduced, proposing to receive and lay these petitions on the table, he maintained his consistency by voting in the negative, in order that they might be referred and reported upon. When President Harrison formed his administration in 1841, he invited Mr. Bell to accept the war department, which he did. With the rest of the cabinet, Mr. Webster only excepted, he resigned office on the separation of President Tyler from the whig party, in the autumn of that year. The whig majority in the next Tennessee legislature which met after his withdrawal from the cabinet offered him the office of United States senator, which, however, he declined in favor of Ephraim H. Foster, who had rendered services to the whig party which Mr. Bell thought deserving that recognition. Mr. Foster

was accordingly elected, and Mr. Bell remained in voluntary retirement until called by the people of his county, in 1847, to represent them in the state senate; in which year, on the occurrence of a vacancy, he was elected to the United States senate, to which he was reelected in 1853 for his present term of service, which will expire March 4, 1859.—In the senate Mr. Bell has steadfastly opposed the policy of annexing Mexico and other Spanish-American states to the union. He was in favor of the compromise measures of 1850, but desired to see the issues then made fully settled at the time by the division of Texas into states, as provided by the act of annexation, because he apprehended, whenever that question came up, the harmony of the union might be again disturbed. In 1854, when the Nebraska bill was presented to the senate, Mr. Bell protested against its passing, as a violation of the Missouri compact, as unsettling the principles established by the compromise of 1850, and as reopening a sectional controversy which might imperil the peace and safety of the union. In the controversy on the admission of Kansas, in March, 1858, Mr. Bell took decided ground against the so-called Lecompton constitution, and made an elaborate speech, charging that that measure tended directly to the overthrow of the union.

BELL, JOHN, British sculptor, born in Norfolk in 1800. After having followed the routine of the antique school, as it is called, he devoted himself to subjects from the Scriptures, and from modern literature. Thence came his "John the Baptist," "David with the sling," the "Madonna and Child," &c. For the new houses of parliament, Mr. Bell has executed historical portraits of Shakespeare, Lord Falkland, and Sir Robert Walpole. Mr. Bell has worked a good deal for decorative manufacturers.

BELL, LUTHER V., M. D., LL. D., an American physician, born at Chester, N. H., Dec. 20, 1806, son of the late Gov. Samuel Bell, of that state. He entered Bowdoin college at the age of 12, and graduated with distinction in 1821, before he had completed his 16th year. He commenced the study of medicine with an elder brother in the city of New York, and received his degree from the Hanover medical school while yet under 20, and commenced practice in New York. His friends afterward urged his return to New Hampshire and he established himself in his native town. He soon achieved distinction, particularly in surgery. One of his earlier operations, the amputation of the femur, was performed, in default of any other accessible instruments, with the patient's razor, a tenor saw, and a darning needle for a tenaculum, and the patient had a speedy recovery. Dr. Bell early acquired reputation from his ability as a writer on medical subjects. For 2 years in succession, while still under 30 years of age, he won the Cambridge Boylston prize medal by medical essays of such merit, that they still form a part of the standard medical literature of the country. It was about this period that

the success of the state lunatic hospital at Worcester, Mass., began to attract the attention of the philanthropists in New Hampshire to the necessity of a similar institution in their own state. Dr. Bell devoted himself with great zeal to the promotion of this enterprise. Twice he was elected to the legislature for the defence of his favorite plan, but, though his efforts were not immediately successful, the ability he had displayed in the discussion of the subject, led to his election, entirely without his knowledge, to the superintendency of the McLean insane asylum, at Charlestown, Mass. He entered upon his duties in Jan. 1837, and for nearly 20 years conducted the institution with rare ability and success. In 1845, the trustees of the Butler hospital for the insane at Providence, R. I., procured his services to visit Europe, and ascertain what improvements had there been made in the construction and ventilation of insane hospitals. His absence of only three months was devoted entirely to the work assigned him, and on arriving at New York, he had already completed plans for the construction of a hospital, which, for its size, has no superior in the country in its adaptation. Within the last few years, Dr. Bell has mingled somewhat in political life. He has been one of the executive council of Massachusetts; a member of the constitutional convention of 1852; the nominee of his party for congress, and for the governorship. In 1856 he resigned his position as superintendent of the McLean asylum.

BELL, ROBERT, an Irish man of letters, born at Cork, Jan. 10, 1800. After receiving his education at Dublin, he followed successively a military and a civil career, but quickly abandoned both for literary occupations. He published articles in a Dublin magazine, and wrote 2 comedies, the "Double Disguise," and "Comic Lectures," which were successfully produced upon the stage. He went to London, where he contributed a series of "Reminiscences" to the "New Monthly Magazine," and wrote for the weekly "Atlas," which was one of the chief mingled literary and political journals published in London. One of his articles in the latter paper having provoked Lord Lyndhurst to bring a suit against him, he conducted his own defence, and was acquitted. He wrote, for Lardner's "Cabinet Cyclopædia," the "History of Russia," and the "Lives of the English Poets;" and he was the author of the last volume both of Southey's "Naval History of England" and of Mackintosh's "History of England." He founded in 1840, in connection with Bulwer and Lardner, the "Monthly Chronicle," to which he was a principal contributor. He has written several theatrical pieces, among which are "Marriage," "Mothers and Daughters," and "Temper," and has also published a "Life of Canning," "Outlines of China," "Memorials of the Civil War," "Wayside Pictures through France, Belgium, and Holland," and the "Ladder of Gold." Mr. Bell is of an amiable char-

acter, and though he has written many criticisms he has made few enemies.

BELL, SAMUEL, an American statesman, born at Londonderry, N. H., Feb. 9, 1770, died at Chester, Dec. 23, 1850. He passed his boyhood upon his father's farm, graduated at Dartmouth college in 1793, and was admitted to practise law in 1796. He rapidly achieved distinction in his profession, and in 1804 was elected a representative to the state legislature, an office to which he was twice reelected; and during his last 2 terms he held the position of speaker of the house. He declined the attorney-generalship in 1807, after which he was successively a member of the state senate, and of the executive council, a judge of the supreme court, and in 1819 governor of the state. To the latter office he was reelected 4 times in succession, till in 1823 he was elected to the senate of the United States, an office to which he was also reelected. He retired from public life upon the expiration of his second term in 1835, and upon a farm in Chester devoted himself to rural and literary pursuits, and enjoyed the society of his family and friends.

BELL, THOMAS, an English naturalist, born at Poole, in Dorsetshire, Oct. 11, 1793. His favorite study from boyhood was natural history, and at an early age he became a member of the London college of surgeons, and of the Linnæan society. In 1817 he began a course of lectures in Guy's hospital, where he had been for 3 years a student, and where he has continued to lecture either upon natural history or comparative anatomy to the present time. He was one of the founders of the "Zoological Journal," and one of the earliest fellows of the geological and zoological societies. In 1827 he communicated to the "Philosophical Transactions" a paper on the use of the submaxillary gland in the genus *crocodilus*, suggesting that the gland being odoriferous had the effect of attracting toward it small fish, which became the animal's prey. The next year he was elected a fellow of the royal society, and in 1836 he became professor of zoology in King's college. He was a long time secretary of the royal society, and has been president of the Linnæan society since 1853, and of the Ray society from its establishment. He has written largely upon his favorite science, having published, beside many papers in the transactions of learned societies, histories of British quadrupeds and reptiles, and treatises on the *testudinata*, and on the British stalk-eyed *crustacea*.

BELL ROCK, or INCH CAPE, a dangerous reef of rocks in the German ocean, off the E. coast of Scotland, nearly opposite the mouth of the river Tay; lat. 56° 26' N., long. 3° 23' W. During high tide it is entirely covered by the sea. The reef is about 850 yards in length, and 110 in breadth. A light-house is erected upon it. The light is 108 feet above the medium level of the sea. A bright and red light are exhibited every four minutes. Upon the rock there are also 2 bells, which in

thick foggy weather are tolled by machinery night and day, at intervals of half a minute. Prior to the erection of these bells this rock was the cause of many shipwrecks.

**BELL TOWN**, a large town on the Cameroons river, in Guinea. It is the residence of a native chief, and is accessible by merchant vessels, which anchor in the Cameroons river, close to the town. The houses are regularly and neatly built of bamboo.

**BELLAC**, a town in the department of Haute-Belle, Vienne, France; pop. 4,000. It has tanneries, paper-mills, and a foundry, cloth, linen, and hat manufactories.

**BELLADONNA**, literally, beautiful lady, a name given to several different plants, as to the *atropia hortensis*, *amaryllis belladonna*, and the *atropa belladonna*. The amaryllis is a lily of great beauty and blushing appearance. It grows wild at the Cape of Good Hope, and is well known in cultivated gardens in England and France. The name is also in common use for the medicinal extract of the atropa, and in the pharmacopœias for the leaves, and also for the root and leaves, from which the extract is obtained. This is a plant of the *solanaceæ* family, the qualities of which are better described by the name of Atropa, one of the Fates, whose office was to clip the thread of life, than by the specific name of belladonna, notwithstanding from it the Italians extracted a cosmetic for preserving the freshness of the skin. It is known by the common name of deadly nightshade. In England, Germany, and northern France, it is met with in shady places along the sides of the walls, flowering in June and July, and ripening its fruit in September. In this country it is successfully cultivated in gardens. It grows from 3 to 4 feet in height, with straight and strong stems. The leaves, of oval shape and pointed, are in pairs of unequal size; the flowers are large, bell-shaped, and of a dull violet-brown color. The fruit resembles a cherry, for which it is sometimes mistaken by children, with fatal consequences: it contains numerous seeds, and yields a violet-colored juice, of sweetish taste. All parts of the plant are highly poisonous. The leaves are most usually employed for the extraction of the alkaloid principle, though the root and berries also yield it to alcohol and water. For description of this substance, see **ATROPIA**. The juicy extract of the leaves expressed by trituration, and mixed with water, is the common medicinal preparation, known by the name of belladonna in this country; by the Dublin medical college the root is also used for the preparation. This extract is preferred to the alkali on account of the dangerously powerful properties of the latter. It is estimated that one hundred weight of fresh leaves will yield from four to six pounds of extract. It has been employed in medicine from early times, the leaves themselves being applied to heal tumors and ulcers. At present it is administered internally in preference, and is found to

be a powerful remedy in nervous diseases, neuralgia, hooping-cough, paralysis, rheumatism, and many other diseases. By the homœopaths it is highly esteemed as a preventive medicine to attacks of scarlatina. It has a powerful effect upon the eye, a few drops causing dilatation of the pupil, a property which renders it a highly useful application previous to the operation for the cataract. Dilatation usually comes on in about an hour; and increases for 3 or 4 hours, after which it continues for a day or two. It is also applied in cases of inflammation of the iris and opacity of the crystalline lens. The poisonous effects of the plant when taken by mistake, which is not an uncommon occurrence where it grows wild, are described as very distressing and terrible. They commence in about half an hour; but when the alkali is taken, in fifteen minutes. The throat becomes dry and parched, the power of swallowing is lost, nausea and ineffectual attempts to vomit succeed, the sight becomes dim, and the sufferer is thrown into a condition of vertigo and delirium like that of intoxication, making wild gestures, and uttering shouts of laughter, and at last falling into a state of lethargy. The pupil of the eye is dilated and sightless, the face red and swollen, and the mouth and jaws spasmodically affected. The most effectual antidote is the speedy use of the stomach-pump or emetics, followed by purgatives and injection. The infusion of galls is also recommended, and lime-water or the alkaline solutions are said to render the poisonous matter remaining in the stomach inert.

**BELLAMONT, RICHARD**, earl of, royal governor of New York and Massachusetts, to which offices he was appointed in May, 1695, but did not arrive in New York until May, 1698. He died in New York, March 5, 1701. He went from New York to Boston in May, 1699, and was received by 20 companies of soldiers and a vast concourse of people. He took every means to ingratiate himself with the people, and one of his biographies says by this means he obtained a larger salary than any of his predecessors had been able to get. Though but 14 months in the colony, the grants made to him were £1,875. His administration was uneventful, his time having been occupied in the pursuit of the pirates who infested the coast, one of whom, the notorious Kidd, he secured and sent to England in 1700. In the latter part of that year he returned to New York, where he contracted the disease of which he died. Hutchinson speaks of Bellamont as being a hypocrite in a pretended devotion to religion. It appears, however, that while living at Fort George, in New York, he passed much time in meditation and contrition for his youthful excesses. He was accompanied to America by his countess. New Hampshire he does not appear to have visited, though it was one of his governments.

**BELLAMY, MRS. GEORGE ANN**, English actress, born in London, April 23, 1733, died

at Edinburgh, Feb. 15, 1788. Her mother, who had been Lord Tyrawley's mistress, married Capt. Bellamy, who abandoned her on the birth of this child, which was born some months too soon to claim consanguinity with him. She was educated at a convent in Boulogne, from the age of 4 to 11, when she returned to England. Lord Tyrawley, her actual father, took notice of her, gave her a house near London, and introduced her to his own gay friends, whose conversation and example vitiated her mind. When Lord Tyrawley went on an embassy to Russia, he left her under the protection of a lady of rank, with an annuity of £100, so long as she held no intercourse with her mother, who had seriously offended him. Having gone to reside with her mother, she lost her annuity, and was renounced by her father. Having derived an inclination for the stage from her mother, who was an actress, she was introduced to Mr. Rich, manager of Covent Garden theatre, who, on hearing her recite some passages in Othello, engaged her as a performer. At this time she was 14, with a good figure, fine voice, graceful action, lively spirits, and handsome face. She appeared as Monimia, in the tragedy of "The Orphan," and her performance during 8 acts was dull and spiritless. In the 4th act (to use her own words) she "blazed out at once in meridian splendor." From that time her professional career was brilliant. In 1759, when Dodgley's "Cleone" was produced, Dr. Johnson attended, and wrote to Bennet Langton that it "was well acted by all the company, but Bellamy left nothing to be desired." After many alternations of fortune, a free benefit, given her by the players, in 1785, took her out of prison, to which she was remanded, for debt, in the following year. She died in want. She published an "Apology for her Life," in 6 volumes.

BELLAMY, JACOBUS, a poet of Holland, born at Flushing, Nov. 12, 1757, died March 11, 1786. He was bred in the trade of a baker, but his patriotic productions were so much admired that he was placed by a company of gentlemen at Utrecht, for education and to be provided for in the church; his genius, however, led him to continued poetical composition, imaginative and amatory. The *Vaderlandsche Gesangen* were collected and published in 1785.

BELLAMY, JOSEPH, D. D., a celebrated divine of New England, born in 1719, died March 6, 1790. He graduated at Yale college in 1735, and was ordained at Bethlehem, in Woodbury, Ct., in 1740. He remained in studious retirement until the famous revival of 1742, when, leaving his charge, he began, in the manner of the time, a constant and extensive course of preaching. A more than ordinary share of controversial learning, direct conviction, a ready delivery, and powerful voice, peculiarly fitted him for this office. After the religious interest had passed over, he returned to his parish and established a school of theological instruction, in which for many

years he educated numbers of attached pupils in the theory and practice of the ministry. Several sermons and treatises were published by him from 1750 to 1762, which, in 1811, were collected in 8 volumes, with a sketch of his life. His system of divinity coincides generally with that of President Edwards, with whom he was intimate.

BELLAMY, SAMUEL, a noted pirate, was wrecked in his ship, the *Whidah*, of 23 guns and 180 men, off Wellfleet, on Cape Cod, in April, 1717, after having captured several vessels on the coast. Only 1 Indian and 1 Englishman escaped of his crew. Six of the pirates, who had been run ashore when drunk a few days previous, by the captain of a captured vessel, were hung in Boston in Nov. 1717.

BELLARMIN (BELLARMINO ROBERTO), cardinal, born of a noble family at Monte Pulciano, near Florence, Oct. 5, 1542, died at Rome, Sept. 17, 1621. He was the nephew of Pope Marcellus II., and manifested the bright promise of his future greatness in childhood. It is said that once, when his mother took him to a church ornamented with paintings, representing the fathers and doctors of the church, he exclaimed, "One day I shall be one of these." Great care was taken with his early education, and at 18 he entered the society of the Jesuits. For several years he was occupied chiefly with study and instruction. The celebrated St. Francis Borgia, formerly duke of Candia, who succeeded Laynez as general, sent him to Louvain, to labor against the extension of Protestantism, by preaching and teaching theology. From this time, he became the most powerful and celebrated champion and controversial writer of the Roman Catholic church. Sixtus V. sent him with his legate to France, during the wars of the league, and after his recall he was employed in different offices at Rome. Clement VIII. decorated him with the Roman purple in 1599. During his brilliant career as the first theologian of the church, and as cardinal, Bellarmine continued to live a most simple, strict, and ascetic life. In 1603 he was made archbishop of Capua, where he resided and administered that see for a few years, after which he resigned it, and remained at Rome during the last 15 years of his life, wholly devoted to his duties as cardinal, and to the study of theology. At the conclave which followed the death of Clement VIII., he was a candidate for the tiara, and, at the subsequent conclave after the short reign of Leo XI., came within a few votes of the number requisite for an election. He exerted himself, however, to prevent it, and Cardinal Aldobrandini did the same, on the ground that the election of a Jesuit would offend the sovereigns. Cardinal Bellarmine remained, however, during his life, the most esteemed counsellor of the popes, and the ruling spirit of the college of cardinals.

BELLATRIX, the name of the smaller of the

2 bright stars in the shoulder of Orion. It is of the second magnitude. The name, Warrior-ess, is indicative of the supposed qualities of the spirit animating the star.

BELLAY, JOACHIM DU, a French poet, canon of Notre Dame of Paris, born near Angers, in 1524, died Jan. 1, 1560. He was a favorite with Francis I., with the queen of Navarre, and with Henry II. Though a priest, the license of the times allowed him to devote himself to a lady named Olive, on whom he wrote a collection of 115 sonnets, bearing her name, which he called his canticles. They were very successful. Du Bellay was called the French Ovid; and when afterward he published 188 sonnets entitled *Regrets*, and 47 on the antiquities of Rome, the public admiration extended across the channel, and was shared by the English Spenser. His contemporary Ronsard being known as the *prince de l'ode*, Du Bellay was spoken of as the *prince du sonnet*.

BELLE, JEAN FRANÇOIS JOSEPH DE, a French general, born at Voreppe, May 27, 1767, died in St. Domingo in June, 1802. He was made general in 1795; was in the Italian campaign of 1799, and on the fatal day of Novi, when, Joubert having fallen, the French army was forced to retreat, he directed the artillery. In 1801 he was in the army which sailed under command of Leclerc to reduce St. Domingo; he participated in the action which compelled Maurepas to capitulate; he soon after attacked the army of Dessalines, forced him to retreat, and pursued the fugitives into the fort of Orète-à-Pierrot. Many of the French perished under the artillery of this fortification, and De Belle himself, while advancing at the head of his column, was dangerously wounded, obliged to be carried from the field of battle, and survived but a short time.

BELLEHASSE, a county in the eastern part of Canada East, situated between the St. Lawrence and the state of Maine, and embracing an area of 1,088 sq. miles. Flax, hay, and oats are raised in considerable quantities, and the sugar-maple abounds in the forests. Woolen goods and leather are the chief manufactures. Pop. 17,982. Chief town, Berthier-en-bas.

BELLE-ISLE, or BELLISLE, STRAITS OF, an outlet of the gulf of St. Lawrence, between the coasts of Labrador and Newfoundland, lat. 52° N.; length, about 80 miles; breadth, 12 miles. Its navigation is considered to be hazardous. The Labrador side of this strait is indented with bays—Temple bay, Wreck cove, Green bay, Red bay, and Black bay. The opposite coast is devoid of indentations.

BELLE-ISLE, NORTH, an island at the mouth of the straits of the same name, between New Britain and the northern extremity of Newfoundland, 16 miles distant from the nearest part of the coast of Labrador. Its circumference is about 21 miles. On the N. W. side is a harbor for small fishing vessels, and a cove on the E. side affords shelter for shallops.—SOUTH

BELLE-ISLE is an island off the N. E. coast of Newfoundland, near the entrance to White bay.

BELLE-ISLE-EN-MER, an island in the bay of Biscay on the west coast of France, a little north-west of the mouth of the Loire, department of Morbihan, 8 ms. S. of Quiberon point. It is of an oblong form; length, about 11 miles; breadth, 6 miles. Its surface is about 160 feet above the sea, and treeless. The island is noted for its fine breed of draught horses. It has several druidical monuments. Pop. 10,000.

BELLENDEN, SIR JOHN, a Scotch statesman, born near the beginning of the 16th century, died in 1577. The name of his family is also spelled Ballenden and Bannatyne. The fact that he was a doctor of the Sorbonne makes it probable that he was educated in France. When the earl of Angus, prime minister of Scotland, was attainted in 1528, Ballenden was one of the few who adhered faithfully to him, and he drew up the defence, on the grounds taken in which the attainder was afterward reversed. He received the honor of knighthood in 1547, when he was made lord of sessions and director of the chancery, and upon the arrival of Queen Mary in Scotland in 1561 he was appointed one of the privy council. A zealous Catholic, he was one of those who sought to check the reformation by allowing smaller stipends to the Protestant clergy. He was involved in the commotions attending the murder of Rizzio, but obtained the favor of Mary and Darnley, and afterward joined the association against them. The troubles of the kingdom induced him to leave it for a time, and he made a visit to Rome, but returned and took part, 1573, in framing the pacification of Perth. He wrote a few poems, and translated into the vernacular tongue the Scottish history of Boethius.

BELLENDEN, WILLIAM, a Scottish writer of the 17th century, the time of whose birth and death is uncertain. He is famous for pure Latin-ity, and was educated at Paris, where he became professor of belles-lettres, and continued to reside, though he was invited to Scotland by James I. before the latter succeeded to the English crown. He collected in 1616 three treatises, which he had published before separately, under the title of *Bellendenus de Statu*. The first of these was entitled *Ciceronis Principes*, &c., or *De Statu Principis et Imperii*; the second was *Ciceronis Consul, Senator, Senatusque Romanus*, or *De Statu Reipublicæ*; and the third was *De Statu Prisci Orbis*. In the first 2 portions he collected from the writings of Cicero all the passages which had reference to the nature of political government, the authority of consuls, and the constitution of the senate among the Romans, and the last portion was a condensed history of the progress of religion, philosophy, and civil polity from the times before the flood, under the Hebrews, Greeks, and Romans, to the age of Cicero. This work was republished in 1787 by

Dr. Parr, who prefixed to it a long introduction in a style of elegant and powerful Latinity which could be equalled by few modern scholars, and which was remarkable for its fierce invective against eminent contemporary statesmen. The greatest labor of his life was an elaborate and learned work, *De tribus Luminibus Romanorum*, in which he designed to treat of the character, literary merits, and philosophical opinions of Cicero, Seneca, and Pliny. Only the first part was finished, in which he combines in a historical form all the statements and reflections of Cicero which relate to the civil and religious affairs of Rome; and he intersperses observations in such a way as to make the whole a careful display of the original sources of Roman history from the foundation of the city to the beginning of the empire. This work was precisely such a digest as Dr. Middleton in his "Life of Cicero" professed to have formed by his own unaided industry. But few copies of Bellenden's work existed in England, yet it is hardly probable that so well read a scholar as Middleton, who was familiar with public libraries, could have avoided seeing it, and therefore knowing that his own labor of collecting and digesting would be entirely superfluous. Dr. Middleton was, therefore, repeatedly accused of plagiarism, among others by Dr. Warton and Dr. Parr.

BELLEROPHON, a hero of Grecian mythology, whose real name was Hipponous, was a son of Glaucus, king of Corinth, and Eurymede. He received the eponym of Bellerophon in consequence of having slain a Corinthian eunatrid named Bellerus. After this crime he fled to Proetus, king of Argos, to get himself cleansed from the pollution of blood. The wife of Proetus became desperately enamored of him, but Bellerophon received her advances so coldly that she grew exasperated, and, accusing him to her husband of having made insulting offers to her, she insisted that he should be put to death. Proetus not wishing to violate the laws of hospitality by slaying a man who was his guest, despatched him with a letter to Iobates, king of Lycia, in which that potentate was charged to have Bellerophon killed. Iobates hereupon sent him to combat the monster Chimæra. Bellerophon first caught the winged horse, Pegasus, with the aid of Minerva, and then mounting him, soared into the air and slew the monster from on high. Iobates next sent him to encounter the Solymi and the Amazons, but the hero still proved victorious. Lastly, Iobates placed a band of the bravest Lycians in ambush to attack him on his return. This device, however, was fruitless, for Bellerophon slew them all. The Lycian monarch now perceiving that he was invincible, revealed to him the contents of the letter which he had brought from Proetus, gave him his daughter Cassandra in marriage, and made him heir to the throne of his kingdom. The latter days of Bellerophon were unfortunate. Attempting to soar to heaven on the back of Pe-

gasus, Zeus sent a hornet which so stung his winged steed, that he cast his rider to the earth, where lame and blind he wandered lonely in the Aleian fields, a prey to corroding grief and melancholy, shunning men, and hated by the gods.

BELLES-LETTRES (Fr.), beautiful or polite literature, a term of mediæval origin and vague import. Letters were revived in the fantastic age of chivalry, and the knights and princes of that time looked upon learning with something of the hallucination with which they regarded women, adventures, the Turks, and the dragon. Of science or of erudition they had no proper conception, and they thought that the whole array of learning, history, philosophy, mathematics, languages, geography, and astronomy, was designed only as an aid in writing a sonnet or a song. Literature was thus associated with the wild romance of the period, and the romantic epithet of beautiful, then much in vogue, was applied to it, making it in Italian *belle lettere*, and in French *belles lettres*. Ecclesiastical learning, however, which had never quite departed from the cloisters, did not join the general revelry of letters in celebrating the ideas and deeds of chivalry, but kept its pristine dignity, and amid songs, and ballads, and romances, gravely discussed exegesis and history. Thus literature was divided into theology and belles-lettres. The latter term, after the attainment of sounder views of the uses of learning, received a less comprehensive meaning, and was applied indefinitely to those departments of literature which minister to the taste and the fancy in distinction from those which are more palpably useful. It was used as descriptive of the attainments of a person who pursued learning, not thoroughly and with a scientific spirit, but with ideas resembling those which were prevalent at the period of the renaissance. In this sense it has retained a precarious existence in the English language, in which it was borrowed from the French, but the fact that the term now conveys no definite meaning has rendered its use nearly obsolete. The topics which it once embraced fall now under the heads of poetry and literature.

BELLEVAL, PIERRE RICHER DE, a French botanist, born at Châlons-sur-Marne, in 1558, died at Montpellier, in 1638. Henry IV., learning that the medical students of France were accustomed to complete their education in the universities of Italy, where the professors had botanical gardens under their charge, founded by royal edict in 1593 a botanical garden at Montpellier, in which he appointed Belleval a professor. Belleval published many botanical treatises, and is regarded as one of the founders of the science of botany, since he was among the first to consider plants according to their general characteristics without regard to their medicinal properties. He had 400 plates engraved, which were praised by Tournefort and Linnæus, but have been nearly all lost.

BELLEY, a town of France, in the depart-

ment of Ain; pop. 4,879; 88 miles S. W. from Geneva, agreeably situated in a fertile valley near the Rhone, which is here crossed by a suspension-bridge. It is the ancient *Bellica*, was a place of note in the time of Julius Cæsar, and is now the seat of a bishopric which was founded in 412. It was burned by Alaric in 390, was possessed by the dukes of Savoy during the middle ages, and was ceded to France in 1621. Its episcopal palace, the belfry of the cathedral, and its cabinet of medals and antiquities, are now its most remarkable objects. Lithographic stones, esteemed the best in France, are obtained from neighboring quarries.

BELLINGHAM, RICHARD, royal governor of Massachusetts, born in 1592, came to the colony in 1634, and died Dec. 7, 1672. In 1635 he was made deputy-governor, and in 1641 was elected governor in opposition to Winthrop by a majority of 6 votes. The election, however, appears to have displeased the general court. He was reelected in 1654, and after the death of Endicott was chosen again in May, 1666, and continued in the executive chair of the colony as long as he lived, having been deputy-governor 13 and governor 10 years. He was chosen major-general in 1664, in which year the king sent Nichols, Cortright, Coon, and Moresick as commissioners, to inquire into the state of the colony, when, according to Hutchinson, Bellingham, and others obnoxious to James II., were required to go to England to account for their conduct. The general court, however, refused obedience, and maintained the authority of the charter. His wife having died, in 1641 he married a second time, of which a contemporary speaks thus: "A young gentleman was about to be contracted to a friend of his, when on a sudden the governor treated with her, and obtained her for himself." The banns were not properly published, and he performed the marriage ceremony himself. He was prosecuted for a violation of the law, but at the trial he refused to leave the bench, but sat and tried himself, and thus escaped all punishment. In his last will he provided that after the decease of his wife and of his son by a former wife, and his granddaughter, the bulk of his estate should be spent for the yearly maintenance "of goodly ministers and preachers" of the true church, which he considered to be that of the Congregationalists. This will the general court set aside on the ground that it interfered with the rights of his family. A sister of his, Anne Hibbens, was executed at Salem in June, 1656, during the witchcraft persecution.

BELLINI. I. JACOPO, one of the early painters of the Venetian school, born in Venice about 1405, died in 1470. He was a pupil of Gentile da Fabriano, and is said to have been taught oil painting, which was then a secret, by Andrea dal Castagno, and in turn, taught it to his sons, Gentile and Giovanni. The first works by which he acquired fame were portraits of Catharine Cornaro, the beautiful queen

of Cyprus, and one of her brothers; a picture representing the passion of Christ, in which many figures were introduced, himself among the number; and a historical picture representing a Venetian legend of the miracle of the cross. This cross, containing a piece of the true one, on which the Saviour died, was by some accident thrown into the grand canal at Venice, and although many persons plunged in after it, it was the will of God that only the guardian of the brotherhood to whom the cross belonged, Andrea Vindramino, could take it out again. This event was represented in the painting. Almost all of Jacopo's works have perished; one supposed to be authentic is in the Manfrini palace at Venice, and represents the portraits of Petrarch and Laura. II. GENTILE, the elder son of the preceding, born in 1431, died in 1501. He became much more distinguished than his father, but did not rival his younger brother, Giovanni. The most affectionate intercourse existed between the brothers, who mutually aided each other. Gentile was employed by the Venetian government on an equal footing with his brother, in decorating the hall of the grand council in the doge's palace, and was also celebrated for his portraits, although his manner was rather hard. His fame attracted the notice of Mohammed II., conqueror of Constantinople, and Bellini visited the grand seignor, being sent by the senate. He painted a number of pictures for Mohammed, and also struck a medal for him, with all of which he was greatly pleased, and rewarded the painter by presenting him with a gold chain and 8,000 ducats. A story is told of his exhibiting to Mohammed a picture he had painted of the head of John the Baptist in a charger, and the emperor, who had certainly great experience in decapitation, observing that the muscles of the neck were not correctly drawn, sent for a slave and had his head cut off in the presence of the artist, to convince him of his mistake. Voltaire ridicules this tale, and Gibbon altogether rejects it. There is a very fine pen and ink drawing by Bellini in the British museum, representing Mohammed and the sultana mother, in whole length figures in a sitting position. After Gentile's return to Venice, he continued to paint, honored by the patronage of the state and of private individuals, until his death. III. GIOVANNI, second son of Jacopo, and generally regarded as the founder of the Venetian school, born in 1426, died in 1516. Some of his earliest works were portraits, among them that of the doge Loredano. Having attracted the notice of the government, he was employed by the republic to decorate the great hall of the council with a series of magnificent paintings, covering the entire walls, and designed to represent the proudest historic glories of Venice. These were worthily accomplished, but were destroyed by a great fire, in 1577. Beside these noble works of art, which occupied many years of Giovanni's life, he painted a picture of the Virgin Mary, sur-

rounded by saints, for the church of San Zaccaria, in Venice, which is still in its place and in good preservation, having been carried off to Paris, by Napoleon Bonaparte, and returned in 1815. There is another of the same subject at Castle Howard, the seat of the earl of Carlisle, and this Dr. Waagen declares to be the original work, in his "Art Treasures of Great Britain." Many more of his paintings are preserved in Venice, and other cities, several of which are in the galleries of Berlin. One of his last works was a Bacchanal; this he left incomplete, and it was finished by Titian. He has the honor of having taught 2 of the greatest of the Venetian painters, Titian, already named, and Giorgione. His coloring was of the same rich and voluptuous character; they only excelled him in grace and freedom of drawing. Giovanni Bellini died of old age, at the age of 90, and was buried in the same tomb with his brother Gentile, in the church of San Giovanni e Paolo. IV. LAURENTIO, an Italian anatomist, born at Florence, Sept. 3, 1643, died Jan. 8, 1704. He was patronized by the grand duke Ferdinand II., by whose aid he repaired to the university of Pisa, where he studied under the most distinguished masters of the time, being instructed in mechanics by Borelli, whose teachings he subsequently made great use of, in explaining, by mechanics, the phenomena of the living body. His acquirements were such that at 22 he gained the chair of philosophy and theoretical medicine. He held the chair of anatomy for over 30 years, and was regarded as a very brilliant professor, his lectures frequently securing the attendance of the grand duke. When 50 years of age, he abandoned his professorship, and returned to Florence. He made several valuable discoveries in anatomy, and wrote many works on medical subjects, as well as poems and discourses. V. VINCENZO, one of the most popular composers of modern times, born at Catania, in Sicily, Nov. 1 or 3, 1806, died Sept. 23, 1885. Before he was 20 years of age, he produced an opera at San Carlo, entitled *Bianca e Fernando*. In the following year, he wrote for La Scala, at Milan, *Il Pirata*, which had immediate success, and *La Straniera*. He produced *La Sonnambula* at Naples, and this opera still maintains its great popularity. He successively wrote *I Capuletti ed i Montecchi*, which was first performed in Venice; *Norma*, which appeared at Milan, and *I Puritani*, for the Theatre Italien, in Paris. Nearly all his works are still frequently performed, and are of a character to charm a wide variety of the lovers of music. There is an exquisite sweetness and pathos in his compositions, which win upon the great mass of listeners.

BELLMAN, KARL MICKEL, a Swedish poet, called the Anacreon of Sweden, born at Stockholm, Feb. 4, 1740, died Feb. 11, 1795. He published religious poems, and a translation of the fables of Gellert, but acquired renown only by the songs which he was accustomed to im-

provise at banquet-tables. Associated with the most brilliant and dissipated young men of the capital, he would pass the entire night singing improvisations to his friends, accompanying himself with the guitar, till he would fall down fainting. The best of his verses are thought never to have been written, but to have passed away with the joyous moment which gave them birth. The songs and idyls, which he published under the title of "Letters to Fredman," are peculiarly naïve, tender, and charming. His longest poem, the "Temple of Bacchus," is of an elegiac character, and marked by depth and brilliancy of thought. In 1839, a monument was erected at Stockholm, in honor of his genius, and a society named after him, the "Bellman," celebrates there an annual festival in his memory.

BELLOC, ANNE LOUISE SWANTON, a Frenchwoman of letters, born at La Rochelle, Oct. 1, 1799, the daughter of an Irish officer in the French service, named O'Keefe. She has earned an honorable livelihood by translating English and American works into French, and by writing educational works for the young, in which she is assisted by Mlle. Montgolfier, the daughter of the celebrated aeronaut. She has introduced to French readers the moral tales of Miss Edgeworth, several of Thomas Moore's poems, the travels of the two Landers in search of the course of the Niger, Goldsmith's "Vicar of Wakefield," Miss Sedgwick's writings, and an essay of Dr. Channing, to which she prefixed an original life of the author. Her last work of which we have information, is a translation of Mrs. Stowe's "Uncle Tom's Cabin."

BELLONA, the Roman goddess of war. She is sometimes styled the colleague, sometimes the sister, sometimes the wife, of Mars. She was worshipped as the deity whose peculiar province it was to inspire mortals with invincible valor and enthusiasm. Her temple stood in the Campus Martius, near the circus of Flaminus, and was of great political importance in the days of the republic. The priests of Bellona were called Bellonari, and as often as they sacrificed to their goddess they were obliged to lacerate their arms or legs, that they might be able to offer upon her altar a portion of their own blood. The humanity of later times, however, did away, in a great measure, with this practice. The 24th day of March in every year was the principal day of her worship, and that day was distinguished in the Roman Fasti by the title of *dies sanguinis*.

BELLOT, JOSEPH RENÉ, a French naval officer, born in Paris, March, 1826, lost off Cape Bowden, Aug. 18, 1853. He was a midshipman in the siege of Vera Cruz in 1838, and a lieutenant in 1851, when he obtained permission to serve as a volunteer in the English expedition sent out in search of Sir John Franklin, and commanded by Captain Belcher, R. N. The bravery and good conduct of the young man were remarkable, and a strait which he discovered has been named after him. On his return

home he again sought and obtained leave to join the Inglefield expedition. On one occasion, when Inglefield was absent, he offered to carry some despatches to Sir Edward Belcher, by a journey over the ice. Being overtaken by a storm, the ice on which he was, with 2 of his companions, was severed from the land. He went to the other side of the hummock to reconnoitre, and was never seen again. A monument to his memory has been erected at Greenwich hospital. His own diary, which was published in 1855, furnishes the best narrative of his adventures and enterprises.

**BELLOWS**, an instrument contrived for propelling air through a pipe. It is employed for blowing fires, supplying air to ventilate mines, filling the pipes of an organ with wind, and for other purposes. The use of this apparatus may be traced back to a very early period. It is spoken of by Jeremiah, vi. 29, and by Ezekiel, xxii. 20. When Homer describes the forging of the iron shield of Achilles, he speaks of the furnace into which the materials were thrown being blown by 20 pairs of bellows (*φύσαι*). From the remarks of Plautus in his *Fragmenta*, and of Virgil in the *Georgics*, it would appear that bellows of the ancients were made wholly of leather. The first account we have of wooden bellows is by Henry, bishop of Bamberg, in Bavaria, in 1620, when one named Pfannenschmidt (bellows smith) commenced the manufacture of them in the Hartz forest, and by his success excited the jealousy of those of the same trade in the place. His art was disclosed only to his son, and during the present century his great-grandson had still the monopoly of the forest. These data are furnished by Professor Alexander, of Baltimore, in his report upon the manufacture of iron. He is disposed, however, on the authority of Beckmann, to give the credit of their invention to Hans Lössinger, an organist, of Nuremberg, in 1550. Among many primitive nations of Asia and Africa, this machine is still employed in its simplest form for blowing by hand the fires of rudely constructed furnaces, probably of the same form as those in use in the times of Homer and of the Jewish prophets. As ordinarily constructed, the instrument consists of two similar plates of wood connected by a strip of leather fastened around their edges, which with the plates completely encloses a chamber for air, and is so made that the plates may be made to approach and recede by folding and unfolding the leather. In the lower plate is fixed a valve opening inward, through which the air enters as the plates are separated, and which closes as they are brought together, forcing the air to seek some other outlet. This is provided in a tube of small area compared to that of the valve, so that the air is made to rush outward with great velocity. As the action of this machine is to give an intermittent blast, it has been improved by introducing a third plate, attached to the lower one as this was to the upper, thus making a double bellows. The two

lower plates have valves opening upward, and the pipe or nozzle for the exit of the air is in the upper of the two chambers. The middle plate is worked up and down by a lever arm, and weights are placed upon the top of the bellows to force out the air continuously, and others are suspended from the bottom board to keep the lower chamber distended with air. A circular form is sometimes given to the plates or boards, and the air chamber surrounded by the leather is cylindrical. When shut together, it is very compact and portable, which renders it a convenient form for portable forges. The inhabitants of Hindostan make use of such bellows for blowing their small iron furnaces. A man sits down between two of them, and with one hand upon each works them alternately up and down, producing a tolerably continuous blast, but of small capacity and force. The Chinese bellows is a simple contrivance for forcing air with any desired pressure, and is upon the same principle with the large blowing machines now in general use. It is a square wooden box or pipe, with a piston-rod working in one end, and carrying a closely fitting piston, by the movement of which the air is pushed through a smaller pipe in the other end. On the reverse motion the air enters through valves and refills the box.—The useful effect of the bellows is in exciting combustion, by furnishing a continuous stream of oxygen in the fresh supplies of air, and in removing by the force of the blast those products of combustion which ordinarily exclude the approach of the air and impede the continuation of the process. Its power of rapidly exciting vivid combustion and intense heat is well seen in the action of the smith's bellows in common use. Excepting for some small operations for metallurgic purposes, and for other objects not requiring either a large volume or great pressure of air, the ancient bellows is now for the most part replaced by more efficient apparatus, as the so-called blowing machines and fan-blowers, descriptions of which will be found under **BLOWING MACHINES**.

**BELLOWS, HENRY WHITNEY, D. D.**, an American clergyman, pastor of All Souls' church in New York, born in Boston, June 11, 1814, graduated at Harvard college in 1832, entered the divinity school at Cambridge in 1834, where he completed his course in 1837. He was ordained pastor of the first Congregational church in New York, Jan. 2, 1838. He was the principal originator of the "Christian Inquirer," a Unitarian newspaper of New York, in the year 1846, and was the principal writer for its columns until the middle of 1850. His publications consist chiefly of pamphlets and discourses, perhaps 25 in number, the most conspicuous of which are his "Phi Beta Kappa Oration," 1853, and his noted defence of the drama, 1857. In 1854 he received the degree of D. D. from Harvard university. He continues pastor of the parish over which he was first ordained, although his people have twice chang-

ed their place of worship, and now occupy the edifice known as All Souls' church. He is a ready extempore speaker and a popular lecturer. His tastes and convictions lead him to intimate relations with artists, and engage him often in questions of a social and philanthropic character. He has spoken and published his views freely upon the prominent topics of the day, and inclines to deal with current interests rather than with scholastic studies. His occasional contributions to the reviews, and especially the "Christian Examiner," are marked by independence of thought and boldness of expression. The latest work which has brought him prominently before the public is his course of lectures on the "Treatment of Social Diseases," delivered before the Lowell institute in Boston, in 1857.

**BELLOWS FALLS**, a village in Rockingham township, Windham co., Vt., on the Connecticut river, so called from several rapids and cataracts occurring there. The whole descent is about 44 feet. These are the falls concerning which Peters, in his history, relates that the water becomes so hardened by pressure between the rocks, that it is impossible to penetrate it with an iron bar. It was formerly a famous place for spearing salmon from the rocks, as they attempted to force a passage. A canal with locks has been cut around the falls, through the solid rock. The river is here crossed by a bridge, 212 feet long, built in 1812. The scenery is romantic, and various interesting minerals are found in the vicinity. The village contains several mills and manufactories, and is remarkable for its handsome dwellings.

**BELLOU, PIERRE DE**, a French jurist and politician, was born at Montauban, in Brittany, about 1540; the date of his death is unknown. He espoused the cause of Henry IV., against the league; and having given great offence to the Guises by a work which he published in 1584, asserting the king's independence of the pope, he was arrested and thrown into the Bastille, where he was imprisoned 2 years, when Henry IV. appointed him advocate-general to the parliament of Toulouse.

**BELLUNO** (anc. *Bellunum*, or *Belunum*), a walled city in the north of Italy, on the river Piave; pop. 10,700. It contains a cathedral planned by Palladio, several churches, a hospital, schools, and a public library, and is supplied with water through a fine aqueduct. Large fairs are held here in February and April, and the inhabitants are extensively engaged in the manufacture of silk, leather, earthenware, and hats, and in the timber trade with Venice. The title of duke of Belluno was conferred by Napoleon on Marshal Victor.

**BELMAS**, Louis, bishop of Cambrai, France, born Aug. 11, 1757, at Montréal, in Aude, died July 21, 1841, at Cambrai. By rendering allegiance to the civil power he drew upon himself the condemnation of Rome, and even after retracting, on occasion of the coronation of Na-

poleon, his oath to the constitution, he failed to regain the confidence of the Vatican. On this account Cambrai did not become an archbishopric during his life. In 1841 he created a sensation among the journalists of Paris, by his charge to the clergy on the question of the obligations due to political authorities. He was the last bishop of France, previous to the now existing concordat.

**BELMONT**, an eastern county of Ohio, separated from Virginia by the Ohio river, and covering an area of 520 square miles. Indian, Wheeling, Captina, and McMahon creeks are the principal streams. The surface is uneven, frequently rising into hills, and the soil is excellent. Coal is found in large quantities. Cattle and horses are raised in great number. In 1850 the agricultural products amounted to 854,771 bushels of corn, 859,839 of wheat, 860,040 of oats, 16,897 tons of hay, 1,652,598 lbs. of tobacco, and 612,238 of butter. There were 74 churches, 8 newspaper offices, and 4,008 pupils in the public schools. Pop. 34,600. Capital, St. Clairsville.

**BELMONTE**, or **BELMONT**, a village in La Fayette county, Wisconsin, and formerly the seat of the territorial government. In the vicinity of this place 3 mounds, about 100 feet in height, rise up from the prairie; one of them is called the Belmont mound.

**BELMONTE**, or **Rio Jequitinhonha**, a river in the province of Bahia, Brazil. It is formed by the confluence of the Araguahi and Jequitinhonha, flows N. E., and empties into the Atlantic.

**BELMONTET**, Louis, a French literary man, born at Montauban in 1799. In 1830 he edited the *Tribune* newspaper, opposed the accession of Louis Philippe, and predicted his downfall and a second revolution in a bold pamphlet addressed to Chateaubriand, for which he was arrested. In 1839 he established, together with Messrs. Laffitte and Maignan, a manufactory, in which the men were to share the benefits with the employers. In Feb. 1851, he was accused of having planned a Bonapartist movement against the legislative assembly, but the charge was abandoned. He occupied the position of superintendent of the Tontine from 1842 to 1852, when he became a member of the legislative assembly. He is the author of many fiery republican odes, and a volume of philosophical poems entitled *Les nombres d'or* (1846) was characterized by Béranger and Lamennais as a *bréviaire des belles âmes*. In his youth he became a member of the carbonari association. When Napoleon's remains arrived at Paris, he received from the prince de Joinville a piece of the coffin, in acknowledgment of the verses addressed to him on that occasion. In 1836 Louis Napoleon stood godfather to his first-born son, and among his latest productions is a *cantate Napoléonienne*.

**BELOE**, WILLIAM, an English clergyman and author, born at Norwich, in 1756, died April 11, 1817. His friends discovering in him evi-

dences of superior talent, he was sent to Dr. Samuel Parr, then principal of an academy in Middlesex, and graduated at Cambridge in 1779. He then assisted Dr. Parr in a school at Norwich. Soon after he obtained the curacy of Earlham, and afterward became vicar. Finding the income derived from his employment insufficient, he removed to London, and for several years occupied himself by writing for the periodicals of the day. During the American revolution he used his pen freely in the cause of the colonies; but in the French revolution he advocated other views. In company with Archdeacon Nares, he commenced the publication of the "British Critic," in which he acknowledged the fallacy of his previous opinions. In 1804 he accepted the assistant librarianship of the British museum, which he held but a short time, being deprived of it on account of a loss sustained by the institution through his mistaken kindness to an unworthy applicant. He published several translations from the Greek and Latin, beside a great variety of miscellaneous productions. His translation of Herodotus (4 vols. 8vo, 1791) retains its reputation to the present day.

BELOIT, a township and village of Rock county, Wisconsin. The village of Beloit, situated on the left bank of Rock river, and very near the southern boundary of the state, was settled about the year 1837, and incorporated in 1845. It is built on a beautiful plain, from which the ground rises abruptly to a height of 50 or 60 feet, affording excellent sites for residences. It is the seat of Beloit college, founded in 1846, and is noted for its broad, handsome streets, and for its fine churches; the Congregational church, constructed of gray limestone, is said to be one of the most beautiful in the state. The village is well supplied with water power, has a flourishing trade, and, in 1855, contained several manufactories of woollen goods, of reapers and fanning mills, of scales, of carriages, an iron foundry and machine shop, 3 flouring mills, beside 1 or 2 newspaper offices, several seminaries, 8 hotels, a bank, and more than 40 stores. It is the point of intersection of 2 railroads, the Racine and Mississippi, and the Beloit and Madison, the former of which extends from Lake Michigan to Rockton in Illinois, and the latter from Madison, the capital of Wisconsin, to the Galena and Chicago railroad, 18 miles beyond Beloit. A fertile prairie, the largest in the state, lies on the eastern side of Rock river. Pop. in 1855, 4,247.

BELOOCHISTAN, or BELUDHISTAN (anc. *Gedrosia* and *Drangiana*), a country of Asia, between lat. 24° 50' and 30° 20' N., long. 57° 40' and 69° 18' E.; bounded N. by Afghanistan, E. by Sinde, S. by the Indian ocean, and W. by the Persian desert; area about 160,000 sq. m.; capital Kelat; pop. 2,700,000. The general aspect of the country is mountainous; but toward the shore of the Arabian sea on the south, and toward Persia on the west, there are extensive

districts of barren plain. The Hala mountains on the E. and N. E., running from the mouths of the Indus to the Solymán mountains, include a quantity of comparatively fertile land, of valley and upland plain, in which the inhabitants raise the grains and fruits of a tropical climate; but the remainder of the country is a wilderness, unfit for habitation. A strip of land to the east of the Hala chain, which, although within the Indus valley, belongs to Beloochistan, is very fertile, growing cereals and rich crops of jowarree (a grain much in demand in northern India), and various tropical productions. But the land here is low and swampy, to which indeed it owes its fertility, and though more numerous inhabited than the other regions, is the most unhealthy of the whole. On the N. E. boundary are situated the famous mountain passes, the Bolan and the Molan or Gundwana pass. These are the direct road to Kelat and the only means of communicating with the interior of the country from the plains of N. W. India. The eastern provinces or districts are Sarawan, Kelat, Cutch-Gundava, and Jhalawan. On the south along the seashore is the district of Loos, and on the west Mekran, the ancient Gedrosia. The inhabitants of Beloochistan consist of 2 great varieties, the Belooches and the Brahooes, which are subdivided into other tribes, and these again into families. Their origin is uncertain, but they are probably a race of mixed Tartar and Persian descent. They themselves claim to belong to the earliest Mohammedan conquerors of central Asia, and are zealous Soonnees, tolerating an unbeliever, rather than a Sheeah. Polygamy is allowed. In their nomadic habits they closely resemble Tartars or Bedouins, living in tents of felt or canvas, and wearing a woollen cloth on their heads, with woollen or linen outer coats. Their women enjoy a share of freedom. They are of spare but active forms, practise arms and warlike exercises for amusement. The Brahooes speak a dialect more resembling those of the Punjab, and are shorter and stouter built than the Belooches. They have a somewhat better character in the matter of rapine and plunder than the others. They are said to be hospitable and observant of pledges and promises. The government is under various heads, of which the khan of Kelat is leader in time of war, and a kind of feudal chief in peace. Formerly Beloochistan was subject to Persia and afterward to Afghanistan, but in the latter part of the last century the tribes shook off their dependence on the Afghans. At the time of the British expedition into Afghanistan the British forced the Bolan pass. The Belooches harassed the troops considerably; and in 1840 an expedition was sent against Kelat to chastise them, which was done effectually, but no permanent occupation was made.

BELP, a Swiss village, canton of Bern. On the south side of the village is the Belpberg, a mountain 2,940 feet high, remarkable for its numerous petrifications.

**BELSHAM, THOMAS**, an English Unitarian divine and author, born in Bedford, April, 1750, died at Hampstead, Nov. 11, 1829. His father, who was a dissenting minister, educated him at the dissenters' academy, at Daventry, of which institution he became principal in 1781, holding the office for 8 years, and also preaching at Daventry. In 1789, abandoning the Calvinistic belief, he became minister of a Unitarian congregation, and settled in 1805 as pastor of Essex-street chapel, London, where the remaining 24 years of his life were spent. Mr. Belsham wrote a great deal in assertion and vindication of Unitarianism, including a reply to Mr. Wilberforce's "Practical View;" "Evidences of the Christian Revelation;" and a "Translation of the Epistles of Paul the Apostle, with an Exposition and Notes." Among his contributions to general literature, his "Elements of the Philosophy of the Human Mind and of Moral Philosophy" (in which, with David Hartley, he resolves all mental phenomena into the association of ideas), is best known.—**WILLIAM**, a historical writer, and brother of the above, was born in 1752, and died Nov. 17, 1827, at Hammersmith. He was a whig in politics, and well acquainted with the leaders of that party. In 1789 he commenced his literary course by publishing, in 2 vols., "Essays, Historical, Political, and Literary." To these succeeded essays on various subjects, chiefly political, and several works which appeared between 1798 and 1801, and were finally reproduced in a collective edition of 12 vols. octavo, in 1806, as a "History of Great Britain to the Conclusion of the Peace of Amiens." This large work, tinged throughout with a liberal spirit, somewhat rare at the period it appeared in, abounds in facts industriously collected, though not very felicitously reproduced in the author's own words.

**BELSHAZZAR**, the last king of the Chaldean dynasty. At his court the prophet Daniel was a favorite during the captivity. His dreams and the hand-writing on the walls of his palace, interpreted by Daniel, are familiar, as well as the tragic end of his kingdom (B. C. 538), conquered by the Medes and Persians under Cyrus.

**BELSUNCE, HENRI FRANÇOIS XAVIER DE**, a celebrated French Jesuit, born in Perigord, Dec. 4, 1671, died at Marseilles, June 4, 1755. At an early age he became a member of the order of Jesuits, was made grand vicar of Agen, and in 1709 bishop of Marseilles. During the pestilence which devastated his see in 1720-'21, Belsunce was untiring in his devotion, and displayed charity and unselfishness to a degree that drew upon him the encomiums of all Europe. He is especially referred to in Pope's "Essay on Man." In consideration of his services at this period, he was offered the bishopric of Laon, and also the archbishopric of Bordeaux, but refused both, preferring to remain with those to whom he had so long rendered himself necessary. In his later years he

became involved in disputes with the Jansenists, whom he attacked with much zeal. He founded a Jesuit college which bears his name; he published several writings against Jansenism.

**BELTEIN**, or **BELTANE**, a kind of festival, still celebrated in parts of Ireland and Scotland on the 1st of May, and supposed to be as old as the remotest period of druidical supremacy. The name signifies the fire of Bel or Baal, and the custom was probably an offshoot and remnant from the oriental worship of Baal, or the sun. To the beltein may be referred the practice of lighting fires on midsummer eve in England, in honor of the summer solstice.

**BELTIRS**, a small tribe of Tartars, dwelling in Siberia, along the banks of the Abakan. They are a barbarous and heathen race, never burying their dead, but suspending them from trees in secluded places. Their practice of polygamy, and their refusal to abandon it, is said to have been the chief obstacle to their conversion to Christianity.

**BELTS**. In machinery, belts of curried leather passing over metal or wooden pulleys are used instead of gearing, when the shafts to be connected are far apart. Belts are in general used between parallel shafts, and when it is requisite that the shafts should turn in opposite directions the belt is crossed. The diameters of the pulleys are made in the inverse ratio to the number of revolutions desired. In some machines it is necessary to modify the velocity of a shaft without stopping the motion; in such cases conical drums are substituted for pulleys, the apex of each drum being opposed to the basis of the other, so that the belt once out of the proper length to embrace both drums in their central parts answers for all the other portions of the drum. The belt in this arrangement has to be guided by a fork. When the shafts are not parallel, and their axes produced intersect each other, the only way to connect them by belts is to use a third shaft, with which both are connected. When the shafts are neither parallel nor in the same plane, they can be connected by a belt, but there is only one place on each shaft for the pulleys. These must be at the ends of a straight line perpendicular at the same time to both axes. There is only one such line. This theoretical place has to be corrected in each particular case according to the diameters of the pulleys, by taking care that the belt arrives square on each pulley, no matter how obliquely it leaves the other. As a consequence of this unavoidable correction, the motion of the shafts cannot be reversed without keying the pulleys in other places.—Belts are made of leather, India-rubber, iron wire, or gutta percha. Leather is in general use, and considered the most economical, but it must be well protected against water and even moisture. A careful attendant will make a belt last 5 years, which otherwise would last but 1 or 2. Millions are yearly wasted in this way by carelessness. India-rubber is praised by a few manufacturers and con-

demned by a larger number, but it is evidently the proper substance for belts exposed to the weather, as it does not absorb moisture, and consequently does not stretch and decay. Iron wire has been experimented upon, and promises well, but it requires a peculiar construction of pulleys, which has not as yet been perfected. Gutta percha has been used during the last 4 years at the zinc factory of *La Vieille Montagne*, in Belgium, and is spoken of very favorably. A company is now introducing the manufacture of gutta percha belts into the United States. The 2 ends of a belt may be united together by riveting, or by clamps of various construction, but the best way is to cut small holes through the ends, and to lace them together with a strap of leather.—In designing a machine, the width of the belt, the diameter of the drums or pulleys, and the velocity, have to be determined, and there is no generally admitted rule for doing this. Some engineers believe that the friction of a belt on a pulley follows the general laws of friction, and depends only upon the tension of the belt; according to their view, a belt will not slide more easily on a small pulley than on a large one. Others, having remarked that a belt slides more easily on a rough cast than on a turned pulley, think that in the latter case the air is excluded, and that the belt is pressed against the pulleys by atmospheric pressure to the amount of about 8 lbs. to the square inch, and thence it follows that the adhesion is proportional to the extent of the surfaces in contact, or to the diameter of the pulley. According to the first theory, the tighter a belt the greater the friction; according to the second, tightness has little effect beyond a certain point. It has been found in practice that belts must not be run faster than 80 feet per second, nor have a tension of above 800 lbs. per square inch of section. The friction of a belt on a pulley is proportional to the arc in contact with the belt. This friction depends also on the material of the pulley, and is nearly as much again on wood as on cast-iron. When a machine has to be driven very fast, as is the case with wood-turners' lathes, the friction on the bearings has to be reduced as much as possible to prevent heating, by leaving the belt loose on the pulleys. The proper friction is then obtained by sprinkling chalk or powdered rosin on the belt, but this treatment injures it, and is only resorted to for small belts, the price of which is insignificant when compared with the value of the work performed. The friction of a belt or of a rope on a standing cylinder is accurately known, and is found in the following manner: a belt is passed over a horizontal cylinder, a known weight is suspended at one end, and the other is attached to a spring-balance, and gradually let go till the belt or rope begins to slide; the suspended weight *minus* the one indicated is the friction. It has thus been found that by taking a turn and a half around a rough cylindrical post, 1 lb. will hold 110 lbs. in check, and

that by taking 2½ turns 1 lb. will hold 2,500 lbs. As data to start from in designing a belt, the following is a good example: a 12 inch belt, over a pulley of 4 feet in diameter, running 80 feet a second, will transmit the power from a 6 inch cylinder, 1 foot stroke, 60 lbs. pressure, making 125 revolutions per minute.

BELTS, GREAT and LITTLE, the name given to 2 narrow channels which connect the Baltic with the Cattegat. The Great Belt is 37 miles long, 18 miles in medium width, and from 6 to 26 fathoms deep. It lies between the islands of Seeland and Funen, the shores of which present no striking features, but are lined with safe harbors. Navigation is difficult at all seasons on account of many dangerous shoals and sand-banks, and in winter is still further obstructed by floating ice, though the swiftness of the current prevents the strait from being often frozen over. Light-houses have been erected on the shores, and on the small island of Sprogø, which lies in the middle of the channel, and which the action of the waves is gradually wearing away.—The Little Belt separates Funen from Jutland. It is 80 miles long from 1,000 yards to 12 miles wide, and from 5 to 80 fathoms deep. The shores are low and regular, and the current rapid. It is frozen over from December to April, and navigation at other seasons is attended with the same dangers as in the Great Belt. Large vessels usually pass through the sound, which is the only channel except the Belts between the Cattegat and the Baltic.

BELUS, a river about 5 miles long, which rises in the slopes of that range of hills anciently known as Carmel, and empties into the Mediterranean. It lies in the present Syrian pashalic of Acre, near the bay of the same name. It is noted as the source of the sand out of which, Pliny says, glass was first made. The story of the accidental discovery of its vitreous properties is familiar. As late as the middle of the 17th century, it furnished the supply of the principal glass manufactories of Italy. The Greek name for glass (*ύελος*) was perhaps corrupted from Belus. The present name of this river is Naman.

BELUS, the name of the national god of the Babylonians, and perhaps the same as Baal, whose worship became so general in the East, and so often incorporated into Judaism, or at least adopted and practised by the Jews. It does not appear, however, from the accounts given by Herodotus and Diodorus, that Belus was worshipped by human sacrifices, while Baal very plainly was. But if the worship of Belus was of later date than that of Baal, this difference in the rites may be accounted for. If there were two temples or towers at Babylon, as some antiquaries and critics have maintained—first, the temple of Baal, or tower of Babel, and secondly, the tower of Belus, built later on the site of the former, after the long desertion of Babylon for the rival city and empire of Nineveh, and at the return of the scep-

tre to Babylon under Nabopolassar—then the worship may have been so modified by time and culture as to account for all this apparent difference between Baal and Belus, and make the latter only the reappearance, after the lapse of ages, of the former. At any rate, in the worship of Belus, appears the same general conception which characterized that of Baal, viz., that of male and female divinities; for in the ancient representations of Belus, like Baal, he is represented as the sun, and the moon is always present, and so the worship of both Baal and Belus is the worship of the prolific power of nature.

**BELUS, TEMPLE OF.** The huge and barren mound of yellow earth and bricks known to modern travellers as Birs Nimroud, was by the early eastern explorer, Benjamin of Tudela, regarded as the identical tower of Babel, arrested in its erection by the divine interposition, as recorded in Genesis. Later explorations resulted in the opinion that the present tower was the one built by Nebuchadnezzar in the reestablishment of the Chaldean dynasty in Babylon (B. C. 625), and that it occupied the site of the tower of Babel, which had become more or less dilapidated or completely removed during the 16 or 17 centuries that had elapsed since its erection. Still more modern examinations have, however, resulted in the suggestion (by Sir Henry Rawlinson, 1854) that the present structure by Nebuchadnezzar occupies the site of a former temple or tower erected by a former king, during the period when the Chaldean power was partially humbled under the Assyrian. A cuneiform record found on the cylinders built into the corners of the present structure, attributes the previous temple to Tiglath-Pileser I., who dates back 504 years before Nebuchadnezzar. If, therefore, the present site (Birs Nimroud) be the site of the tower of Babel, it must have been twice rebuilt. The remains, so far as yet discovered, belong to the time of Nebuchadnezzar. The bricks taken from it all bear his name. The temple of Belus is described by Herodotus as a square building or platform on which rise successively eight terraces; on the top of the last a temple crowns the structure. These terraces, he says, were ascended on the outside. The ruin of Birs Nimroud is described by modern travellers as a huge and irregular mound of barren yellow sand, underneath which explorations have laid bare a mass of brickwork showing the evidences of a subjection to the agency of fire after the erection, and still preserving in many parts a terraced structure, but not so complete as to afford any determination of the number of the terraces. Layard, in his "Discoveries among the Ruins of Nineveh and Babylon," gives the height of the entire mound as 235 feet, and proposes a restoration of the original form, in a conjectural number of terraces, on the eastern side, but perpendicularly rising on the west in a solid wall. This mound stands about 6 miles S. W. of Hillah, and be-

tween Hillah and Birs Nimroud are frequent remains of ancient buildings or fortifications, giving rise to the conjecture that this may be the lost western half of the ancient city of Babylon, through which the Euphrates made a nearly diagonal course from north to south.

**BELVEDERE.** In Italian architecture, the name Belvedere is applied to a pavilion on the top of a building; also to an artificial eminence in a garden. With the continental Europeans, this name is a great favorite for the designation of villas, palaces, villages, and streets. There is the palace Belvedere, in Rome, for instance, which contains, among other wonderful works of art and antiquity, the world-renowned statue, known as the Apollo Belvedere; also the imperial villa of Belvedere, in Vienna, formerly the property of Eugene of Savoy, with a gallery of paintings, and the Ambrosian collection of ancient weapons; also the chateau of Belvedere, near Weimar, immortalized by Goethe, who loved to roam in the park and the surrounding promenades. In Saxon Switzerland, near the village of Hirnschutchen, there is a fine castle of Belvedere; there is one also near Neu-Strelitz in Mecklenburg. The French for Belvedere is Bellevue; this is also a popular name for villas and castles. The most celebrated was that built for Madame de Pompadour, in 1748, on a mountain ridge, between St. Cloud and Meudon, and decorated by the most eminent artists of her day. Louis XV. was so enchanted with the chateau, that he purchased it. After his death, the aunts of Louis XVI. lived there.

**BELVOIR,** an extra-parochial district of England. On an isolated eminence, overlooking a beautiful and fertile vale, stands Belvoir castle, the seat of the duke of Rutland. This mansion was erected by William de Todenet, standard-bearer of William the Conqueror, and despite many modern additions, still preserves the appearance of an old baronial residence. In the time of Henry VIII., it passed, with its numerous dependencies, into the hands of the Manners family.

**BELZONI, GIOVANNI BATTISTA,** a traveller and explorer in Egypt, the son of an Italian barber, born at Padua about 1778, died Dec. 8, 1823. He was educated for a monastic life at Rome. This plan was interrupted by the French revolution, and after wandering for some time about the continent, he went to England in 1808. Here he at first gained a precarious subsistence by exhibiting as an athlete, at Astley's circus, being endowed with prodigious strength. To these feats were added scientific experiments, as he had paid much attention to natural philosophy, particularly to the branch of hydraulics. He married in England, and after residing there for 9 years, conceived a strong desire to travel in the south of Europe. Accordingly, he set out with his wife, and visited Portugal, Spain, and Malta. While in that island, it is supposed that he thought of turning his knowledge of hydraulics to good account, by offering his services to the pasha of Egypt in constructing wa-

ter wheels to irrigate the fields contiguous to the river Nile. He arrived in Egypt June 9, 1815, and constructed for the pasha one of his hydraulic machines, at the gardens of Soobra, 3 miles from Cairo. Mehemet Ali himself appears to have been satisfied with its powers, but the Turkish and Arab cultivators regarded it as an innovation, and as their narrow prejudices were not to be overcome, Belzoni abandoned his scheme without even being rewarded by the pasha for what he had undertaken. His curiosity being now strongly excited on the subject of Egyptian antiquities, at the recommendation of Burckhardt, he was employed by Mr. Salt, the English consul, to remove the colossal head, generally but incorrectly styled the young Memnon. This Belzoni successfully accomplished, transporting it to Alexandria, and thence shipping it for England. For this purpose, Belzoni went to Thebes, and then crossing to the west bank of the Nile, visited the Memnonium, where was the mighty head he was to remove. He found it, as he narrates, near the remains of its body and chair, apparently smiling upon him at the thought of being carried to England. After incredible toil and perseverance, in the face of vexatious delays, the head was brought to the edge of the Nile, Aug. 12, 1816, placed on board of a boat, Nov. 17, and safely landed at Cairo, Dec. 15 following. In the mean time, he made excursions with his wife, who was as much interested in Egyptian antiquities as himself, and who rendered essential service, to the mountain of Gornoo, celebrated for its vast sepulchral excavations, and the number of mummies contained in them. He proceeded also to Asswan, and the beautiful island of Philæ, renowned for its majestic ruins, and on arriving at Ipsamboul, he saw with amazement the mighty rock-cut temple which had been discovered by Burckhardt. This temple he was the first to open, its entrance having been completely choked with sand. In 1817 he made a second journey to upper Egypt, and became involved, greatly against his will, in some very unpleasant squabbles with Drovetti, the French consul, and his coadjutor the count de Forbin. He visited the necropolis of Thebes, and made excavations at Karnac. Among the catacombs at the mountain of Gornoo, which was the burial-place of Thebes, he made diligent search for papyri, which are sometimes found wrapped in the swathings of the mummy, about the breast, arms, or legs. It is impossible, as Belzoni observes, to form an adequate idea by any description of these awful repositories of the Egyptian dead. The necropolis is a tract of about two miles in length, at the foot of the Libyan range, and every part of these rocks is scooped out into a sepulchre. "In some places there is not more than the vacancy of a foot left, which you must contrive to pass through in a creeping posture, like a snail, on pointed and keen stones, that cut like glass. After getting through these passages, some of them 200 or 300 yards long,

you generally find a more commodious place, perhaps high enough to sit. But what a place of rest! surrounded by bodies, by heaps of mummies in all directions, which, previous to my being accustomed to the sight, impressed me with horror. The blackness of the wall; the faint light given by the candles or torches, for want of air; the different objects that surrounded me, seeming to converse with each other; and the Arabs, with the candles or torches in their hands, naked and covered with dust, themselves resembling living mummies—absolutely formed a scene that cannot be described. After the exertion of entering into such a place, through a passage of 50, 100, 300, or perhaps 600 yards, nearly overcome, I sought a resting place, found one, and contrived to sit; but when my weight bore on the body of an Egyptian, it crushed it like a handbox. Once I was conducted from such a place to another resembling it, through a passage of about 20 feet in length, and no wider than the body could be forced through. It was choked with mummies, and I could not pass without putting my face in contact with that of some decayed Egyptian; but as the passage inclined downward, my own weight helped me on. I could not help being covered with bones, legs, arms, and heads, rolling from above. Thus I proceeded from one cave to another, all full of mummies, piled in various ways, some standing, some lying, and some on their heads." Belzoni also discovered another colossal head of granite, which is now in the British museum, and, in the valley of Behan-el-Molouk, the most perfect of known Egyptian tombs. It contained several chambers, sculptured and painted in the most magnificent manner, and a sarcophagus of the finest oriental alabaster, 9 feet 5 inches long, and 8 feet 7 inches wide. Having taken drawings of the tomb and its paintings, Belzoni exhibited a model of it in London, in 1821, which attracted crowds of visitors. Before leaving Egypt, he succeeded, in 1818, after much trouble, in discovering the entrance to the second of the great pyramids of Ghizeh, that of Oepheene. This, ever since the time of Herodotus, was believed to be without internal chambers. After 80 days of persevering labor, Belzoni found the entrance, and penetrated to the central chamber. He also visited the district of Fayoom, and the so-called oasis of Jupiter Ammon, Lake Moeris, and discovered the ruins of Berenice. He left Egypt in Sept. 1819, and visited his native city of Padua, where a medal was struck in his honor; and on his return to England, he published an interesting narrative of his travels and operations amid the monuments of the Nile. In 1823 he formed the design of penetrating to Timbuctoo, in Africa, and had reached the Bight of Benin, but was attacked with dysentery, which carried him off, at a small place in Benin.

BEM, JOZER, a Polish general, born at Tarnow, in Galicia, in 1795, died Dec. 10, 1850. The passion of his life was hatred of Russia.

At the epoch when Napoleon, by victories and proclamations, was exciting a belief in the resurrection of Poland, Bem entered the corps of cadets at Warsaw, and received his military training at the artillery-school directed by Gen. Palletier. On leaving this school, he was appointed lieutenant of the horse-artillery; served in that capacity under Davoust and Macdonald in the campaign of 1812; won the cross of the legion of honor by his coöperation in the defence of Dantzic; and, after the surrender of that fortress, returned to Poland. As the czar Alexander, affecting a great predilection for the Polish nation, now reorganized the Polish army, Bem entered the latter in 1815, as an officer of artillery, but was soon dismissed for fighting a duel with his superior. However, he was subsequently appointed military teacher at the artillery-school of Warsaw and promoted to the rank of captain. He now introduced the use of the Congreve rocket into the Polish army, recording the experiments made on this occasion in a volume originally published in French and then translated into German. He was querulous and insubordinate, and, from 1820 to 1825, was several times arraigned before courts-martial, punished with imprisonment, released, imprisoned again, and at last sent to Kock, a remote Polish village, there to vegetate under strict police surveillance. He did not obtain his discharge from the Polish army until the death of Alexander, and the Petersburg insurrection made Constantine lose sight of him. Leaving Russian Poland, Bem now retired to Lemberg, where he became an overseer in a large distillery, and elaborated a book on steam applied to the distillation of alcohol. When the Warsaw insurrection of 1830 broke out he joined it, after a few months was made a major of artillery, and fought, in June, 1831, at the battle of Ostrolenk, where he was noticed for the skill and perseverance with which he fought against the superior Russian batteries. When the Polish army had been finally repulsed in its attacks against the Russians who had passed the Narev, he covered the retreat by a bold advance with the whole of his guns. He was now created colonel, soon after general, and called to the command-in-chief of the Polish artillery. At the storming of Warsaw by the Russians he fought bravely, but, as a commander, committed the fault of not using his 40 guns, and allowing the Russians to take Vola, the principal point of defence. After the fall of Warsaw he emigrated to Prussia with the rest of the army, urged the men not to lay down their arms before the Prussians, and thus provoked a bloody and unnecessary struggle, called at that time the battle of Fischau. He then abandoned the army and organized in Germany committees for the support of Polish emigrants, after which he went to Paris. His extraordinary character, in which a laborious fondness for the exact sciences was blended with restless impulses for action, caused him to readily embark in adventurous enterprises, whose failure gave an advan-

tage to his enemies. Thus having in 1833, on his own responsibility, undertaken without success to raise a Polish legion for Don Pedro, he was denounced as a traitor, and was fired at by one of his disappointed countrymen, in Bourges, where he came to engage the Poles for his legion. Travels through Portugal, Spain, Holland, Belgium, and France, absorbed his time during the period from 1834 to 1848. In 1848, on the first appearance of revolutionary symptoms in Austrian Poland, he hastened to Lemberg and thence, Oct. 14, to Vienna, where all that was done to strengthen the works of defence and organize the revolutionary forces, was due to his personal exertions. The disorderly flight in which, Oct. 25, a sally of the Viennese mobile guard, headed by himself, had resulted, wrung from him stern expressions of reproof, replied to by noisy accusations of treason, which, in spite of their absurdity, gained such influence that, but for fear of an insurrection on the part of the Polish legion, he would have been dragged before a court-martial. After his remarkable defence, Oct. 28, of the great barricade erected in the Jägerzeile, and after the opening of negotiations between the Vienna magistrates and Prince Windischgrätz, he disappeared. Suspicion, heightened by his mysterious escape, dogged him from Vienna to Pesth, where, on account of his prudent advice to the Hungarian government, not to allow the establishment of a special Polish legion, a Pole named Kolodjecki fired a pistol on the pretended traitor and severely wounded him. The war in Transylvania, with the command of which the Hungarian government intrusted Bem, leaving it, however, to his own ingenuity to find the armies with which to carry it on, forms the most important portion of his military life, and throws a great light upon the peculiar character of his generalship. Opening the first campaign toward the end of Dec. 1848, with a force of about 8,000 men, badly armed, hastily collected, and consisting of most heterogeneous elements—raw Magyar levies, Honveds, Viennese refugees, and a small knot of Poles, a motley crew reinforced in his progress through Transylvania by successive drafts from Szeklers, Saxons, Slaves and Roumanians—Bem had about 2 months later ended his campaign, vanquished Puchner with an Austrian army of 20,000 men, Engelhardt with the auxiliary force of 6,000 Russians, and Urban with his freebooters. Compelling the latter to take refuge in the Bukovina, and the two former to withdraw to Wallachia, he kept the whole of Transylvania save the small fortress of Karlsburg. Bold surprises, audacious manœuvres, forced marches, and the great confidence he knew how to inspire in his troops by his own example, by the skilful selection of covered localities, and by always affording artillery support at the decisive moment, proved him to be a first-rate general for the partisan and small mountain warfare of this first campaign. He also showed himself a master in the art of suddenly creating and disciplining an army; but being content

with the first rough sketch of organisation, and neglecting to form a nucleus of choice troops, which was a matter of prime necessity, his extemporized army was sure to vanish like a dream on the first serious disasters. During his hold of Transylvania he did himself honor by preventing the useless and impolitic cruelties contemplated by the Magyar commissioners. The policy of conciliation between the antagonist nationalities aided him in swelling his force, in a few months, to 40,000 or 50,000 men, well provided with cavalry and artillery. If, notwithstanding, some admirable manoeuvres, the expedition to the Banat, which he engaged in with this numerically strong army, produced no lasting effect, the circumstance of his hands being tied by the coöperation of the incapable Hungarian general, must be taken into account. The irruption into Transylvania of large Russian forces, and the defeats consequently sustained by the Magyars, called Bem back to the theatre of his first campaign. After a vain attempt to create a diversion in the rear of the enemy, by the invasion of Moldavia, he returned to Transylvania, there to be completely routed, July 29, at Schässburg, by the 8 times stronger Russian forces under Lüders, escaping captivity himself only by a plunge into a morass from which some dispersed Magyar hussars happened to pick him up. Having collected the remainder of his forces, he stormed Hermannstadt for the second time, Aug. 5, but for want of reinforcements soon had to leave it, and after an unfortunate fight, Aug. 7, he retraced his steps to Hungary, where he arrived in time to witness the loss of the decisive battle at Temesvár. After a vain attempt to make a last stand at Lugos with what remained of the Magyar forces, he reëntered Transylvania, kept his ground there against overwhelming forces, until Aug. 19, when he was compelled to take refuge in the Turkish territory. With the purpose of opening to himself a new field of activity against Russia, Bem embraced the Mussulman faith, and was raised by the sultan to the dignity of a pasha, under the name of Amurath, with a command in the Turkish army; but, on the remonstrances of the European powers, he was relegated to Aleppo. Having there succeeded in repressing some sanguinary excesses committed during Nov. 1850, on the Christian residents by the Mussulman populace, he died about a month later, of a violent fever, for which he would allow no medical aid.

BEM, MAGNUS VON, a Russian traveller, lived in the second half of the 18th century, was governor of Kamtchatka from 1772 to 1799, was honored for his efforts to ameliorate the condition of that country, and for his philanthropic exertions to succor the companions of Capt. Cook in 1775, and asked to be recalled from his office by reason of ill health.

BEMBATOOKA, BEMBATOOK, or BOMBETOK, a bay and town on the N. W. coast of Mada-

gascar. The town is small, and of no importance, but the bay is commodious enough to receive the largest fleet.

BEMBO, BONIFAZIO, an Italian painter, born at Valdarno, was employed by the court of Milan about the middle of the 15th century. He assisted in the decoration of the cathedral of Cremona, where he painted the "Purification" and the "Adoration of the Magi." His works are esteemed for their brilliant coloring, bold attitudes, and splendid drapery.—GIOVANNI FRANCESCO, brother and pupil of the preceding, a painter of the Cremonese school, who of all his contemporaries departed farthest from the antique manner, and resembles Fra Bartolommeo in coloring, though inferior to that master in dignity and energy of expression.

BEMBO, PIETRO, an Italian cardinal and author, born at Venice, May 20, 1470, died at Rome, Jan. 18, 1547. He was of a noble family, and at an early age studied at Florence, whither his father was sent as ambassador. To his 2 years' residence in that city the Florentine authors attribute his perfect command of the Tuscan dialect. Master of an elegant Latin style, he went in 1493 to Messina, in Sicily, to study Greek under the learned exile from Constantinople, Laecaria. Returning 2 years later to his native city, he was so besieged with questions about Etna, that to satisfy all at once he wrote his treatise upon that mountain, which was his first publication. He then frequented the courts of Ferrara and Urbino, pursuing philosophical and literary studies, and admired for his wit and graceful manners. Learning and letters were then in the highest esteem in the noble families of Italy, and Bembo had many powerful patrons, received favors from Pope Julius II., and accompanied his friend, Giovanni de' Medici, on his way to Rome, to be crowned Pope Leo X. He was made secretary to the new pope, enjoyed the acquaintance of the many distinguished men in that age of the Medici, and busied himself in the labors of composition. The young and beautiful Morosina, whom he tenderly loved, persuaded him upon the death of Leo X. in 1521 to retire from public affairs, and to spend the rest of his life in literary elegance at Padua. Here he formed an extensive library and collection of medals, enjoyed the society of his learned friends, and his house was called the temple of the muses. He sometimes visited Rome, and having become a cardinal after the accession of Paul III., he determined to embrace another manner of life. He renounced profane letters, studied the fathers and theologians, was advanced to several bishoprics, and died in sentiments worthy of a prince of the church. His writings, consisting of letters, poems, dialogues, criticisms, fragments, and a history of Venice, are distinguished for their elegance and gracefulness of style. Without either imagination or force of thought, he was yet a consummate imitator of Cicero in Latin, and of Petrarch in Italian. His works were

the favorite reading among the superior ranks of Italy, and an acquaintance with them was necessary in order to mingling in polished society. It is his chief merit that he was one of the first to revive the beauties of the Italian tongue, after the invasions of classical learning had made the language of Dante vulgar.

BEN. See ABEN.

**BENALCAZAR**, **SEBASTIAN DE**, the first conqueror of Popayan, New Granada, born about the end of the 15th century, at Benalcaz, in Estremadura, Spain, died in 1550. He set out as a common sailor in the train of Pedrarias, the newly appointed governor of Darien, 1514. The ability and daring of young Sebastian gained for him the confidence of Pizarro. This conqueror sent him against the Indian leader, Ruminahui. Sebastian was favored at the moment of engagement by a happy accident; the volcano of Cochabamba suffered an eruption. The Peruvian army was more frightened at it than the Spaniards, and fled to Quito. Sebastian then possessed himself of the smoking ruins of this city. From here he passed northward and conquered the territory possessed by a chief named Popayan, whose name he preserved to designate the territory over which the former had held sway. Inflamed by the speeches of an Indian captive, who spake strange words about a chief further north, who was anointed with gold-powder, Benalcazar and his band determined to visit and conquer this *El Dorado*, or chief of gold. After traversing vast forests, in 1584, he arrived at the country which afterward received the name of New Granada. Arrived there, he found himself forestalled by two other Spanish adventurers, or *conquistadores*. He returned to Popayan, and was made governor of this province by a decree dated 1538. When La Gasca succeeded in supplanting Diego Pizarro, he deprived Sebastian of his governorship. The conqueror of Popayan died heart-broken at this result of a life spent in adventure and in the service of the Spanish crown.

**BENAOCAZ**, a town of Spain, in a mountainous district of Andalusia, 60 miles N. E. from Cadiz. It has a parish church and town-house, and a promenade and avenue, with beautiful gardens and fountains.

**BENARES**, a large and famous city of Hindostan, the capital of a division of the Bengal presidency, on the left bank of the Ganges, 890 miles N. W. of Calcutta, and 420 miles S. E. of Delhi. It is famous as having been, in ancient times, the seat of Braminical learning and speculation. It is entitled to the distinction of being regarded as the Hindoo Rome, or the ecclesiastical metropolis of Hindostan. It has been styled the Athens of India. The city is regarded as a sacred place by the Hindoos, who resort to it in great numbers from every part of Hindostan. It is always thronged with mendicant priests. Its external appearance is highly imposing. It stretches for several miles along the edge of the river, from which ascend

numerous flights of stone steps. The streets are only a few feet wide, and the buildings, which are principally stone, are very lofty. They are built to enclose a circular space, and frequently contain 200 inhabitants each. The wealthy Hindoos live in detached houses, surrounded by walls with open courts. The poorer live in mud-built dwellings, of which there are 16,000. In the centre of the city is a large mosque, with 2 minarets 232 feet high, built by Aurungzebe on the site of a magnificent Hindoo temple, which he destroyed for the purpose of erecting the present building. There are numerous other mosques, a great number of Hindoo temples, an ancient observatory, and the Hindoo Sanscrit college, the chief institution of native learning in India. The population is estimated at from 200,000 to 500,000; but at certain times the number is immensely increased. Nine-tenths of these are Hindoos, and the remainder Mohammedans. Among its inhabitants are many wealthy native bankers and dealers in diamonds, for which gem the city is famous. It is the seat of a British court of circuit and appeal, an English college, numerous Christian missions, and Mohammedan and Hindoo schools. Benares has a very extensive trade in shawls, muslins, silks, cottons, and fine woollens, of its own manufacture, and in European goods, salt, indigo, and opium.—A mutiny of native troops took place here June 4, 1857. The military authorities of the city, apprehending the spread of disaffection in the 37th regiment of native infantry, stationed at Benares, determined to disarm them. But the promulgation of an order to this effect only hastened an outbreak. The infantry immediately fired upon their officers, killing 2 or 3, and wounding others, while the greater part of a body of Sikhs and the 13th irregular cavalry, upon whom the Europeans chiefly relied, sided with the mutineers and joined in the attack. A few buildings were burnt, but a small detachment of the Madras fusileers arriving opportunely that same day, the rising was speedily put down.—The district of Benares is situated between lat. 24° and 25° N., and between the rivers Ganges and Sye (which on 3 sides separate it from Ghazipoor), having west the districts Mirzapoor and Juanpoor. It was ceded in 1775 to the East India company, by the king of Oude. In 1776, the district was granted to the rajah Cheyt Singh, of Benares, subject to the payment of an annual tribute to the company. The violation of this agreement by Mr. Hastings, governor-general of India, formed one of the charges against him in the case of his impeachment by the house of commons. The area of Benares is 994 square miles. It is well watered by the Ganges and the Goomty rivers, and by several tributaries of these streams. The land is mostly fertile and well cultivated. The native products are barley, wheat, peas, flax, and sugar. The most profitable productions are indigo and opium. During 9 months of the year the

climate is temperate, but during the 3 months from April to June, hot winds prevail, and destroy the verdure. Pop. in 1853, 851,757.

**BENBOW, JOHN**, an English admiral, born in Shrewsbury in 1650, died in Jamaica, Nov. 4, 1702. He was reared in the merchant service, and in one of his trips to the Mediterranean in 1686, he conducted an engagement so desperately against an African corsair, that he was invited to the Spanish court by Charles II., who recommended him to James II. of England. The latter gave him the command of a ship of war to protect British interests in the English channel, and subsequently he was promoted to the rank of rear-admiral, and employed in blockading and bombarding the French ports. In 1701, with a squadron under his command, he sailed to the West Indies. This command had been previously declined by several of his seniors, as an extra-hazardous expedition. But in the conduct of it, Benbow's courage and energy were so conspicuous as to elicit the commendation of the commons. In the following year, and on a second expedition to the Indies, he encountered the French fleet under Duquesne, and for 5 days maintained a running fight with them. He succeeded in bringing the enemy's sternmost ship to close quarters, but his chief officers refused to second his efforts. Here he lost a leg by a chain-shot, an event, which, though it did not abate his ardor, gave occasion for some of his captains to agree "that nothing more was to be done." On his return to Jamaica, he brought the delinquents to court-martial, which convicted them of disobedience and cowardice, and caused them to be shot. His wound, and the emotion caused by these events, concurred with a pulmonary disease to hasten his death at the age of 52. Benbow was not a very successful commander, but was distinguished for his bravery and professional enterprise. His whole life was spent in active service at sea.

**BENCOOLEN** (Malay, *Bangka Ulu*, rolling uplands), a Dutch residency on the N. W. coast of Sumatra; bounded N. by Manjuta river; E. by the mountain chain extending from Gunung Raja, to the extremity of the peninsula, forming the W. side of Samangka bay; and W. by the Indian ocean. Area, including the island of Engano, which belongs to this residency, 8,736 sq. m.; pop. in 1849, 93,875. This long narrow strip of territory, lying between a mountain-chain and the sea-board, very much resembles Chili in South America, in form. The soil is inferior to that of the eastern slope of the island; it is for the most part a stiff, red clay, burnt nearly to the state of a brick where it is exposed to the sun. The chief culture was pepper, during the first intercourse of Europeans with this country. In 1798, the clove and nutmeg were introduced from the Moluccas; but the latter alone has succeeded, and that only by manuring, and much labor and care, not required in the parent country. The

forests between Cawoor and Oroé abound in *gutta percha* and *gutta taban* trees, which produce a gum of excellent quality. Coffee is beginning to be cultivated, even by the natives on their own account, to considerable extent. The *styrax benecoin* tree, from which the gum benjamin of commerce is obtained, are grown in plantations. The buffalo and goat are the only large animals domesticated; the use of the horse as a beast of burden is not known to the natives of this territory, or even in any portion of the southern half of the island, and it is only rarely imported for the saddle, by Europeans. Tigers are very numerous in this part of the island, and materially impede the prosperity of the country; it is impossible to raise small stock, except in the well-defended enclosures of large villages. The Rejangs, one of the most civilized races of Sumatra, compose the greater portion of the population of this territory.—The chief town of the above territory, also named Bencoolen, is in lat. 3° 47' 30" S., long. 102° 48' E.; pop. 7,500. The British East India company established a factory at this point, for the pepper trade, June 25, 1685. In 1714, Fort Marlborough was founded, 3 miles distant. In 1760, the French under Count D'Estaing captured and took possession of the fort and factory; but they were restored to the company by the treaty of Paris in 1763. By the treaty of London in 1824, the English government ceded the fort and factory, and establishments dependent on them, which then embraced a territory of about 12 square miles, to the Dutch, in exchange for Malacca and its territory, and Cinsura, in Hindostan, after being in possession 140 years. Bencoolen was an unprofitable dependency of the Bengal presidency, and cost the East India company, on an average, about \$60,000 per annum, during the whole period of its possession; it was maintained partly from a point of honor, but chiefly on account of an infatuated over-estimate of the advantages expected to grow out of the pepper trade. During the English possession, the town contained 20,000 inhabitants, which have now dwindled to one-third that number, composed of Rejangs, Malays, Bughis, and a large number of Arabs and Chinese. A Dutch assistant-resident resides here.

**BENDA, FRANZ**, a German violinist, born in Bohemia, in 1709, died at Potsdam, in 1786. He exhibited, while a boy, a great desire to learn the violin, which he could gratify in no other way than by joining a band of strolling musicians. He found means, however, to acquire an extraordinary mastery of the instrument, and in 1732 entered the service of Frederick the Great, then prince-royal, with whom he remained the rest of his long life. He founded a school of violinists, whose method of playing was entirely original and quite effective. He also published some excellent solos for the violin.—GROZE, a brother of the preceding, and a composer of music, born in Bohemia, in 1722, died at Köstritz, in 1795. He pass-

ed many years of his life as musician in the service of the courts of Prussia and Gotha, and perfected his style by a visit to Italy in 1760. He composed a number of comic operas, and 2 of a serious character entitled "Ariadne in Naxos" and "Medea," which are written with much feeling and taste. His music, according to Dr. Burney, is new, profound, and worthy of a great master, and the best of it was composed after his return from Italy. Beside his operas, Benda wrote some excellent sonatas for the harpsichord.

**BENDALOU, PAUL**, a gallant soldier of the American revolutionary army, born at Montauban, in France, Aug. 15, 1755, died in Baltimore, in Maryland, Dec. 10, 1826. In Oct. 1776, he embarked at Bordeaux for the United States, as a volunteer in the cause of liberty, and, on reaching the head-quarters of Washington, he received a lieutenant's commission. Transferred to the command of Pulaski, he was captain of the first company in his famous legion at the siege of Savannah. There he carried off the field the body of the generous Pole, and preserved, also, the standard of the legion, which had been wrought and presented by the wives and daughters of Maryland. He was quartermaster-general, with the rank of colonel, in the Maryland militia during the war of 1812, and for many years U. S. marshal for the circuit and district courts of Maryland, his official conduct, from first to last, being marked with exactness and integrity.

**BENDAVID, LAZARUS**, a German philosopher and mathematician, born of Hebrew parents at Berlin, Oct. 18, 1762, died March 28, 1832. A glass-grinder by trade, he attained by his own unaided efforts such a degree of learning, that he was admitted as student in the university of Göttingen, although he never went through the usual preparatory course of studies. He graduated with much distinction at Göttingen, and on his return to Berlin devoted himself to the study of Kant. He remained throughout his life a faithful disciple of this philosopher, and prepared a course of lectures upon his theory, which he first delivered at Berlin, and subsequently at Vienna, where he resided for several years, until the persecutions to which he was subjected there induced him to return to his native city. He continued to lecture in Berlin, and displayed at the same time a laudable activity in many other literary and beneficent directions. During the sway of Napoleon in Germany, he edited the *Haude und Spener'sche Zeitung*.

**BENDEMANN, EDUARD**, a German painter, born of Jewish parents, at Berlin, Dec. 3, 1811. He studied at Düsseldorf. His first work that attracted much notice was "Boaz and Ruth." In 1832 he gained a wide reputation by his picture of the "Jews by the rivers of Babylon." Among his other paintings may be mentioned "Jeremiah on the ruins of Jerusalem," the "Harvest," and other smaller pictures. Bendemann has also distinguished himself as a portrait

and fresco painter. In 1838 he was appointed professor at the academy of fine arts at Dresden, and intrusted with the execution of some important works in fresco in one of the royal palaces of that city.

**BENDER**, a fortified town in Bessarabia, on the right bank of the Dniester, 48 miles from its mouth. It has a citadel with 600 artillerymen. Near it is Varnitza, the retreat of Charles XII., after the battle of Poltava. Bender was taken by storm by the Russians in 1809, but was restored to Turkey at the peace of Jassy. In 1812 it was ceded to Russia. It has 7 gates, 12 mosques, and an Armenian and Greek church. Pop. 5,000.

**BENDING MACHINE**. One of the greatest difficulties that shipbuilders have to contend with, is procuring timber of the proper shape. In some parts of Europe officers are appointed to find out and mark the trees which are fit for the use of the navy, whether they stand on public or on private ground, and henceforward it becomes an offence, punishable by fine, for the proprietor to fell them. The knees are particularly difficult to procure, for a great number are wanted, nearly all of them of different angles, and each has to be cut from a tree at the junction of 2 branches forming the angle wanted. The ribs are seldom found in nature, and are made of several pieces joined together at a considerable expense. Efforts have been made at various times to substitute artificially curved wood for that grown with the proper shape. The following titles of patents are found in the records of the U. S. patent office: Timber bending for boats, J. Orbison, Piqua, O., 1820; the same, Green and Blakesley, Litchfield, Conn., 1822; Bending masts and truss hoops, J. Milford, Northern Liberties, Penn., 1835; Bent timber for ships and for knees, in 2 patents, W. Ballard, New York, 1854; Machine for bending wood, E. Updegraff, York, Penn., 1856; the same, T. Blanchard, Boston, Mass., 1856; the same, Edwin and Artemas and Cheney Killburn, Burlington, Vt., 1856. Several of these patented machines are intended for small pieces of wood, others for large timber. In all, the wood is first rendered soft by wetting and warming it over a fire, or by warming it in steam. It is then placed in the machine, which bends it into a shape that the wood retains after cooling. When the timber is large the fibres on the convex part of the curve are much extended, and those in the concave are much compressed; the result is a tendency to split; this is prevented by so constructing the machine that the wood is compressed on all sides and at both ends during the operation. A company has been formed in New York, under the title of the "American Timber-bending Co.," with workshops near the city. They have been at work but a short time, and are now engaged in putting up machines of an increased size. Timbers bent by the company have been submitted to experiments to test their strength, and it is claimed

that they have been found much stronger than similar pieces of natural growth. This result is not improbable, and is much to be desired, but it is not yet accepted by all naval engineers.

**BENDISH, BRIDGET**, the granddaughter of Oliver Cromwell, of England, and the daughter of Gen. Ireton, born about 1650, died 1727. In her early years she was brought up at Cromwell's court, and was present at the audiences he gave to foreign ambassadors. She bore a wonderful resemblance to the protector, physically and morally; her energy was immense; she would work for days together without sleeping; had uncommon conversational powers; was liable to periodic attacks of religious ecstasy; and managed her salt-works at Southtown, in Norfolk, with great exactness. By her open-handed benevolence she was popular with the poor. She could never bear to hear her grandfather evil spoken of, and one day when travelling in the stage-coach, a tory squire so committed himself, not knowing in whose presence he was; she jumped out at the next stage, snatched a sword from another fellow-passenger, and challenged the royalist gentleman to a duel. She would sometimes drive her carriage into Yarmouth, and spend an evening at the assembly rooms in that city, where her princely manners, venerable aspect, and imposing energy of voice and manner, recalled the protector to the eyes of a generation who knew him only in the distance of history, and made her the lion of the evening. A memoir of her by a local physician has been preserved, and even been translated into French, by Guizot.

**BENEDICT**, the name of several popes of the Roman Catholic church. **I. BENEDICT II.**, elected in 684, was a Roman, remarkable for scriptural science, piety, and kindness to the poor. He caused the decrees of the sixth general council (against the Monothelites) to be accepted by the Spanish bishops, and also induced the Greek emperor to give up the usurped right of confirming the election of the pope. Constantine IV. sent him some locks of the hair of his sons, Justinian and Horatius, signifying thereby that he recognized him as their adopted father. This pope reigned one year, and died May 6, 685. **II. BENEDICT III.** (855), a Roman, and cardinal priest, is praised even by Photius for meekness and benevolence. He signalized himself by zeal in building and beautifying churches in Rome, and in unison with Ethelwolf, king of the Anglo-Saxons, established an English college in Rome. He confirmed the deposition of Gregory, the unworthy bishop of Syracuse, pronounced by Ignatius, patriarch of Constantinople, which was the occasion of the subsequent deposition of Ignatius and intrusion of Photius in his place, and of the Greek schism. He died April 8, 858. **III. BENEDICT VII.** (975), of the counts of Tusculum, and bishop of Sutri, reigned during 9 years with great ability and firmness. He was chiefly remarkable for his labors in establishing

canon law, and upholding ecclesiastical discipline. **IV. BENEDICT VIII.** (1012), also of the counts of Tusculum, and cardinal bishop of Porto. The celebrated German emperor, St. Henry, and his wife, St. Cunegunda, were crowned by him. He made 2 visits to Germany, during the latter of which he received the city of Bamberg as a present, afterward exchanged for Benevento. During his reign the Saracens attacked the pontifical states, but were defeated and driven away by the troops of Benedict, after a bloody and obstinate battle of 8 days. Pope Benedict introduced the custom at Rome of singing the Nicene creed during mass. After a very active and vigorous reign of 12 years, he died during the early part of the year 1024, and was succeeded by his brother, under the name of John XIX. **V. BENEDICT XI.** was of humble origin, and became at an early age a member of the Dominican order, in which he was promoted to the rank of general solely on account of his learning and piety. For the same reason he was afterward made cardinal bishop of Ostia, and frequently employed in important legations. He was a devoted and courageous partisan of his predecessor, Boniface VIII., and remained with him at Aragni, after all the other cardinals had fled. On the death of Boniface he was unanimously elected to succeed him (1308), and very soon settled all the difficulties between France and the holy see. This pope was remarkable for humility, and his great talent for pacification. On one occasion, when his mother presented herself at his court splendidly attired, he refused to recognize her until she had resumed the dress suitable to her humble state of life. He died at Perugia, in 1304, probably by poison. **VI. BENEDICT XII.**, a Frenchman by birth (Jacques Fournier), of humble origin, was a Cistercian monk, and afterward, successively, abbot, bishop, and cardinal. He was the third of the Avignon popes, having succeeded John XXII., in 1334. He was an eminent canonist and theologian, and has left several valuable works. As pope, he was animated by a great zeal for reformation, and was very severe on negligent and ambitious ecclesiastics. He defined, by a constitution, the doctrine previously construed by some, that the beatitude of the just, and the punishment of the wicked, commence before the final judgment. He died at Avignon in 1342. **VII. BENEDICT XIII.**, of the princely house of Orsini, born in the kingdom of Naples, became at an early age a Dominican, and, throughout his whole life, was remarkable for the strictness with which he fulfilled his religious duties. Having been with great reluctance elevated to the dignity of bishop and cardinal, he continued to live as a simple monk, and devoted all his leisure hours to study, writing, and prayer. As a bishop, he was devoted to his pastoral duties, and universally loved and venerated; and as cardinal, he led what was called the party of the Zelanti, who were pledged to vote at the conclave for the candidate deemed by the col-

lege of cardinals the most worthy, without regard to any worldly or political interest. He was chosen to succeed Innocent XIII., A. D. 1724, and accepted the papal dignity under obedience to the command of the general of his order, with many tears. The well-known saints, Aloysius de Gonzaga, John of the Cross, John Nepomucen, and Stanislaus Kortka, were canonized by him. His principal efforts were directed to restore and uphold ecclesiastical discipline, although he was deceived by a hypocrite named Nicholas Coscia, who abused his confidence, and was imprisoned for mal-administration by his successor. He died Feb. 21, 1730. **VIII. BENEDIOT XIV.**, the most distinguished of all the popes of this name, and one of the most able and learned popes of modern times. His name was Prospero Lorenzo Lambertini, and he was born of an ancient family at Bologna, A. D. 1675. From his youth he devoted himself to study and science, especially to canon law and theology, and became a voluminous author, his works being regarded as standard. After a long, useful, and laborious career, in different offices of the Roman prelature, he was finally made, in 1728, cardinal priest, and archbishop of Ancona, by Benedict XIII. In 1731, Clement XII. transferred him to Bologna, where he remained until his election to the papacy, which took place, most unexpectedly, Aug. 17, 1740. He was then 65 years of age, and he reigned 18 years. As pope, he was highly esteemed by all the contemporary sovereigns, Protestant as well as Catholic. During the intervals of public business he contrived to apply himself to his favorite studies, and maintained a correspondence with all the most eminent writers of the day. He was a great patron of science, learning, the fine arts, and charitable institutions. His quiet, tranquil life, full of great and good works, but devoid of striking and remarkable events, presents but few salient points. The unanimous judgment of mankind, however, pronounces him a great and good man. The complete collection of his works fills 15 folio volumes. He died May 2, 1758.—**BENEDIOT**, antipope, a native of Aragon; he styled himself Benedict XIII. His name was Pedro de Luna, and in his early life he was alternately a student and a soldier. He finally chose civil and canon law as his profession, and was professor of these departments at the university of Montpellier, when Gregory XI. made him cardinal. He was a man of eminent talents, and Pope Clement VII. sent him as legate into Spain. He was the patron of the celebrated St. Vincent Ferrer, who adhered for a considerable time to his obedience. In 1394, a portion of the cardinals at Avignon elected him pope, with the previous engagement to resign if the peace of the church required it. France, Spain, and some other portions of Christendom, acknowledged his obedience at first. Afterward, when the councils of Pisa and Constance, and the different

sovereigns who had supported him, required him to resign his claims to the papacy, he refused. Both councils condemned and excommunicated him as a schismatic, and the princes of his obedience abandoned him, and endeavored to take him prisoner at Avignon. He escaped, however, to Chateau-Renard, and afterward to Peniscola, a little town in the kingdom of Valencia, where he played the part of pope, with two cardinals, until he died in 1424, at the age of 90. He obliged his two cardinals to elect, as his successor, Gil Muñoz, a canon of Barcelona, who took the name of Clement VIII.

**BENEDIOT**, abbot of Peterborough, an English monk and historian, died in 1193. He studied at Oxford, became prior of the monastery of Christ church in Canterbury, shared the friendship both of Becket and King Henry, assisted at the coronation of Richard I., the Lion-hearted, under whom he was keeper of the great seal, and wrote histories which are still extant of Thomas à Becket, Henry II., and Richard I.

**BENEDIOT, SAINT**, born at Nursia in Umbria, A. D. 480, died March 24, 543. This patriarch of the western monks seems to have had an irresistible desire for contemplation, solitude, and the monastic life, from his childhood. His parents sent him to Rome to study, but his gentle, reserved, and modest temper, caused him to be disgusted with the vices and temptations he found there, and he fled to the desert of Subiaco, between Tivoli and Sora, where he commenced an eremitical life. After a time, he could no longer conceal himself or hinder a great number of persons from resorting to him, attracted by his sanctity and wisdom. He finally built a monastery on Mount Cassino, where there had formerly been a temple of Apollo. Here he laid the foundation of the Benedictine order, and presided as abbot during 14 years. There is still an extensive monastery on Mount Cassino, which is a favorite place of pilgrimage.

**BENEDIOT, JULIUS**, a German composer, born at Stuttgart, Dec. 24, 1804, of a Jewish family. Having shown an unusual talent for music, he was placed, while a boy, under the tuition of Hummel, with whom he made rapid progress. In 1820 he was so fortunate as to attract the notice of Carl Maria von Weber, who, contrary to his usual practice, willingly received him as a pupil into his house at Dresden, where he remained until the end of 1824 in the most intimate and affectionate relations with his illustrious master. At 20 years of age, on the recommendation of Weber, he was engaged to conduct the German operas at Vienna, whence, in 1825, he went to Naples to become musical director of the theatres San Carlo and Fondo. He remained here for nearly 10 years, and produced, among other works, "Giocenta ed Ernesto," "I Portoghesi in Goa," and "Un Anno ed un Giorno," which were too German in style to please an Italian public, although

some of them were subsequently performed in Germany and England with great success. In 1835, in accordance with a long-cherished desire, he visited England, where his reception was so flattering that he has continued to reside there ever since. After filling the position of musical director at the Lyceum theatre, in London, for 2 years, he turned his attention to the English musical stage, and in 1838 produced the "Gypsy's Warning," in 1844 the "Brides of Venice," and a year or two afterward, the "Crusaders," all of which were quite successful. In 1850, he accompanied Jenny Lind on her musical tour through the United States, as director of her concerts, of which the orchestra, drilled and conducted by him, was always a marked feature. Since his return to Europe he has resided generally in London, and is frequently before the public as director of some one of the great musical festivals which annually take place in various parts of England. Beside the works mentioned, Benedict has composed much music for the piano-forte, on which he is an admirable performer, and a number of orchestral and vocal pieces. His music is spirited, dramatic, and melodious, and so completely has he assimilated his style to English tastes, that he is considered more national than many native composers.

**BENEDICT-BEUERN**, a village of Bavaria, in the circle of upper Bavaria, noted for having once contained a Benedictine abbey, founded in 740. It has glass works of some celebrity, and quarries of marble. The village is situated in the neighborhood of the offshoots of the mountains of the Tyrol, one of whose summits, not far from the village, has an altitude of more than 6,000 feet.

**BENEDICTINE ORDER**, the most ancient and widely spread religious order of the western church, founded by St. Benedict. The monastic institution, which originated in the East, had taken root also in the West before the time of St. Benedict, chiefly through the influence of St. Athanasius and other prelates, who were either orientals or had visited the oriental monasteries; and also through the profound impression created by the life of St. Anthony. It was necessary, however, to modify very much the customs of the eastern anchorites, and to adapt the monastic rule to the character and habits of the people of the West, and also to their different climate. It was also requisite to introduce some regularity, and a fixed system of government, among the separate and disconnected religious communities. The rule of St. Benedict was accordingly drawn up by him, and generally adopted. His order spread rapidly and widely throughout western Christendom, and in its most flourishing period numbered 87,000 abbeys. In the reign of Henry VIII. there were in England 28 mitred abbots and 1 prior of the Benedictine order, who were peers of the realm, and sat in the house of lords. From this order have proceeded 24 popes, 15,000 bishops, and 40,000 canonized or beatified saints,

among whom are some of the most illustrious men that adorn the annals of the church, as, for example, St. John of Damascus and St. Bernard. It has had also among its members many imperial and royal princes, nobles, statesmen, and eminent warriors, who have retired from the world to the shadow of its peaceful walls. The rules of the Benedictine order are very few and simple, giving it a great flexibility, and power of adaptation to different countries and times. Hence we see it undergoing very great changes and modifications, and shooting out many branches from its parent trunk. From the beginning, the Benedictines devoted themselves very much to sacred science; and from an early period they also commenced a zealous cultivation of every branch of human learning and the fine arts. With these intellectual pursuits they united those of agriculture and gardening. This cultivation of science caused the custom to be early introduced of ordaining the Benedictine monks to the priesthood, contrary to the previous usage. For several centuries they were also the principal teachers of youth in all the branches of education, from the lowest to the highest, and possessed a vast number of colleges and schools. To their care and laborious copying of MSS., the world is indebted for the preservation and transmission of the entire body of classical and other ancient learning through the dark ages. In the ordinary course of things, the order became very rich and powerful, and following the general law of human institutions, fell to a considerable extent into a state of decadence from its primitive ideal. We therefore find, from the 9th century downward, very frequent and stringent measures of reformation adopted by popes, councils, and prelates, and, to a considerable extent, accepted and carried out within the bosom of the order. Reformers also sprung up within the bosom of the order itself, and new Benedictine families were formed on the basis of the ancient rule and discipline. One of these reformers was St. Benedict of Anani, called "the second Benedict," who died 821. The principal branches of the great Benedictine family which have sprung up in the course of ages, are, the Clunians, Cistercians, Camaldolese, Vallombrosians, Grammontensians, Carthusians, Fontevraudians, Bernardines, Gilbertines, Humiliati, Cœlestines, Feuillants, Trappists, Olivetans, and Benedictines of St. Maur. The latter are well known for their learned and magnificent edition of the fathers. —The number of Benedictine monks of the original stem, at the present time, is estimated at 1,600, and their chief seat is Monte Cassino. There is a large Benedictine community at Youngstown, in Pennsylvania, which is rapidly increasing, and has already sent out several smaller colonies. There are also two Trappist monasteries in the United States, one in Kentucky, the other in Iowa, each governed by a mitred abbot. The Trappists and Carthusians are the severest of all the Latin religious orders, and still preserve all their original

strictness and rigor.—BENEDICTINE NUNS have existed from an early period, and claim St. Scholastica, sister of St. Benedict, as their foundress, with great probability, although some dispute the existence of female convents under the Benedictine rule during the lifetime of St. Benedict. They have been widely spread in former times, and have undergone the same changes and revolutions as their parent order. At one time there were many convents into which only noble ladies were admitted, and these became so far secularized that they even ceased to take any vows, and left the order, and even married whenever they chose. Every reformed congregation of Benedictine monks usually had also female convents under its direction, which adopted a similar discipline. Two remarkable reformations sprung up in the female order itself, one under the direction of the high-born and saintly abbess, Antoinette of Orleans, who founded the congregation of Our Blessed Lady of Mount Calvary, in the 17th century; the other in the same century, under the abbess Mechtildis, who founded the congregation of the Perpetual Adoration.

BENEDICTION, the act of blessing, of wishing to a person or thing the grace of God. It has always existed as a custom among Jews and Christians. The Jewish priests bestowed benedictions upon the people when they remained obedient to the law, and maledictions when they neglected it. The patriarchs, when near their death, invoked blessings upon their children and family, and at the same time pointed out the son who should succeed as head of the family and tribe. The children of Israel having arrived in the promised land, were assembled between the mountains of Ebal and Gerizim, and from the summit of Gerizim benedictions were pronounced upon those who should observe the duties of religion; and from the top of Ebal, maledictions upon those who should violate them.—In the Roman Catholic church, benedictions are of several kinds, and are performed either by sprinkling holy water, by signs of the cross, or by appropriate prayers. Some are bestowed upon persons endowed with authority, or devoted to certain estates, as kings, queens, abbots, abbesses, virgins, knights; others upon objects used in worship, as vases, linens, ornaments, churches, cemeteries, water, oil; others upon objects of eminent use to men, as houses, ships, the sea, rivers, railroads, fire-arms, the nuptial ring, gardens, fountains, flocks, and fruits of the earth; and others, by the superior ecclesiastics, upon Christian people. Three times a year, from the balcony in front of St. Peter's, the pope solemnly gives his benediction, *urbis et orbis*, to Rome and to the world. The benediction of the Blessed Sacrament is one of the most solemn functions in the Roman Catholic church. The consecrated host is exposed on an elevated throne above the altar, being placed in an ostensorium for that purpose. Many lights are burn-

ing, incense is offered, hymns and prayers are sung, and finally, the priest blesses the people, by making the sign of the cross over them with the ostensorium. This ceremony is specially prescribed in Corpus Christi, but is used now very frequently in other festivals, and in many churches every Sunday after vespers.—In Protestant churches, the benediction is usually given in words similar to those prescribed by Moses to Aaron. It is often accompanied with laying on of hands, especially in the celebration of marriages, the ordination of pastors, the confirmation of converts, and the baptism of children.

BENEFICE (Lat. *beneficium*), an ecclesiastical living, originally including every species of preferment, as well those to which dignities and offices were attached, viz., bishoprics, deaconries, and prebends, as the lesser sort, viz., rectories, vicarages, perpetual curacies, and endowed chaplainries; but in its popular acceptance it includes only the latter class, and the distinction is recognized in recent acts of parliament. The name is derived from the *beneficium* of the Romans, which was a grant of an estate, privilege, or endowment of any kind to a subject by the sovereign. It was afterward the designation of a grant of land by any large proprietor to a retainer or follower as a reward of services, being the same that later was denominated a fief or fee, the essential incident of which was perpetuity, that is to say, it was a permanent stipendiary estate held of a superior, and usually subject to some condition indicating vassalage. The principle of the feudal tenure was applied, in the middle ages, to ecclesiastical benefices to this extent, that they were held of the pope, as a superior lord, though these benefices had not the hereditary character of a fee, so far as respected the office or dignity connected therewith, and the lands or emolument conferred by a grant were usually attached to such office or dignity, and on the death of the incumbent, reverted to the ecclesiastical superior who was entitled to appoint a successor. This, at all events, was the claim of the popes, though it was the subject of contest between them and the principal European sovereigns. When the term came to be applied to ecclesiastical grants, it was gradually disused in respect to all others, and the *feodum*, fee, was substituted.

BENEFIT OF CLERGY, in English criminal law, the *privilegium clericale*, exemption of the clergy from penalties imposed by law for certain crimes. This privilege no longer exists, but it was for many centuries an important element in the administration of criminal law, and still is a curious and instructive part of the history of England. The origin of this privilege was a claim made by the ecclesiastics at an early period for the entire exemption of their order from the jurisdiction of the common law courts. Before the Norman conquest, in the county courts, where the greater part of the civil business of the kingdom was trans-

acted, the bishop of the diocese presided with the sheriff, thus uniting civil and ecclesiastical authority, but the foreign clergy who came over with the Normans, and were installed in the chief preferments of the English church, obtained from William the Conqueror a separation of ecclesiastical courts from the civil. In the reign of Stephen, a still further innovation was made by giving sole jurisdiction to the bishop over ecclesiastical persons and causes. This gave rise to the contest between spiritual and temporal courts, and the breach was continually widened by jealousy of the Catholic clergy. The claim of exclusive jurisdiction was not successfully maintained, except in respect to ecclesiastical causes, but by various statutes and the popular regard for the church, which imposed some check upon the most arbitrary monarchs, the persons of the clergy were exempted from penalties for certain crimes; but though there was a constant struggle on the part of the clergy to assert this exemption on the ground that the clergy were amenable only to the ecclesiastical courts, it was as steadily resisted by the common law courts, and the privilege was allowed only in the cases specifically provided for by common law or statute. It is not easy in the conflict of jurisdiction, and the varying legislation of parliament, to determine how far the exemption existed by common law and how far it was enacted by statute. It did not extend to all crimes; and the distinction made can hardly be explained upon principle, but seems to have been in some degree arbitrary, or, perhaps, a compromise. Thus it was not allowed in high treason, nor in petit larceny, nor any mere misdemeanor (by which was meant petty crimes less than felony), and was, as a general rule, allowable only in capital felonies, but not all even of that class. The exemption was mainly founded on statute 25 Edward III., by which it was provided that clerks convicted for treason or felonies touching other persons than the king himself, should have the privilege of holy church. By the common law, benefit of clergy was denied in 8 kinds of felony, viz.: lying in wait for one on the highway (*insidiatio viarum*), ravaging a country (*depolutio agrorum*), and burning of houses (*combustio domorum*); and in all these cases, even after the statute above mentioned, the privilege continued to be denied. From time to time it was enacted afterward, in various statutes, that certain crimes should be without benefit of clergy, as murder, rape, burglary, larceny from the person, or from a dwelling house, any one being therein, and many other offences. As to the persons entitled to benefit of clergy, it was originally limited to such as had the *habitus et tonsuram clericalem*, that is, the regular clergy; but the claim being made in behalf of the retainers of ecclesiastics, and other laymen, who were not entitled to it, a test was adopted that only such as could read should be allowed the privilege. But, in the reign of Henry VII., it was

found that as many laymen as divines had by this test an exemption, and a law was then passed making a distinction between lay scholars and such as were in orders. The former were to be admitted but once to the benefit of clergy, and were to be subjected to a slight punishment, as burning in the hand, or perhaps this was merely intended as a permanent mark of having once had the benefit of clergy, so that the person should not be admitted to claim it again. The distinction was abolished in the reign of Henry VIII., but revived again by statute 1 Edward VI., by which it was also enacted that peers having a place in parliament should have the benefit of peerage, equivalent to that of clergy, for the first offence, although they could not read, and without being burnt in the hand, for all offences then clergyable to commoners, and also for the crimes of housebreaking, highway robbery, horse-stealing, and robbing of churches—a significant intimation of the state of morals among the highest nobility in that era. In the duchess of Kingston's case, it was held that peeresses were entitled to the benefit of the statute. The ordinary course when a claim was made to benefit of clergy was, after burning in the case of the laity, and without it in case of the clergy, to deliver the prisoner over to the bishop to be dealt with according to the canon law. Then followed a purgation, as it was called, that is to say, the offender was called before the bishop and required to make oath of his innocence, which was to be maintained by the oaths of 12 witnesses, called compurgators, that they believed him, upon which he was acquitted. This was the general result. The scandalous perjury and prostitution of the forms of legal proceedings exhibited in this mock purgation, induced the temporal courts to avoid it altogether, by delivering over the convicted clerk *absque purgatione facienda*—the effect of which was that he could not be relieved from other legal consequences of his crime, except the punishment of death. It was in consequence enacted by 18 Elizabeth, that the offender should be delivered out of prison with a proviso that he might, in the discretion of the judge, be kept in gaol a year. Thus the law continued for a long period without alteration, except the extension to all commoners not in orders, of the benefit of clergy in clergyable offences, subject, however, to being burned in the hand and imprisoned for a year. All these provisions of law still required, as the condition of exemption, that the person claiming exemption should be able to read, so that those who could not read (except peers) were hanged, to remedy which unequal severity it was enacted by 5 Anne that the benefit of clergy should be granted to all who were entitled to ask it without requiring them to read. Finally, by statutes 7 and 8 George IV., which is a revision of all the previous acts relating to crimes, the benefit of clergy was entirely abolished. In the United States this privilege

has never been recognized as existing. There is a single statute (act of congress, April 30, 1790), in which it is provided that benefit of clergy shall not be allowed for any offences punishable by death.

**BENEKE, FRIEDRICH EDUARD**, a German philosopher, born in Berlin, Feb. 17, 1798, found, after a long disappearance, drowned in a canal at Charlottenburg, June 4, 1858. After serving as a volunteer in the campaign of 1815, he studied theology and philosophy at Halle and Berlin, giving special attention to the English philosophers. In 1820 he lectured in the university of Berlin as a private teacher, but the continuance of his lectures was forbidden in 1822, on account of his departure from the philosophical principles of Hegel. He then taught for a few years in Göttingen, but, returning to Berlin in 1827, he then received permission to lecture in the university, in which he was elected extraordinary professor of philosophy after Hegel's death, in 1832. The starting point of his system is, that philosophy must be founded upon a strict and careful examination of the phenomena of consciousness. He thus adopts, in mental philosophy, the method observed by Bacon in the natural sciences, and his system is described as an empirical psychology.

**BENEVENTE**, a seaport town of Brazil, province of Espirito Santo, 47 miles S. of Victoria, at the mouth of the river Benevente, on the Atlantic.

**BENEVENTO**, a city of southern Italy; pop. 16,300; capital of the Roman delegation of Benevento. It is situated 82 miles N. E. of Naples, on elevated ground, near the confluence of the Calore and Sabato, and is built of the ruins of an ancient town, of which it occupies the site. It abounds in remains of antiquity. It has the arch of Trajan, now called the Golden Gate. This city, supposed to have been founded immediately after the Trojan war, was conquered by the Romans in 269 B. C., who, having just defeated King Pyrrhus beneath its walls, gave to it the name of *Beneventum*, or fortunate event. It belonged for a time to the Byzantine empire, but was taken by the Goth Totila in 545, and by the Lombards in 589, under whom it became the capital of a duchy. After the fall of the Lombard kingdom, it recovered its independence, but suffered many attacks from the Saracens, and was captured by the Norman chief, Robert Guiscard, in 1077, who transferred it to the pope. Four councils of the church were held here in the 11th and 12th centuries. In 1806, Napoleon instituted it a principality for Talleyrand. It was restored to the pope in 1815. In 1266, near Benevento, was waged the battle in which Charles of Anjou defeated Manfred, king of Naples. The delegation of Benevento contains an area of 90 sq. m., and a population of 20,500.

**BENEVOLENCE**, a system of loan to the crown without the sanction of parliament practised by several British monarchs, in defiance of *Magna Charta*. Henry VII. levied it successfully. Elizabeth tried it, but wisely withdrew

from the contest with her subjects. James I. raised the doctrine of prerogative to a higher pitch than had ever been tried, and Charles I., by his royal exactions, dispensing with the power of the parliament, and by imprisoning the recusants, brought upon himself all the calamities of his life. The petition of right disclaimed the king's authority to levy taxes without the consent of parliament, and the bill of rights, in 1688, renewed its provisions, and placed the power of the purse in the hands of parliament.

**BENEZET, ANTHONY**, an American philanthropist, a native of France, born at St. Quentin, in the province of Picardy, Jan. 31, 1718, died in Philadelphia, May 5, 1784. He was of a wealthy and noble Protestant family, which fled from France to Holland, and thence to England, in 1715, after the revocation of the edict of Nantes. In London the family adopted the religious opinions of the Quakers, and they removed from that city to America in 1731. Young Anthony was placed by his parents in a counting-house, but finding that commerce offered temptations to a worldly spirit, he left his master, and bound himself as an apprentice to a cooper. Finding this business too laborious for him, he declined it, and, in 1742, accepted the appointment of instructor in the Friends' English school, of Philadelphia. The employment of a teacher of youth accorded with his inclination, and he cheerfully devoted to it the greatest part of his life. "Few men," says Dr. Rush, "since the days of the apostles, ever lived a more disinterested life." One of the first objects of his enthusiastic philanthropy was the abolition of the slave-trade, and the emancipation and education of the negroes. To this end he opened an evening school in Philadelphia for the negro population, and published several valuable tracts. His style was forcible and fervid, and he distributed his works at his own expense throughout every part of the United States, and sent letters directly to the queen of Great Britain and the queen of Portugal, begging them to use their influence to abolish the African trade. He was interested, also, in behalf of the aborigines of America, and urged the adoption of measures for their civilization and Christianization. During the terrific campaigns of Frederic the Great, of Prussia, he wrote a letter to that monarch, in which he endeavored to convince him of the unlawfulness of war. While the British army was in possession of the city of Philadelphia he was indefatigable in his efforts to relieve sufferings, and his courage and gentleness secured the civilities and respect of the British and German officers, even when they were unable to grant his requests. So great was his sympathy with every thing that was capable of feeling pain that he resolved, toward the close of his life, to eat no animal food, and this misapplication of a moral feeling was, probably, the cause of the disease of which he died. He resigned his school 2 years before his death, in order to devote himself wholly to the instruction of the blacks, and, after the death

of his widow, he bequeathed his entire estate for the support of a school for the education of negro children. His funeral was attended by persons of all religious denominations, among whom were several hundred negroes. The worth of Benezet's writings is alluded to by the British philanthropist, Clarkson, who confesses that one of them enlightened his own mind and quickened his zeal in the early part of his life. The character, at once acute and benevolent, of Benezet, is revealed in his remarkable saying, that "it is the highest act of charity to bear with the unreasonableness of mankind."

BENGAL, one of the 3 presidencies of British India, and the most important division of Hindostan. In 1854, excludng the possessions of the native princes, the presidency was estimated to contain 225,000 sq. m., lying between lat. 10° and 28° N., and long. 83° and 99° E. Since then large accessions of territory have been made, one of the latest of which is derived from the mediatisation of the king of Oude.—The province of Bengal, lying almost entirely within the tropics, is subjected to great extremes of heat, the climate having proved more dangerous to Europeans than almost any other in British India. Sanatoriums have, however, been established among the mountain regions of northern India, to which invalids are accustomed to retire and enjoy the bracing airs which there visit them, as in a temperate zone. Many years ago, Calcutta, situated in the south-eastern quarter of Bengal, was considered one of the most unhealthy spots on the globe, but, in the course of time, a temperate and regular mode of living, and better knowledge of the diseases of the country, have been introduced, while, by the draining of marshes, cutting of canals, clearing the grounds of trees and jungle, the climate has been greatly improved. The seasons in Bengal are commonly divided into the hot, cold, and rainy, the hot season setting in in March and continuing to the end of May, when the weather becomes nearly intolerable, even to the native. The thermometer frequently rises to 100°, and even to 110° F. During this period the troops are not employed on active service if it can be avoided, and it is often found among those merely standing on guard that their dresses are dripping wet with perspiration at midnight. In the middle parts of Bengal this terrific heat is mitigated by occasional thunder storms, with rain and hail, but in the districts contiguous to Bahar a scorching west wind blows during the whole season. The rainy season begins in June and lasts 4 months. The rain is heavy and constant; as much as 5 inches has sometimes fallen in one day, and during the last 2 months alternate fogs and rains prevail, rendering the state of the atmosphere indescribably unpleasant. The setting in of the S. W. monsoon, about the beginning of June, is accompanied by awful thunder and lightning. The cold season, from November to the latter part of February,

is pleasant, the thermometer often sinking as low as 70° F.—The general aspect of Bengal is that of a level country, intersected by numerous rivers and encompassed by lofty ranges of mountains. That part of the Delta watered by the Ganges as it approaches the sea is a perfect labyrinth of creeks and rivers, of jungle and stagnant waters, called the Sunderbunds, a region infested with tigers, and producing inexhaustible supplies of timber. At the annual inundation this region presents the appearance of a vast inland sea, when a curious spectacle is displayed to the stranger, of fields for hundreds of miles covered with water, the rice rising above it, the enormous dikes built to restrain the floods, and the boats floating in immense numbers. This region, lying between the rivers Hoogly and Chittagong, abounds in quantities of salt sufficient for the entire wants of Bengal. Into these Sunderbunds the waters of the 2 mighty rivers, the Ganges and the Bramapootra, meeting, pour their streams, after traversing Bengal in opposite directions, from points 1,200 miles asunder. Many navigable streams pour into these rivers, affording the most ample internal communication.—The soil of Bengal in general is a mixture of clay with sand, fertilized by various salts and an immense quantity of decayed animal and vegetable substances. It is a rich black mould, very deep, and loose in its texture, bearing incontestable proof of a country redeemed from the sea, as the bed of sand on which it lies contains shells, and frequently pieces of rotten wood. Even boats and anchors, buried at some remote period, have been found. The whole of the soil of Bengal is characterized by amazing fertility, and this quality, in no little degree, is owing to the annual inundation of the Ganges and other great rivers. The lands are very easily cultivated, and yield prolific crops without any manuring beyond that deposited by the inundation. The principal crop is rice, but very good wheat and barley are grown, and various kinds of pulse are raised in great abundance, such as peas, kidney beans, &c., while maize, millet, and other small grains, the food of the poorer classes, are generally sown, especially in the hill regions of the west, and the immense and universal consumption of oil by the natives causes the cultivation of mustard, sesamum, linseed, &c., to be largely attended to. Bengal husbandry, among the natives, is still in a very primitive state. The plough is a rude contrivance, drawn by one pair of oxen, who are relieved by others until the day's ploughing is completed. Weeding, after the crops have risen above ground, is performed by means of a short spade, the laborers sitting down to their task. There are 2 seasons of reaping, one in April, called the little harvest, for the smaller grains, and the great harvest, which is wholly for the rice, of which, however, there are 3 crops sometimes in a year. Different crops are sometimes sown together in one field, which are greatly injured by successive ripening and gathering. After the corn of all kinds is reap-

ed, it is piled up in the fields without any defence from the weather, until the husbandman finds it convenient to thrash it out. The grain, after winnowing, is stowed away in unbaked earthen jars or baskets of twigs, in round huts, with their floors elevated a foot or two above the surface of the ground to exclude the dampness. But, with all the fertility of the soil and favors of the climate, agricultural knowledge stands at a very low point in Bengal, as in other parts of India. No sufficient care is bestowed, either on the selection of grain or the best time of sowing. The implements are few and imperfect, the rotation of crops little understood, no manure is applied, except to the sugar-cane, mulberry, poppy, and tobacco. The dung of animals is not collected, but used for fuel. The country is without enclosures, and the roads are usually in wretched order. The principal vegetable productions, beside grain and pulse, are tobacco, cotton, indigo, mulberry, poppy, plantains, pumelos or shaddocks, limes, oranges, pomegranates, pineapples, bananas, the banian tree, the cocoanut, which supplies a kind of cordage made from the fibres of its palm, sugar-cane, which thrives exceedingly well, the betel vine, which produces the betel pepper, mangoes, date trees, the areca, &c. The potato has been introduced and cultivated with much success. There are also many kinds of flourishing shrubs, which either grow wild or thrive with very little care. The most important of the commercial crops are those of tobacco, the opium poppy, sugar, indigo, cotton, and silk. Coffee has also been successfully introduced, and tea is largely cultivated in the districts of Assam. Immense plantations have been stocked with tea-plants from China, and laborers imported from the green and black tea countries of the celestial empire. Mr. Robert Fortune's efforts in this respect have been worthy of all praise, and there is every reason to believe that the cultivation of tea will annually increase, and become a very important item in the Indian revenue. Tobacco was not known in India until after the discovery of America, but is now grown everywhere. Sugar-cane, on the contrary, has been cultivated in Bengal from remote antiquity, and there is now scarce a district in which it is not grown; it is cheaply manufactured, and now enters English markets on the same terms with that of the West Indies. Indigo is a very important article, of which Bengal supplies about five-sixths of the production of the whole world. Cotton is abundantly raised, but the demand is equal to the supply, and it cannot at present at all compare with the product of the American states. Silk has been produced in Bengal for many centuries, the knowledge of it having doubtless been introduced from China. The raw material was at first carried to Europe, into Greece and Italy, from India, and the first silk manufactories known in Europe were established in Greece, by the emperor Justinian. Wild silk-worms are found in countries border-

ing on Bengal, from which a coarse species of silk is produced, but by no means equal to that of the domesticated insect. The cultivation of the poppy is entirely a government monopoly, contracts being annually formed with poppy growers to sow certain lands with the plant, and deliver the opium to the government, at a set price. The plants are sown in November, arriving at maturity by Feb. 2. The opium produced in Bengal alone, amounts to the sum of \$10,000,000 to \$15,000,000 annually.—Wild animals abound, such as boars, bears, wolves, jackals, foxes, hyenas, leopards, panthers, tigers, lynxes, hares, deer, zebras, wild buffaloes, antelopes, apes and monkeys, and elephants, the last of which are domesticated in great numbers, and prove eminently useful for military and civil purposes. The royal Bengal tiger is best known of all the untamable animals of India; it appears to have been familiar to the ancient Romans, and is described by Seneca as *Gangetica tigris*. It is of an immense size, and such prodigious strength that it can readily carry off a bullock. The native horses of Bengal are thin and ill-shaped, but those in use among the rich natives and the Europeans are of Persian or Arab stock, and are valued highly. The breeds of cattle and hogs are poor; goats and sheep thrive better, but the latter are small and lank, with coarse, thin, and hairy wool. Game, poultry, and various kinds of water-fowl, are found in the greatest abundance; ducks of many varieties of excellence, and the common domestic fowls of Europe, run wild in the jungles. Crows, kites, and sparrows, are found about the dwellings of the Bengalese, enjoying the utmost freedom in security. A large species of stork is known as the "adjutant," from its military strut and erect attitude, which walks about at its ease and devours quantities of snakes, toads, and lizards. Among the feathered tribes, many of the birds are distinguished by splendid plumage.—The inland commerce of Bengal is chiefly carried on with Agra, Thibet, and Delhi. The principal articles of trade are silks, calicoes, muslins, saltpetre, opium, indigo, sugar, gum lac, and a variety of piece goods, nearly all of which now pass through the hands of the East India company. Grain from the corn countries, and salt from other districts, form the general articles of trade in the hands of the natives. Cotton is imported from the western provinces, and an exchange of tobacco and betel nut carried on. Part of this merchandise is transported by land carriage, but by far the greater part by water. The roads are generally in bad condition, and the noble causeways formerly constructed by the native princes have fallen into ruin. Such disadvantages are, however, amply compensated by the facilities of water communication, the numerous branches of the Ganges and Bramapootra being so completely diffused over a level country, that scarcely any village in the province is more than 20 miles remote from a navigable river. The wood, salt, and provisions of many millions of people,

are conveyed along these channels by 80,000 to 40,000 boatmen, who are the most laborious and hardy of the whole people of Hindostan.—Cotton piece goods form the chief manufacture of Bengal, but not nearly to the extent that formerly prevailed, as the use of such goods is almost entirely abandoned in British markets, and even with the natives the cheaper productions of Great Britain have superseded them in a great measure. In the eastern quarter of Bengal the district of Dacca has long been famous for its manufacture of plain muslins, known by various names, according to the fineness of the different qualities, as well as beautiful varieties of striped and flowered muslins. Coarse handkerchiefs and turbans are made in almost every province. A very extensive commerce prevails with Great Britain, in all the staple articles of cotton, silk, sugar, rum, and indigo. The imports are of wrought and unwrought metals, woollen and cotton goods, and, in short, almost every article of British manufacture. Rice is exported to Ceylon, cottons to Malabar, and silk to Surat; from which are usually brought in return considerable quantities of raw cotton to be employed in the manufactures of Bengal. Rice, cottons, and gum lac go to Bassorah, in exchange for dried fruits, gold, and rose-water, and a variety of rich merchandise is sent to Arabia, receiving in return chiefly gold and silver. But the maritime trade of Bengal has never been as extensive as the inland.—Prior to the British conquests, all the lands in Bengal, as in other parts of India, were farmed out by the nabob, on condition of a certain fixed sum being paid into his treasury, to rajahs and zemindars, who collected the rents from the immediate cultivators of the soil. The titles of the parties were not well defined, and under the evil system of the native rule, all justice was frequently lost sight of. When the British became conquerors, a question arose as to who were the real proprietors, the cultivators or the zemindars. It appears that as long as the tax, which was assessed at a certain rate, was regularly paid, the occupiers of the land were at least secured in the possession of their property, and disposed of or transmitted it to their descendants for generations. The government, however, looked to the zemindar for the immediate payment of the tax. In 1793, Lord Cornwallis introduced the permanent settlement, whereby the state bound itself not to increase the tax on the land at any future period. This measure, doubtless intended to protect all classes, the ryot or cultivator as well as the zemindar, has not done so, however, as the zemindar has been elevated from the rank of a revenue agent to that of a landlord, and the power in his hands of extorting almost any sum from the ryot that his avarice may dictate, has frequently led to frightful abuses and cruelties.—The following table, taken from Thornton's Gazetteer of India (Lond. 1857), will give the best idea of the size and population of the districts of the presidency in the lower provinces.

Districts.	Area in sq. miles.	Population.
Jessore.....	8,512.....	821,744

Total.....	203,946.....	40,871,091

The principal cities of Bengal and their population, are: Calcutta, 413,182; by the census of 1850; Moorshedabad, 150,000; Dacca, 60,000; and Burdwan, 54,000. From the great fertility of the soil and the slight vegetable diet required by the natives, it is calculated that Bengal might easily support double its present population. This now consists of about  $\frac{2}{3}$  of native Hindoos, and  $\frac{1}{3}$  of Moguls. The Moguls are the descendants of those who conquered the whole empire of Hindostan, more than 8 centuries ago, and who were originally natives of Tartary. In the eastern districts of Bengal they are very numerous; they are all Mohammedans, and hold the religious rites of the Hindoos in great abhorrence. As a people the Hindoos are slender, handsome, and well shaped, of a dark brown and sometimes a yellowish complexion, with black straight hair. Most of them shave their heads, and pluck out the hair from all parts of their bodies. Those

of the lower ranks go almost naked, wearing simply a cloth around the loins; those of higher order use turbans, and long dresses of white cotton. The female costume consists of loose drawers, a coat, and a mantle of cotton cloth worn over the shoulders. Their heads are uncovered, and their hair is worn fastened up behind with a profusion of ornaments, which they are fond of scattering over every part of their bodies. The character of the Bengalee cannot be rated high; the males are cunning, deceitful, and treacherous, and the women generally divide their time between their passion for dress, and their fondness for intrigue.—The English established their commercial intercourse with Bengal at a very early period, and made their first settlement on the Ganges in the beginning of the 17th century. This was at Hoogly, about 26 miles above Calcutta. By means of their fort and armed force, they protected their vessels which came down from Patna from the demands of the rajahs, and in the beginning of the 18th century they obtained from Ferokeera, the great grandson of Aurungzebe, a firman, exempting them from all duties, and this was regarded as the company's commercial charter. From the year 1742, they repelled frequent attacks from the Mahratta princes and the nabobs of Bengal, but the famous battle of Plassey, gained in 1757 by Lord Olive, with 3,200 men, only 900 of whom were Europeans, over the nabob's army of 50,000 foot and 18,000 horse with 50 pieces of cannon, laid the foundation of the British empire in India. In 1765 the English assumed the entire government of the province, receiving from the Mogul, Shah Aulem, a grant of the entire revenues of Bengal, Bahar, and Orissa, on condition of paying him 26 lacs of rupees, amounting to about \$1,800,000, per annum. The power of the company in Bengal, as in other parts of India, has been almost wholly gained by usurpation and violence, and there is much difference of opinion whether the condition of the natives has been improved under its rule. It has been contended with much force by able writers of England as well as other countries, that the people have been crushed and not elevated by their Anglo-Saxon masters. That there has long existed a great deal of ill-feeling which needed but some slight provocation to display itself, is proved by the extraordinary mutiny which began in 1857, among the native regiments of Bengal, and which will be fully treated under the title *HINDOSTAN*.

**BENGAL, BAY OF** (*Lat. Gangeticus Sinus*), a gulf of the Indian ocean, embraced between the peninsula of Hindostan on the W. and the coast of Lower Siam, Tenasserim, Pegu, and Aracan on the E. With the exception of the Arabian sea, it is the largest indentation on the southern coast of Asia, its width at the broadest part, *i. e.* from Cape Comorin at the S. extremity of Hindostan, to the same latitude on the coast of Siam, being 1,400 m. From this point it continues of nearly uniform width to

Cape Negrais, in lat. 16° 1' N., whence it contracts until the opposite coasts are but 250 m. apart, and terminates in an inlet or indentation of its N. shore, about 50 m. wide and thickly studded with islands. All that part of the bay lying south of the parallel of Cape Negrais is distinguished by some hydrographers as the sea of Bengal. It receives the waters of many important rivers, among which are the Ganges, Bramapootra, Hoogly, Irrawaddy, Godavery, and Kistnah. The tide in some places rises at times 70 or 80 feet. On the W. coast there are no good harbors, and no soundings at the distance of 30 m. from land, but on the E. side there are several safe ports, and soundings within 2 miles of the shore. The S. W. monsoon begins to blow on the W. or Coromandel coast about the end of March or early in April. In June it acquires its greatest strength and regularity; in September it subsides; and in October the N. E. monsoon commences, from which time till Dec. 1, navigation in the gulf is fraught with great danger. During the prevalence of both these winds a heavy surf rolls along the entire western coast, rendering access to the rivers extremely difficult.

**BENGALÉE, or GAURA LANGUAGE, THE**, is one of the 5 modern languages of Hindostan, which are derived from the ancient Sanscrit. Its name is derived from *Banga*, the Sanscrit name of the country, with the Arabic article *al* suffixed; the whole being corrupted into the present form. *Gaura* is derived from *Gaur*, the name of the ancient metropolis. It is spoken by 25 millions of British subjects, of whom about one-fourth speak also some other dialect. It extends over the regions on the lower Ganges, from Patna down to its delta; being purest in the province of Bengal, and in the eastern regions. One of its dialects, the *Mait'hila*, or *Thritiya*, is spoken in the Sircar Tirhut, as far northward as the Nepaulese Himalaya. The Bengalee name of the country is *Anggo*. This language consists of an aboriginal basis, with which a much greater portion of Sanscrit and Pracrit has been admixed than with that of any of its cognates; with a considerable addition of Afghan, Persian, Arabic, Portuguese, Malay, and English words. Although the Sanscrit element predominates, as regards the words, the grammatical forms of the language differ more from Sanscrit than the forms of the Greek, Latin, Gothic, and Persian; most of the flexions of nouns and verbs having been lost, and their places being supplied by auxiliary words, and by circumlocution. Notwithstanding this, it admits, in the higher style, many of those forms, which are intelligible only to more cultivated persons. There are no forms of gender, and only few feminine words are formed by the suffixes *i* and *ini*. There are 7 cases made by suffixes—nominative, accusative, instrumental, dative, ablative, genitive, and vocative. The plural of nouns is made by suffixing *dig* to the genitive singular. It delights in compound words, formed especially by means of

a sort of past participle; elegant Sanscrit compounds being unidiomatic. There is but one conjugation, whose radical is the imperative. Compound tenses are made by the auxiliaries, meaning *to do, to be, to become*. Only the 8 verbs meaning *to give, to come, and to go*, are irregular. The singular and plural of verbs are often confounded; the plural with a singular noun denoting respect, the singular with the plural noun being used in speaking to inferiors. There are 8 simple moods, infinitive, indicative, imperative; 4 others being periphrastic, the potential, optative, inchoative, and frequentative. Any verb is conjugable negatively by the suffix *nd*. The system of writing is that of the *devanāgarī* (divine city's writing) of the Sanscrit language, but the forms of letters are more broken and twisted. B and v, however, are written by one character, and the characters of the sounds, s, z, sh, are interchangeable.—No book written in Bengalee appeared before A. D. 1500. After the settlement of Moslems in Gaur, the Voisyas and Soodras (agricultural and servile castes) began to study Persian, to gain a livelihood, and were well rewarded by the conquerors. Historical works appeared about 380 years ago, written by the followers of Chaitanya, the founder of the Voishnava sect. Several religious essays were written soon after. A Bramin abridged the *Mahābhārata*; Kirtivasa translated the *Rāmāyana*. Both are ancient Sanscrit epic works. Except the stories of Krishna's study, the rules of arithmetic in verse, and a few other elementary books, the vernacular literature was very poor, until Rajah Krishna-chandra Roy Bahadoor restored Hindoo literature in India, by bringing in pundits and endowing schools. His endeavors bore ample fruit, and many Bramins now earn money by literary mendicacy, for the sake of supporting pupils. Owing to the abundance of Sanscrit books, and the prejudice of most Bramins against the Bengalee, this was neglected until 1800, when the college of Fort William was founded, and the study of Bengalee was made imperative and collateral to the Sanscrit, Dr. W. Carey being the first professor of both. Among others, the head pundit of the college, Mrity-unjoy Vidyalankar, was distinguished in promoting his native literature. Many Bengalee works have since been printed at Calcutta and Serampore. The first native newspaper was published by Mr. Marshman at Serampore, 1818. Considerable change has been made since in the diction and composition of this language, which continues to be enlarged and ennobled, by being capable of borrowing indefinitely from the venerable Sanscrit mother. Gilchrist, H. P. Forster, Carey, W. Morton, Hunter, Mohun Persaud, Tahur, Tarachand Chukruburti, Sir G. C. Haughton, have published Bengalee-English dictionaries and vocabularies, and Ram Comul Sen has translated Todd's edition of Johnson's English dictionary into Bengalee.

BENGALÉE YEAR, one of the solar years of India, apparently dating from the Hegira

(the Bengalee year 1264 commencing in April, 1857); but starting from the Mohammedan lunar year apparently about the middle of our 16th century. See CHRONOLOGY.

BENGAZI, a town of Tripoli, province of Barca; pop. 2,500. It is on the site of the ancient Berenice, and is a mean Arab town in a state of great filth and wretchedness. The remains of the ancient city lie all around a little below the surface. There was formerly a good harbor, but a reef of rocks at the entrance prevents its easy access, and the accumulations of sand deposit have nearly choked it up.

BENGEL, JOHANN ALBRECHT, a German Lutheran theologian of the 18th century, born at Winnenden, Würtemberg, June 24, 1687, died Dec. 2, 1752. He entered the theological college of Tübingen in 1703. He distinguished himself as a Greek scholar, and early exhibited a predilection for critical study. He began his career as a theological writer by a treatise on the holiness of God. He was the author of several very important works, but that on which his fame as a scholar principally depends is his edition of the Greek Testament, which was published in 1734. It produced a sensation in the theological world, and was one of the most valuable contributions to theological literature which the century afforded. No German theologian has infused more of his spirit and sentiments into English theology, if we except Luther, than Bengel. His edition of the Greek Testament, preceding those of Wetstein, Griesbach, Lachmann, and Scholz, was severely criticized by many eminent scholars, such as Michaelis, Baumgarten, and others. Bengel also wrote a work on the Apocalypse, in which production, one writer says, he exhibited an enthusiasm akin to the inspiration of the revelator himself. He considered the Apocalypse as the key to all prophecy, and believed that any right exposition of it would unseal the entire future history of the world up to the end of time. He thought he discovered in the mystical figures of the seer of Patmos that the world would end in 1836. He was occupied to the last in his critical studies, and died almost with his proof-sheets in his hands.

BENGER, ELIZABETH OGILVY, an English authoress, born in Wella, 1778, died Jan. 9, 1827. At the age of 18, the death of her father, a purser in the British navy, left her and her mother in very narrow circumstances. Six years later, she removed to London, where she became known to Campbell, the poet, Miss Joanna Baillie, Miss Aikin, Dr. Aikin, Dr. Gregory, Mrs. Elizabeth Hamilton and others. At the age of 13, she had shown her literary taste by writing a poem called "The Female Geniad," which was published. After her removal to London, she attempted prose fiction, poetry, and the drama, but without much success. It was as a biographer that she first obtained reputation. She produced in succession, memoirs of Mrs. E. Hamilton, of John Tobin, the dramatist, of Klopstock and his friends, of

Anna Boleyn, of Mary, queen of Scots, of Elizabeth, queen of Bohemia. When she died, she had made some progress in memoirs of Henry IV. of France. Miss Benger's style is clear, and her industry in collecting facts was undoubted. Her life was one long illness, and the very act of putting her thoughts upon paper was a painful task.

**BENGUELA**, a maritime country of western Africa, between lat. 9° and 16° S., and long. 12° and 17° E. The climate causes fever, the temperature varying from 94° to 105° F. in the shade. The surface is mountainous. The soil is well moistened and highly fertile. It produces fruits and European vegetables in abundance. The hills yield copper, sulphur, petroleum, and gold. Beasts of prey, including the lion and hyena, are numerous. The prevailing religion is fetichism. The government of the province is in the governor general of St. Paul de Loando. The Portuguese occupy some settlements in the province, beyond which their control does not actually extend. The chief of these is New Benguela, or St. Philip de Benguela, which is a seaport town, on the Atlantic, near the river Oatumbella, lat. 12° 38' 9" S., long. 18° 25' 2" E. It is the Portuguese capital of the district, and has a very commodious harbor. Its principal inhabitants are slave dealers. It has more ruined than inhabited houses, and has not a single place of instruction. Old Benguela, formerly the capital of the district, lies on the coast 182 miles N. N. E.

**BENI**, or **VENI**, a river of Bolivia, South America. It is formed by the junction of 2 small streams among the mountains lying S. E. of Lake Titicaca, thence it runs N. through the intendency of La Paz, curves to the N. E., and on reaching the confines of Brazil unites with the Mamore to form the Madeira. The surrounding country is level, very fertile, and inhabited by tribes of Indians, many of whom are in a barbarous state. Gold is found along its shores, and its waters afford fine fish.—A department of Bolivia, on the river Beni; its principal towns are Trinidad and Loreto. An English colonization company has received a grant of a large tract of land in this department.

**BENI-HASSAN**, a village of central Egypt, on the Nile. In its vicinity are a number of sculptured grottoes.

**BENI-ISGUEN**, a town of Algeria, in the Sahara desert. It is strongly built, surrounded by a wall with 5 towers.

**BENI-SOEF**, or **BENI-SOUFF**, a town of Egypt, on the Nile. It has large cavalry barracks, cotton mills, and alabaster quarries, and is the entrepot for the produce of the rich valley of Fayoom. Pop. 5,000.

**BENICIA**, the former capital of California, shire town of Solano county; pop. in 1854, about 2,000. It is on the strait of Karquenas, which connects San Pablo and Suisun bays. The land, for about a mile from the town, is level or gently undulating. Beyond this tract are hills, and still further back a succession of hills and

valleys. The valleys are capable of cultivation, but in and around the town there is not even a tree to be seen. The houses are of wood, and present a neat and respectable appearance. While the legislature held its sessions here, there were several large hotels; commerce flourished, and building was carried on with great rapidity. The capitol is a handsome brick edifice, on the brow of a slope about half a mile from the river. The facings are of stone, brought from an inexhaustible quarry a short distance below the town. This stone is of a light brownish color, soft, easily wrought, and hardening with age or exposure. The harbor is capable of accommodating ships of the largest size. The works of the Pacific mail steamship company, with founderies and machine shops, a navy station, and an arsenal, are in the town or its environs. Several steamboat lines, running between San Francisco and Sacramento, touch at Benicia.

**BENIN**, a kingdom of western Africa, in upper Guinea, bordered by the bight of Benin. Its extent is not known. Its coast is thickly indented with estuaries of considerable expanse, and studded with isles. The surface is level for a certain distance inland. Further in it rises to an elevation of 2,000 and 3,000 feet. It is thickly wooded. The soil is profuse in all the vegetable growths of the tropics. It is laid out in square plots, which produce gums, plantains, maize, and sugar-cane of excellent quality. Cotton is indigenous. The government is native, and the most revolting cruelty is characteristic of it and the people. Their religion is fetichism. Human sacrifices are numerous. The country is the seat of an extensive traffic in slaves, and of a limited trade in salt, palm oil, and blue coral.—Its capital is Benin, a large town, pop. 15,000, on the right bank of Benin river, one of the mouths of the Niger. Benin was formerly the great emporium for slaves. The palace of the king outside of the city is defended by walls. The houses of the city are built of clay, thatched with reeds, straw, or leaves. They are irregularly distributed. The city is a busy mart for cattle, sheep, goats, pigs, poultry, yams, cotton, ivory, European wares, and fruits. Belzoni, the celebrated traveller, died near this place in 1828.—**BENIN RIVER**, in the kingdom of Benin, upper Guinea, one of the mouths of the Niger. It discharges into the gulf of Guinea, 180 miles below Benin, and 120 N. N. W. of Cape Formosa. Lat. (entrance N. W. point), 5° 46' N., long. 5° 4' E. It is 2 miles wide at its mouth, across which is a bar, with 12 feet of water at spring tides. It divides into 2 branches, which have been explored to the distance of 50 and 70 miles respectively, the dense vegetation prevented further progress.—**BIGHT OF BENIN**, the northern portion of the gulf of Guinea, between the Slave coast and Calabar river. Many rivers empty into it, but the natural facilities for commerce are very limited.

**BENIOWSKY**, MORITZ AUGUST VON, an ad-

venturous Hungarian, born at the village of Verbova, Hungary, in 1741, died May 28, 1786. The son of an Austrian general, he served as lieutenant in the 7 years' war, and in the Polish war against Russia. In 1769 he fell into the hands of the Russians, who exiled him to Kamtchatka. Availing himself of a knowledge of navigation which he had acquired, he succeeded in saving the vessel which was to convey him to Siberia from wreck. This feat won for him the sympathy of the governor of Kamtchatka, which was still more strengthened by his proficiency in chess, and he appointed him tutor of his children. Among these children was a lovely girl of the name of Aphanasia, who fell in love with the romantic Hungarian, and with the consent of her father they were married. In 1771 he effected his escape from Kamtchatka with the assistance of his wife, who, although she had since learned that he had another wife in Hungary, continued to cling to him with the same affection, followed him to Formosa and to Moscow, at which latter place she died, loving him to the last. On his return to Paris, he undertook to found a French colony at Madagascar, where he arrived in June, 1774, founded his colony, and in 1775 was proclaimed king by some of the native tribes, while his wife, whom he had this time prudently taken with him, was proclaimed queen. The governor of the Isle of France refusing to supply him with men to support his state, Beniowsky applied directly to the French government, but without success. Disgusted with the French and their colonies, he now entered the Austrian service, and was commander in the battle of Habelschwerdt, in 1778, against the Prussians. His subsequent efforts to interest the English government for Madagascar were fruitless, but he was successful in obtaining the support of a wealthy firm of Baltimore, U. S., and leaving his wife in America, he effected a landing in that island, but soon after he arrived he was killed in a conflict with a body of troops from the Isle of France. He wrote his autobiography in French; it was translated into German by George Forster, into English by William Nicolson, and into various other languages. Kotzebue dramatized his character and career in his play entitled the "Conspiracy in Kamtchatka."

**BENJAMIN** (son of my good fortune), named by his mother, who died in childbirth, Benoni (son of my sorrow), the youngest and favorite son of Jacob. We find Jacob refusing at first to let Benjamin go down into Egypt with the other brethren, at the demand of the then unknown Joseph, during the famine. The tribe of Benjamin was weak and small in its early history, yet it seems to have been treated with special favor in the exodus of the Hebrews to Palestine, having the place of honor both in the encampment and order of march. On the division of the land, a territory rich and fertile, though small, was assigned to Benjamin. It was a sort of frontier land between the two great rival tribes of Ephraim and Judah, and it

seems to have vacillated, in its attachments, from one to the other. In its early history it attached itself to Ephraim, and is generally mentioned in connection with that tribe. It furnished the first king to Israel, in the person of Saul. Upon the death of Saul the tribe of Benjamin, naturally enough, claimed the succession in the person of Ishbosheth. Around him the 11 tribes rallied, while David, of the tribe of Judah, set up a claim to the throne. His most violent enemies, from the commencement of his campaign against the kingdom, Saul, Shimei, and Sheba, were Benjamites. Jerusalem, within the borders of Benjamin, was already in his possession, while Bethel and Jericho were in the hands of the northern factions. Under these circumstances Benjamin scarcely knew how to act. The death of Abner and Ishbosheth decided its course. Policy was on the side of a surrender, which was felt by all the rebellious tribes, and accordingly David was recrowned at Hebron, as the king of all Israel. From that time the fortunes of Benjamin no longer follow those of Ephraim on the north, but are cemented to the more princely estate of Judah on the south. To Judah Benjamin was more closely geographically related than to Ephraim. In the northernmost part of the Benjamite territory coursed across from east to west that great range of highlands, on which stood Ai, Michmash, and Bethhoron, overlooking on the one hand the vast southern slope of Jerusalem and the surrounding country of Judea, and on the other the more extensive but less fertile territory of Samaria and Galilee. On this tableland was the second great struggle of the Israelites for an entrance and possession of the promised land. Here was the conflict of Saul with the Philistines in the hour of the deepest depression the Jewish state ever saw until her subjugation to the Assyrian power. And from these high tablelands the crusader Cœur de Lion exclaimed, with his face buried in his armor, that he might not see the country that lay stretched out before him, and desecrated by the Moslem sway: "Ah, Lord God! I pray that I may never see thy holy city, if so be that I may not rescue it from the hands of thine enemies." The interests of Benjamin were, then, geographically involved in the triumph of the house of David when the immediate prospect of its own supremacy was taken away in the death of Ishbosheth. To its topographical destinies it was always after faithful, not even losing its affection for Judah in the revolt of the ten tribes under Jeroboam, nor yet in the captivity of Babylon, for after the return Judah and Benjamin were "the flower of the new Jewish colony in Palestine."

**BENJAMIN, PARK**, an American poet and journalist, born Aug. 14, 1809, at Demerara, in British Guiana, where his father, a New Englander of Welsh descent, resided as a merchant. An illness at an early age, improperly treated, caused him a permanent lameness, and he was sent to his father's home in New England for

medical advice and to be educated. He studied 2 years at Harvard college, graduated at Trinity college, Hartford, in 1839, began to practise law in Boston in 1839, and was one of the original editors of the "New England Magazine." In 1837 he removed to New York, edited in connection with O. F. Hoffman the "American Monthly Magazine," and subsequently was associated with Horace Greeley in editing the "New Yorker." He was next engaged, in connection with Epes Sargent and Rufus W. Griswold, as editor of the "New World," a cheap weekly periodical, which republished the best articles of English magazine literature, and received original contributions from many spirited writers. After 5 years he sold his interest in this journal, and has since appeared frequently before the public as a lecturer both in prose and verse. His poems, which embrace many popular lyrical and satirical pieces, have never been collected, but are found scattered through the recent periodical literature of the country.

**BENJAMIN OF TUDELA**, a Jewish rabbi, born at Tudela, in Navarre, died about 1178, noted in history as the first western traveller who penetrated very far into the regions of the East. He journeyed, as appears from his "Itinerary," as far as China, though most critics incline to the opinion that very many of his descriptions of places are derived from other sources than personal travel and observation. His account is full of fabulous stories and errors in fact. The spirit of critical examination and geographical research which has characterized eastern travel, and especially in the Holy Land, for 2 centuries past, was not then kindled. The important aid of correct geographical knowledge in scriptural expositions had not been recognized. The Bible was not studied as it is now. Moreover, Benjamin was a Jew; he travelled and wrote with Jewish prejudices. Indeed, the specific object of his journey was to acquaint himself with the state of his brethren in the East. No wonder, then, that he dilates with more enthusiasm on the prospects of the Jewish people when he stumbles upon a petty "prince of the captivity" exercising a limited authority at Bagdad over the Jews of the surrounding country, while he utterly neglects to describe some of the important scriptural places which he seems to have visited in Palestine, descriptions which, if faithfully made at that early day (1160), would have afforded valuable contributions to biblical literature. The "Itinerary," an account of his tour, was first written in Hebrew. It has since been published in German, Latin, French, and English. The first Hebrew edition was published in 1548, at Constantinople.

**BENKAH**, a fortified village of Bootan, N. India. It is built on a nearly inaccessible rock, 8,100 feet above the sea, has a citadel, and is defended by several round towers.

**BENKEN**, a small village of Switzerland, in the canton of Zurich, situated on the side of a hill clad with vines. It is noted for 2 battles

fought between the Austrians and Russians and the French in 1799. Pop. 625.

**BENKENDORFF**, **ALEXANDER**, count, a Russian diplomatist, born in 1782, in Esthonia, of a family of the inferior gentry, died at Baden-Baden, Sept. 28, 1842. His mother was first lady of the bed-chamber to the princess Mary of Württemberg, wife of the unhappy Paul I. of Russia. She followed her mistress to St. Petersburg, and married there. Her son thus obtained a position early in life at the court of Paul, whom he pleased by his quiet, insinuating manners and talent for drawing. He was placed in the guards, and advanced rapidly. After the death of Paul, he was transferred to the general staff, and participated in the wars against Napoleon in Germany and France. After the return of peace, he commanded a regiment of the guards, was again admitted into daily intimacy with the empress mother, the widow of Paul, and thus became intimate with Nicholas, then grand duke, who liked his apparent good-natured straightforwardness and high-sounding, virtuous phraseology. Nicholas, on becoming emperor, believed he had in Benkendorff the man to carry through reforms and eradicate all the internal abuses of the administration. Benkendorff was made a member of the military board appointed to investigate the conspiracy of 1835. He gained the fullest confidence and affection of his master, and became an all-powerful favorite. He introduced and enlarged the net of the *gendarmes* or military police over the whole empire, rendering it superior to all the military, civil, and ecclesiastical authorities. He was the chief of this peculiar army, numbering 44,000 men, as well as of the secret police or the secret spy system, of which the *gendarmes* formed the visible centres and channels of communication. Everybody trembled before a man who daily reported to his master so many secrets, mysteries, lies, and scandals. In the course of his career he was created a count. He was good-natured, but narrow-minded and feeble, mentally indolent, and himself a tool in the hands of his subordinates. The emperor Nicholas generally yielded to his advice, which, if not always clear and intelligent, was conciliatory as far as Benkendorff's mental powers could embrace the difficult questions affecting prominent individuals throughout the empire, in regard to whom he was called upon to enlighten his master. At one time even the highest matters of state and of foreign policy passed through his hands. His habits were dissolute, and he died discredibly.

**BENNET**, **HENRY**, earl of Arlington, an English statesman, born at Arlington, in Middlesex, England, in 1618, died July 28, 1685. He devoted himself to the cause of Charles I., and was appointed under-secretary of state; he fought in several battles, and was wounded at Andover. After the battle of Worcester he retired to Spain. Upon the restoration he returned to England, and was rewarded for his

services by being appointed keeper of the privy seal, and shortly afterward secretary of state. In 1664 he was created Baron Arlington; in 1670 became noted as one of the famous cabal, but is not accused of entertaining their extreme sentiments; he was created earl of Arlington in 1672. He was one of the plenipotentiaries sent to Utrecht to negotiate a peace between Austria and France. This mission not being successful, an endeavor was made by his colleagues to cast the odium of the failure upon Arlington; he, however, defended himself before the house of commons, and was acquitted. The war with Holland, which is said to have been caused by the machinations of the cabal, lost to Arlington the favor of the king and people; he, however, received the office of chamberlain. In 1679 he became a member of the new council, and retained his office of chamberlain on the accession of James II. During the many years in which he resided on the continent he had learned a cosmopolitan indifference to constitutions and religions; and while, if there was any form of government which he liked, it was that of France, and if there was any church for which he felt a preference, it was that of Rome, he yet observed the outward ordinances of Protestantism, and accommodated himself to the political views of the king and the public.

BENNET, THOMAS, an Anglican theologian and controversialist, writing equally against the Catholics and the various bodies of dissenters, born at Salisbury, May 7, 1678, died Oct. 9, 1728. He was extensively acquainted with the Greek, Latin, and oriental literatures, and composed verses in the Hebrew language. In 1700 he became rector of St. James's, Colchester, which position he held until 1714, when he became D.D., and removed to London, where he was chosen morning preacher at St. Lawrence Jewry, and lecturer at St. Olave's, in the Borough. He was soon after presented to the vicarage of St. Giles's, Cripplegate. Beside his works in confutation of popery, schism, Quakerism, and the principles of the nonjurors, he wrote many tracts on baptism, liturgies, and clerical rights, and engaged in the Trinitarian controversy in an examination of the "Scripture Doctrine of the Trinity" by Dr. Clark. Bennet was violent in his disputes, but honest and orthodox in his views.

BENNET, WILLIAM, an English composer, born about 1767, studied music at Exeter, under Bond and Jackson, and at London, under Bach and Schröter. By the last he was instructed in playing upon the piano-forte, which he was the first to introduce into Plymouth. In 1798 he was made organist to the church of St. Andrew's at Plymouth, and gained much reputation as an improvisator upon the organ. Of his numerous compositions the best are his collects of the church of England, new version of psalms, an anthem for the coronation of George IV., and an American glee.

BENNETT, JAMES GORDON, an American journalist, founder and proprietor of the "New York Herald," born about the year 1800, at New Mill, Keith, in Banffshire, Scotland. He remained at school in his native place till he was 14 or 15 years of age, when he went to a Roman Catholic seminary in Aberdeen, with a view to preparing for holy orders in that church, of which his parents were members. At this institution he pursued the usual routine of academic life for 2 or 3 years, when he abandoned the intention of entering upon an ecclesiastical career, and soon after determined to emigrate to this country. Acting under a sudden impulse, he embarked with a youthful companion, in April, 1819, and arriving in Halifax, with but scanty pecuniary resources, betook himself to the occupation of teaching for the sake of a livelihood. He was led to this employment by necessity rather than inclination, and after a brief experience of its annoyances, left Halifax for Portland, and soon made his way to Boston. This was in the autumn of 1819, and making the acquaintance of Mr. William Wells, an English gentleman, at the head of the distinguished publishing house of Wells and Lilly, he obtained the situation of a proof reader in that establishment. During his residence in Boston he was the author of several poetical compositions, suggested by his rambles in the vicinity of that metropolis. Little else is known of his history at this period. In 1822 he came for the first time to New York, and after a short connection with the press, accepted the offer of Mr. Willington, the proprietor of the "Charleston Courier" to employ him as a translator from the Spanish-American papers, for that journal. He also prepared original articles for the "Courier," some of which were in verse. He remained in this situation for several months, when he returned to New York, and issued proposals for the establishment of a commercial school. This plan was not carried into effect, and his next step was the delivery of a course of lectures on political economy, in the vestry of the old Dutch church in Ann street. In 1825 Mr. Bennett made his first attempt to become the proprietor of a public journal. He purchased a Sunday newspaper called the "New York Courier;" but not succeeding in the enterprise, was employed as a writer and reporter for several journals of the city. In 1826 he became closely connected with the "National Advocate," a democratic newspaper published by Mr. Snowden; and after the state election of that year, began to take an active part in politics. He was a vehement opposer of the tariff, and commented severely on the subject of banks and banking. In the spring of 1827 he discontinued his connection with the "National Advocate," which, having changed proprietors, had espoused the cause of John Quincy Adams, while Mr. Bennett was a warm partisan of Martin Van Buren, then in the senate of the United States. He was next engaged with the late M. M. Noah, as associate editor of the

"*Enquirer*," and became an acknowledged member of the Tammany society. During the presidential canvass of 1828, he was devoted to the interests of Gen. Jackson, residing at Washington as correspondent of the "*Enquirer*." After the fusion of that journal with the "*Courier*," in 1829, he continued to write in the editorial department of the "*Courier and Enquirer*;" and in the autumn of the same year, he became an associate editor. In 1831 he commenced a series of articles on the banking system of the United States, sustaining the opposition of Gen. Jackson and the democratic party, to the recharter of the United States bank. He remained in this position until 1832, when a difference of political opinion with the senior editor, Col. J. W. Webb, led to his retirement, and in Oct. of the same year he issued the first number of a new journal called the "*New York Globe*." This continued precisely one month, during which time it was strenuously devoted to the cause of Jackson and Van Buren. Mr. Bennett then purchased a part of the "*Pennsylvanian*," a daily journal in Philadelphia, and became its principal editor. He continued this publication until 1834, when he returned to New York, and in May, 1835, issued the first number of the "*New York Herald*," with which journal his name has since that time been identified. (See "*Memoirs of James Gordon Bennett, and his Times*," by a journalist, New York, 1855.)

BENNETT, WILLIAM STERNDALE, an English composer, born at Sheffield, England, April 18, 1816. At 8 years of age he was entered as a chorister in King's college, Cambridge, whence he was transferred to the royal academy of music, and became a pupil of Dr. Crotch, under whose tuition he composed a symphony in E flat, and several concertos, which were performed at the philharmonic concerts in London. He had completed several brilliant compositions, when attending the musical festival at Düsseldorf, he made the acquaintance of Mendelssohn, and formed an intimacy with him which had an important effect upon the career of the young composer, who thenceforth modelled his style upon that of his friend, at whose invitation he went to Leipzig, and brought out his overture of the "*Naiades*," and other works, at the Gewandhaus concerts. The favor with which these were received induced him to make Germany his home for several years. On his return to England in 1838, he was made a member of the royal society of music. He delivered at Queen's college, London, in 1843, a lecture on harmony, and has composed for his pupils a collection of pieces for practice on the piano-forte. His music so strongly reflects the peculiarities of Mendelssohn, that it cannot be called original, though full of grace and imagination.

BENNINGSSEN, LEVIN AUGUST THEOPHILE, count, a Russian general, born in Brunswick, Feb. 10, 1745, where his father served as colonel in the guards, died Oct. 8, 1826. As a

page, he spent 5 years at the Hanoverian court of George II.; entered the Hanoverian army, and having advanced to the rank of captain in the foot guards, participated in the last campaign of the 7 years' war. His excessive passion for the fair sex at that time made more noise than his warlike exploits. In order to marry the daughter of the baron of Steinberg, the Hanoverian minister at the court of Vienna, he left the army, retired to his Hanoverian estate of Banteln, by dint of lavish expenditure got hopelessly in debt, and, on the death of his wife, resolved to restore his fortune by entering the Russian military service. Made a lieutenant-colonel by Catharine II., he served first under Romanzoff, against the Turks, and then under Suwaroff, against the rebel Pugatcheff. During a furlough granted to him he went to Hanover to carry off Mlle. von Schwiebelt, a lady renowned for her beauty. On his return to Russia, the protection of Romanzoff and Potemkin procured for him the command of a regiment. Having distinguished himself at the siege of Otchakov, in 1788, he was appointed brigadier-general. In the Polish campaign of 1793-'94, he commanded a corps of light troops; was created general after the affairs of Orshani and Solli; decided the victory of Vilna, by breaking up, at the head of the horse, the centre of the Polish army, and, in consequence of some bold surprises, successfully executed on the banks of the lower Niemen, was rewarded by Catharine II. with the order of St. Vladimir, a sabre of honor, and 200 serfs. During his Polish campaign he exhibited the qualities of a good cavalry officer—fire, audacity, and quickness—but not the higher attainments indispensable for the chief of an army. After the Polish campaign, he was despatched to the army in Persia, where, by means of a bombardment, lasting 10 days, he compelled Derbend, on the Caspian sea, to surrender. The cross of the order of St. George of the second class, was the last gift he received from Catharine II., after whose death he was recalled and disgraced by her successor. Count Pahlen, military governor of St. Petersburg, was organizing at that time the conspiracy by which Paul lost his life. Pahlen, knowing the reckless character of Benningsen, let him into the secret, and gave him the post of honor—that of leading the conspirators in the emperor's bedchamber. It was Benningsen who dragged Paul from the chimney, where he had secreted himself; and when the other conspirators hesitated, on Paul's refusal to abdicate, Benningsen exclaimed, "Enough talk," untied his own sash, rushed on Paul, and after a struggle, in which he was aided by the others, succeeded in strangling the victim. To shorten the process, Benningsen struck him on the head with a heavy silver snuff box. Immediately on the accession of Alexander I., Benningsen received a military command in Lithuania. At the commencement of the campaign of 1806-'7, he commanded a corps in the first army under Kameuski—the second being com-

manded by Buxhövdén—he tried in vain to cover Warsaw against the French, was forced to retreat to Pultusk on the Narev, and there, Dec. 24, 1806, proved able to repulse an attack of Lannes and Bernadotte, his forces being greatly superior, since Napoleon, with his main force, had marched upon the second Russian army. Benningsen forwarded vain-glorious reports to the emperor Alexander, and, by dint of intrigues against Kamenski and Buxhövdén, soon gained the supreme command of the army destined to operate against Napoleon. At the end of January, 1807, he made an offensive movement against Napoleon's winter quarters, and escaped by mere chance the snare Napoleon had laid for him, and then fought the battle of Eylau. Eylau having fallen on the 7th, the main battle, which, in order to break Napoleon's violent pursuit, Benningsen was forced to accept, occurred on Feb. 8. The tenacity of the Russian troops, the arrival of the Prussians under Lestocq, and the slowness with which the single French corps appeared on the scene of action, made the victory doubtful. Both parties claimed it, and at any rate, the field of Eylau—as Napoleon himself said—was the bloodiest among all his battles. Benningsen had *Te Deums* sung, and received from the czar a Russian order, a pension of 12,000 rubles, and a letter of congratulation, praising him as “the vanquisher of the never vanquished captain.” In the spring, he intrenched himself at Heilsberg, and neglected to attack Napoleon, while part of the French army was still occupied with the siege of Dantzic; but, after the fall of Dantzic, and the junction of the French army, thought the time for attack had arrived. First delayed by Napoleon's vanguard, which mustered the third part only of his own numerical force, he was soon manoeuvred back by Napoleon into his intrenched camp. There Napoleon attacked him in vain June 10, with but two corps and some battalions of the guard, but on the next day induced him to abandon his camp and beat a retreat. Suddenly, however, and without waiting for a corps of 28,000 men, which had already reached Tilsit, he returned to the offensive, occupied Friedland, and there drew up his army, with the river Alle in his rear, and the bridge of Friedland as his only line of retreat. Instead of quickly advancing, before Napoleon was able to concentrate his troops, he allowed himself to be amused for 5 or 6 hours by Lannes and Mortier, until, toward 5 o'clock, Napoleon had his forces ready, and then commanded the attack. The Russians were thrown on the river, Friedland was taken, and the bridge destroyed by the Russians themselves, although their whole right wing stood still on the opposite side. Thus the battle of Friedland, June 14, costing the Russian army above 20,000 men, was lost. It was said that Benningsen was at that time influenced by his wife, a Polish woman. During this whole campaign Benningsen committed fault upon fault, his whole conduct exhibiting

a strange compound of rash imprudence and weak irresolution. During the campaign of 1812, his principal activity was displayed at the head-quarters of the emperor Alexander, where he intrigued against Barclay de Tolly, with a view to get his place. In the campaign of 1818, he commanded a Russian army of reserve, and was created count by Alexander, on the battle field of Leipsic. Receiving afterward the order to dislodge Davoust from Hamburg, he beleaguered it until Napoleon's abdication of April, 1814, put an end to hostilities. For the peaceful occupation of Hamburg, then effected by him, he claimed and received new honors and emoluments. After having held the command of the army of the south, in Bessarabia, from 1814 to 1818, he finally retired to his Hanoverian estate, where he died, having squandered most of his fortune, and leaving his children poor in the Russian service.

BENNINGTON, the name of a county and its shire town in Vermont, area about 700 sq. miles, pop. in 1850, 18,589. It lies in the S. W. corner of the state, and is skirted by the Green mountains on the east. It is well watered by the Battenkill, Hoosick, and smaller streams, has many water privileges, and although much of its land is too rough for cultivation, it is good for grazing, and is, on the whole, a thriving part of the state. In the north part of the county, especially in Dorset, large quantities of marble are quarried and manufactured, for building and ornamental purposes, some varieties of which are very white and fine, and take a high polish. The county is cut by 2 railroads, meeting at Rutland, Vt., on the north, and at Eagle Bridge, N. Y., on the south. The Rutland and Washington road crosses the north-western corner of the county only, while the western Vermont nearly bisects it, having stations in 6 towns. In 1850 the productions amounted to 150,920 bushels of Indian corn, 200,018 of potatoes, 54,600 tons of hay, 502,786 pounds of butter, and 558,494 of cheese. There were 8 cotton and 4 woollen factories, 8 grist mills, 2 paper mills, 2 powder mills, 40 saw mills, 4 founderies, 2 newspaper offices, 29 churches, and 6,177 pupils attending public schools.—The town is situated in the S. W. part of the county, was settled in 1761, has a considerable manufacturing interest, especially of stoneware, known as the Bennington ware, and is one of the shire towns of the county, Manchester being the other. Bennington is noted in history as the place in which one of the early battles of the revolution was fought. The army of Gen. Burgoyne, marching to the south from Canada in 1777, and causing the abandonment of Ticonderoga by Gen. St. Clair, created the greatest commotion throughout New England, since Boston was supposed to be its point of destination. Gen. Stark chanced to be at the time at Bennington, having under his command a corps of New Hampshire militia, and he determined to confront a strong detachment of

the enemy sent out under Col. Baum to procure supplies. He hastily collected the continental forces in the neighborhood, and Aug. 16 approached the British colonel, whom, after a hot action of 2 hours, he forced to a disorderly retreat. The engagement was hardly over when a reinforcement arrived, sent by Gen. Burgoyne, and the battle was renewed, and kept up several hours till dark, when the British forces retreated, leaving their baggage and ammunition. The loss of the enemy was 200 killed, 600 taken prisoners, and 1,000 stand of arms.—The Americans lost only 14 killed and 42 wounded. No trace now remains to indicate the precise locality of the engagement.

**BENNO**, *Saxr*, bishop of Meissen, born in 1010 at Hildesheim, died June 16, 1107. He was educated in the cloister of St. Michael in his native town, where in 1039 he assumed the cloak of a Benedictine monk. In 1051 he received the appointment of canon of the church in Goslar, and in 1066 was promoted by the emperor Henry IV. to the bishopric of Meissen. The efforts which he immediately began for the advancement of Christianity in the territories of his bishopric were frustrated by the war which broke out between the emperor and Pope Gregory VII. He declared himself for the pope against the cause of Henry, and though more than once made a prisoner by the imperial forces, was yet restored to freedom. But when in 1085 he supported in a general council the ban of excommunication which was thundered against the emperor, the latter exerted his power and took from him his bishopric. He was afterward restored to the same bishopric by Pope Clement III., and, in an unenlightened age and a most benighted territory, labored with zeal and discretion until his death for the welfare of his flock. In the 15th century pilgrimages were made to his tomb, and in 1523 he was canonized.

**BENOÎT**, *Renf*, a celebrated French doctor of the Sorbonne, curate of St. Eustace, in Paris, was born at Savenières, near Angers, in 1521, and died March 7, 1608. Being secretly inclined to Protestantism, he published at Paris the French translation of the Bible which had been made by the reformed ministers at Geneva, which, although it had been approved by several doctors of the Sorbonne, and its publication authorized by Charles IX., was condemned as soon as it appeared. Benoît was confessor to Mary, queen of Scots, during her stay in France, and for some time after her return. When Henry IV. abjured the reformed faith, he assisted at the ceremony. He was afterward made bishop of Troyes, but could never obtain the pope's authority for his installation, and was obliged to content himself with enjoying the episcopal revenues.

**BENOOWE**, "the mother of waters," a river of central Africa, the main tributary of the Quorra, Kawara, or Niger, which it rivals, if it does not surpass, in length, depth, and breadth. This river has hitherto been termed

the Chadda, Tchadda, or Tsadda, but Dr. Barth thinks this name was an invention of Lander, who, in common with other travellers, erroneously fancied it to be an outlet of Lake Tchad. It was first discovered by Richard and John Lander, Oct. 25, 1830. On Aug. 2, 1834, Richard Lander, Lieut. Allen, and Dr. Oldfield, entered the Benooowe, which they call the Chadda, in the ship *Alburkah*, intending to ascend it as far as its supposed source, Lake Tchad, but after proceeding 104 miles, and reaching a country called Domah, the king of which was at war with the sheik of Bornoo, they ran out of provisions and were obliged to return. The people would neither trade nor sell them any thing, but deserted the villages and retreated into the woods at their approach. On June 12, 1851, Dr. Barth, while travelling in Adamawa, came upon this river at its point of junction with a considerable affluent, the Faro, about long. 12° 30' E. It was there at least 800 feet broad, and was liable to rise, under ordinary circumstances, 30 or even 50 feet higher. The natives informed the traveller that it came from the S. S. E. Nothing further is as yet known of its source and upper course. The British government, impelled by the desire to open up to civilization and commerce the districts lying on the banks of this great natural highway into the centre of the continent, despatched (in conjunction with Mr. Macgregor Laird, a gentleman of wealth and knowledge) the steamer *Pleiad* to navigate this stream. Dr. Baikie eventually took command of the expedition, and has published an interesting narrative of his journey. See "Narrative of Exploring Voyage up the Niger and Tsadda, 1854" (Lond. 1856). The *Pleiad*, with an entire crew of black sailors and 8 black interpreters, commenced the exploration, July 8, 1854. The expedition reached a point 300 miles higher up the Benooowe than Allen and Oldfield, in 1834, and only 60 miles below the place of junction with the Faro. The want of wood for the purposes of fuel, and the fear of the crew that the river would fall and prevent them from regaining the coast, compelled a return. There was not a single death during this expedition. The inhabitants along the banks are partly pagans, and partly Mohammedans. The last are of the Fellatah nation, and speak the Palo and Housa tongues. The banks beyond Domah are thus described by Dr. Baikie: "Though no towns or villages could be seen to enliven the prospect, yet every thing around us wore a smiling aspect. The river, still upward of a mile in breadth, preserved its noble appearance; the neighboring soil teemed with a diversified vegetation, and the frequent recurrence of hill and dale pleased the eye. Nor was animal life wanting, for from our mast-head we enjoyed the novel sight of a large herd of elephants, crossing a little streamlet not much more than a mile from us." The further inland the *Pleiad* got, the more savage the population became. They discovered a tribe who lived in houses and villages flooded with water,

"like a colony of beavers, or after the fashion of the hippopotami and crocodiles of the neighboring swamps."

**BENOWM**, a town of Soodan, near the Senegambian frontier, in lat. 15° 5' N., long. 9° W. It is a caravan station on the road from the Senegal to Timbuctoo.

**BENSLEY, THOMAS**, a distinguished printer of London, died in 1838. He is much known for an edition of Lavater, printed by him in 1789, in 5 vols. 4to, and for an edition of the English Bible between 1800 and 1815, in 7 vols. 4to. He also printed Shakespeare in 1803, in 7 vols. 8vo, and Hume's England in 10 vols. folio, in 1806, which is adorned with elaborate portraits and engravings on copper. He was prominent also in the construction of the machine printing press, invented by Koenig, and applied to printing the "Times" newspaper in 1814.

**BENSON, GEORGE**, an English dissenting clergyman, born in Great Salkeld, in 1699; died in 1768. At 11 years of age he read the Greek Testament. From 1721 to 1763 he held successive pastoral charges; first at Abingdon, Berkshire, next at Southwark, and finally as colleague of Dr. Lardner in the congregation of Orclutched Friars. He published several works, among which may be mentioned "A Treatise on Prayer" (1781), "Comments on some of the Epistles," "History of the first Planting of Christianity" (1785), "Reasonableness of the Christian Religion," "History of the Life of Christ," and "An Account of the Burning of Servetus, and of the concern of Calvin in it." In his early ministerial career he was Calvinistic in theology; later he became an Arian, and endeavored to suppress some of his former publications.

**BENSON, JOSEPH**, a Wesleyan Methodist minister, born Jan. 26, 1748, in the parish of Kirk-Oswald, in Cumberland, England, died Feb. 16, 1821. He acquired the rudiments of learning in the village school, and was subsequently placed under the care of the Rev. Mr. Dean, a minister of the Presbyterian church. He was a diligent student, and made rapid progress in the study of the Latin and Greek languages. His father designed educating him for a minister in the established church, but, while pursuing his studies, he was, through a relative, introduced to the Methodists, and, under the labors of that denomination, was converted. Soon after this event he joined that society, and ever afterward remained one of its most zealous and devoted members. After finishing the course of study at Mr. Dean's school, at the age of 17 he became a teacher in the Gamblesby school in Cumberland. Subsequently meeting with Mr. Wesley at Bristol, he was appointed by him to the office of classical teacher in the Kingswood school. His first attempts at preaching were among the colliers of Kingswood. Soon after he entered upon his duties as teacher at this place he entered his name in the books of the university of Oxford, and regularly kept his terms at St. Edmund's hall.

His object in this was to make himself more fully acquainted with classical literature, mathematics, metaphysics, and natural philosophy.—In the year 1767 the countess of Huntington founded a college at Invecca for the education of candidates for the Christian ministry, under the superintendence of Mr. Fletcher, through whose influence, and the sanction of Mr. Wesley, Mr. Benson was appointed the principal. After remaining some time in this institution, he went to Oxford, with the intention of preparing himself for orders in the church of England. In this, however, he was disappointed, for notwithstanding he had passed the curriculum of the university, his views and feelings were too strongly tintured with Methodism to allow his instructors to sign his testimonials, and though he obtained, through a clerical friend, a populous parish with a large church, and his testimonials were countersigned by the bishop of St. David's, yet the bishop in whose diocese the parish was situated refused to ordain him. He then returned to his Methodist friends at Bristol, and entered upon the work of preaching in different parts of Wiltshire. In due time he entered the itinerant connection, and was appointed to London circuit, and subsequently to Newcastle, Edinburgh, Bradford, Sheffield, Hull, Birmingham, Manchester, and other prominent places. After the death of Mr. Wesley he was appointed president of the conference, a position which he occupied for some time. While stationed in London, where he continued for 4 years, he commenced writing his commentary, and edited the "Wesleyan Magazine." Such was his popularity as a preacher, that vast crowds flocked to hear him. He was sent for in every direction to open new chapels and attend to the various interests of the denomination as president of the conference. In the 65th year of his age, he completed his commentary in 5 volumes quarto. This work has been very popular, both in England and America, among the Methodists, and still holds a prominent place in the literature of the church. He wrote, in the early part of his ministry, an "Essay on the Immortality of the Soul," and also one on the "Unscriptural nature of Socinianism." Toward the close of life he edited "Arndt's True Christianity," and continued up to the day of his death to conduct the magazine.

**BENTHAM, JEREMY**, an English juridical philosopher, born in London, Feb. 15, 1748, in Red Lion street, near Aldgate church, died in Queen-square place, Westminster, his residence for 40 years previously, June 6, 1832. His great-grandfather, a prosperous London pawnbroker of the time of Charles II.—a more reputable calling then than now—had acquired some landed property which remained in the family. His grandfather was a London attorney; his father, who followed the same profession, was a shrewd man of business, and added considerably to his patrimony, principally by fortunate purchases of land and

leases. These London Bentham's were probably an off-shoot from an ancient Yorkshire family of the same name, which boasted a bishop and many clergymen among its members; but the subject of this notice did not trouble himself much to trace his genealogy beyond the pawnbroker. His mother, Alicia Grove (whose beauty and amiability captivated his father at first sight, and prevailed over the temptation of a wealthier match which his family had in view for him), was the daughter of a retired Andover shopkeeper. Jeremy Bentham, the eldest, and for 9 years the only child of this marriage, was for the first 16 years of his life exceedingly puny, small, and feeble. At the same time he exhibited a remarkable precocity, which greatly stimulated the pride as well as affection of his father. At the age of 8 years, as he was not allowed story-books, he amused himself with reading Rapin's "History of England." He had a decided taste for music, and at 5 years of age acquired a knowledge of musical notes and learned to play the violin. At 4 or earlier, having previously learned to write, he was initiated into Latin grammar, and in his 7th year entered Westminster school. Meanwhile he was taught French by a private master at home, and at 7 read *Telemachus*—a book which strongly impressed him. Learning to dance was a much more serious undertaking; he was so weak in the legs as to make it laborious and painful. Young as he was, he acquired distinction at Westminster, as a fabricator of Latin and Greek verses, the great end and aim of the instruction given there. When 12 years old he was entered as a commoner at Queen's college, Oxford, where he spent the next 8 years. The young Bentham had not been happy at school. He had suffered from the tyranny of the elder boys, though he escaped the discipline of corporal punishment, and was but once forced into a boxing match. Neither was he happy at Oxford. Though regarded by others and taught from infancy to regard himself as a prodigy, he was yet exceedingly diffident, and to the highest degree sensitive of any slight or neglect—peculiarities which, as well as his high estimate of himself, clung to him through life. His tutor was morose, the college dull, while his sensitive pride suffered much from the mingled penuriousness and meddlesomeness of his father, who kept him on very short allowance; and who, in spite of all his affection for his son, of whose ultimate distinction he had formed the highest hopes, failed entirely to comprehend the boy's delicacy and diffidence, and never gained either his confidence or his love. His mother had died 2 years before he entered the university, leaving him an only brother, afterward Sir Samuel Bentham. Several years after his father married for a second wife the widow of a clergyman already the mother of 2 boys, of whom the eldest, Charles Abbot, was afterward speaker of the house of commons, and finally raised to the peerage as Lord Colchester. There were no children by this second marriage, yet it was a

source of great vexation to Bentham, to whom his mother-in-law was far from being agreeable. Though very uncomfortable at Oxford, Bentham went through the exercises of the college with credit and even with some distinction. Some Latin verses of his on the accession of George III. attracted considerable attention as the production of one so young. Into the disputations which formed a part of the college exercises he entered with much satisfaction; but he never felt at home in the university, of which he retained the most unfavorable recollection. In his old age, he seldom spoke either of Westminster school or Oxford but with asperity and disgust. In 1768, while not yet 16, he took his degree of A. B. Shortly after, he commenced eating his commons in Lincoln's Inn, but went back to Oxford to hear Blackstone's lectures. To these lectures he listened without the presumption, at that time, to set himself up as a critic, yet not without some occasional feelings of protest. Returning to London, he attended, as a student, the court of king's bench, then presided over by Lord Mansfield, of whom he continued for some years not only a great admirer, but a profound worshipper. Among the advocates, Dunning's clearness, directness, and precision, most impressed him. He took his degree of A. M. at the age of 18, the youngest graduate, so says Dr. Southwood Smith, that had been known at either of the universities; and in 1772 he was called to the bar. Bentham's grandfather had been a Jacobite; his father, educated in the same opinions, had, like others of that party, transferred his sentiments of loyalty to the reigning family. The young Bentham had breathed, from infancy, at home, at school, at college, and in the courts, an atmosphere conservative and submissive to authority. Yet, in the progress of his law studies, beginning to contrast the law as it was with law such as he conceived it might be, and ought to be, he came gradually to abandon the position of a submissive and admiring student, anxious only to make of the law a ladder by which to rise to wealth and eminence, for that of a sharp critic, an indignant denouncer, a would-be reformer. His father, who fondly hoped to see him lord chancellor, had some cases in nurse for him on his admission to the bar, and took every pains to push him forward. But it was all to no purpose. His temperament, no less than his moral and intellectual constitution, wholly disqualified him for success as a practising lawyer. He soon abandoned with disgust, to the infinite disappointment of his father, all attempts in that line. With a feeling in the highest degree distressing of having failed to fulfil the high expectations formed of him by his friends, and entertained by himself, he continued for years, to borrow his own words, "to pine in solitude and penury in his Lincoln's Inn garret," living on a very narrow income, drawn partly from some legacies, and partly from a small property conveyed

to him by his father at the time of his second marriage. Still, however, he continued a dilligent student and serious thinker, amusing himself with chemistry, then a new science, though mainly devoted to jurisprudence, but rather as it should be, than as it was. The writings of Hume and Helvetius had led him to adopt utility as the basis of morals, and especially of legislation; and already he began to write down his ideas on this subject—the commencement of a collection of materials for, and fragments of, a projected, but never completed code, which, for the whole remainder of his long life, furnished him with regular and almost daily employment. In the controversy between Great Britain and her American colonies, which became at this time a leading topic of public discussion, Bentham did not take any great interest. His tory education, and his idea of the law as it was, led him, unwarpd, as he says, by connection or hopes, to favor the government side. In the arguments on behalf of the colonies, used on either side of the water, he saw nothing to change his mind. "The whole of the case," to borrow his own statement, "was founded on the assumption of natural rights, claimed without the slightest evidence of their existence, and supported by vague and declamatory generalities." Had the argument been placed on the ground of the impossibility of good government at such a distance, and the benefits that would accrue to both parties from a separation—grounds more in accordance with his ideas of the true basis of laws—it would then have attracted his attention. As it was, he had some hand, though small, in a book, "Review of the Acts of the 13th Parliament," published in 1775, by a friend of his, one John Lind, in defence of Lord North's policy. The next year he ventured to print a book of his own, under the title—the first part of it so appropriate to the character of all his writings—of "A Fragment on Government." He had contemplated a critical commentary on the commentaries of Blackstone, then lately published; but in this piece, he confined himself to what Blackstone says of the origin of government. Rejecting the fiction of an original contract, suggested by Locke, and adopted by Blackstone, he found government sufficiently warranted and justified by its utility; while in place of conformity to the laws of God and nature, which appeared to him to rest too much in vague assertion and opinion, he suggested "the greatest happiness of the greatest number" as a precise and practicable test of right and wrong, both in morals and laws. This pamphlet, for it was scarcely more, appeared anonymously, and attracted at first some attention. It was even ascribed to Mansfield, to Camden, and to Dunning. The impatient pride of Bentham's father having led him to betray the secret of its authorship, the public curiosity, which had been aroused by the work, not in its character of a philosophical treatise, but of a personal attack, speedily subsided. A second pamphlet, publish-

ed in 1778, a criticism, though, on the whole, a friendly one, on some amendments to the law of prison discipline, prepared in the form of a printed bill, with a preface to it by Mr. Eden (afterward Lord Auckland), assisted by Blackstone, did not attract much more attention. He was also disappointed in an attempt which he made, at this time, to be appointed secretary of the commission sent out by Lord North to propose terms to the revolted American colonies—a place already, before his application was made, given to Adam Ferguson. Meanwhile his writings, though neglected at home, yet served to make him known at Paris, whence he received letters addressed to him in the character of a philosopher and reformer from D'Alambert, Morellet, Chastellux, Brissot, and others. They also gained for him the acquaintance and friendship of Lord Shelburne, who in 1781 paid him a visit in his Lincoln's Inn garret. After much urging, Shelburne at length prevailed upon him to become a visitor at his country seat of Bowood. The ice once broken, Bentham became a frequent inmate there, and a great favorite, especially with Lady Shelburne. He was indeed more noticed by the ladies, whose musical performances he accompanied on the violin, than by Camden, Barré, and other great men of the day whom he met there. Still this introduction to Bowood was a great thing for Bentham. It raised him, as he himself expressed it, from the "bottomless pit of humiliation" into which he was fast sinking, and inspired him with new confidence in himself and new zeal for his favorite studies. He had also the additional excitement of falling in love. A very young lady whom he met there, whose frank simplicity was in strong contrast with the stiffness and prudery which was the prevailing style at Bowood, made an impression on his heart, which, though it did not result in marriage, yet lasted through life. Already before his acquaintance with Lord Shelburne he had printed part of an introduction to a penal code which he had undertaken to construct; but the unfavorable or lukewarm opinion of his undertaking expressed by Camden and Dunning, to whom Shelburne had shown the sheets, and by some other friends whom he consulted, joined to his ill-success in finishing the work to his mind, long kept this printed fragment unpublished.—In 1785 he left England on a visit to his younger brother, then employed, with the rank of colonel in the Russian army, in the service of Prince Potemkin, in an abortive scheme, of which Krikov on the Don was the seat, for introducing English methods in manufactures and agriculture into that barbarous region. Furnished with funds by a maternal uncle, Bentham proceeded by way of Paris, his third visit thither, across the Alps to Leghorn. There he embarked in an English ship for Smyrna, and from Smyrna sailed in a Turkish vessel to Constantinople. After passing several weeks in that city, he travelled by land through Bulgaria, Wallachia, Moldavia, and the Uk-

rairie, to his destination in White Russia. Here he spent a year and a half, living most of the time a very solitary life, devoting himself amid many annoyances and privations, among which was want of books, to his favorite studies. Tired out at last, in the absence of his brother, detained at Kherson by an expected attack from the Turks, he started for home by way of Poland, Germany, and Holland, and reached England in the spring of 1788. While residing at Krikov he had written his "Letters on Usury," occasioned by the report that the legal rate of interest was to be lowered. He sent the manuscript to England; his father caused it to be printed while he still remained absent, and it proved with the English public the most successful of his works. Renewing his visits to Bowood, he there met Romilly, whom he had known slightly before, and with whom he now formed an intimacy which lasted as long as Romilly lived. He now also first formed the acquaintance of the Swiss Dumont, who had been domesticated at Lord Shelburne's during his absence. Bentham had become so much disgusted at his failure to attract attention in England that he had adopted the idea of publishing in French, and had made some essays in that language. Romilly had shown some of these French sketches to Dumont, who, very much impressed by them, offered his services to correct and re-write them with a view to publication. Another friend of Bentham's, with whom he had kept up a correspondence while absent in Russia, had written to him of Paley's success in applying the principle of utility to morals, and had urged him to set to work to complete some of his own treatises; or at least to publish the already printed part of his introduction to his unfinished penal code. These sheets, after lying in hand for 8 years, were now at length published under the title of "An Introduction to the Principles of Morals and Legislation," but they attracted very little attention. Dumont, however, who about this time went to Paris, and became connected with Mirabeau, aided to spread Bentham's reputation, and in the *Courrier de Provence*, of which he was one of the editors, gave publicity to some of his manuscripts. Meanwhile Bentham, with the idea of aiding the deliberations of the states-general, then about to meet, drew up and printed, but did not publish, his "Parliamentary Tactics," and with the same object in view prepared and printed a "Draft of a Code for the Organization of the Judicial Establishment in France;" services which the national assembly recognized, by conferring on him the citizenship of France, in a decree (Aug. 23, 1792), in which his name was included with those of Priestley, Paine, Wilberforce, Clarkson, Mackintosh, Anacharsis Olooto, Pestalozzi, Washington, Klopstock, Kosciuszko, and several others. In this character of French citizen, Bentham next year addressed to the national convention a new pamphlet, "Emancipate your Colonies," the first work which laid down the principle of

ranking colonies as integral parts of the mother country.—While residing at Krikov, Bentham's attention had been attracted by an architectural idea of his brother's, who was a person of great mechanical genius, though like himself given to running from one thing to another without stopping to finish any thing. This idea was that of a circular building so constructed as that from the centre all the inmates could be overlooked. The younger Bentham had attempted to realize it with a view to the oversight of his Russian workmen. The elder brother seized upon it, in connection with his study of penal legislation, as applicable to prison discipline. He gave to this building the name of Panopticon, and while still in Russia wrote a series of letters in explanation of its construction and its uses. These letters, after his return, were printed at Dublin by the Irish parliament, the adoption of his prison discipline scheme having been proposed there. In 1791 they were brought out at London, with additions, under the title of "Panopticon; or, the Inspection House."—In 1792 Bentham's father died, leaving him the family mansion in Queen's-square place, Westminster, where he chiefly resided for the rest of his life, and a freehold and leasehold property of between £500 and £600 a year. He left about an equal amount to the younger brother, who by this time had returned from Russia, and had zealously entered with his elder brother into the perfecting of the Panopticon, with a view to apply it to prison discipline. Being now possessed of means, Bentham, in conjunction with his brother, submitted plans to Mr. Pitt for taking charge of 1,000 convicts, in a building to be erected for that purpose, at the expense of the government; but—upon certain conditions, and at a certain rate of pay for each convict—to be under the entire control of the Benthams for their joint lives. Mr. Pitt, Mr. Dundas, Mr. Rose, and others, entered with much enthusiasm into the idea, and in 1794 an act of parliament authorized the contract. The Benthams obtained an advance from the treasury, and spent several thousand pounds of borrowed money on the strength of this arrangement, involving themselves thereby in great embarrassments, but from some mysterious cause, could not get any further advances, nor a signature of the contract. The ministers, however, continued favorable, and made use of a parliamentary committee, in 1797, to urge the completion of the contract, when at length the hitherto mysterious delay was explained, and the affair again brought to a standstill, by the refusal of the king to sign a treasury warrant for a sum of money needed to perfect the title to the land on which the building was to be erected, and for which considerable expenditures had already been made. George III. had taken an antipathy to Bentham, partly, as Bentham believed, from having looked into his treatise on the organization of the French judiciary, and partly because he had discovered him to be the author of 2 newspaper articles signed "Anti-Machi-

avel," and published in 1787, attacking the policy of a war with Russia, which the king had much at heart. Thirteen years more were spent in vain solicitations, till finally, in 1811, an act of parliament annulled the contract, and provided for the erection of a prison on a different plan, and at much greater expense to the public. In order to get a conveyance of the land, the imperfect title of which stood in Bentham's name, this act provided for an award on the question of damages, under which the Benthams, 8 years after, received the sum of £28,000. It may well be supposed that Bentham's experience in this matter could not but embitter him against the existing management of public concerns.—Meanwhile, Dumont, having returned to England, had obtained from Bentham all his manuscripts, and had applied himself with zeal to the task of extracting from them, and his printed works, a vivid and popular statement, in French, of Bentham's system and ideas. This labor of love Dumont performed with remarkable success; and the first fruits of it, published at Paris in 1802, during the peace of Amiens, under the title of *Traité de législation civile et pénale*—a publication in which Talleyrand took a great interest, offering himself, if necessary, to bear the whole expense—speedily made Bentham known and famous throughout the continent of Europe as the philosopher of jurisprudence. In England, too, he acquired some new disciples and coöperators. Brougham joined Romilly in acknowledging his genius, and accepting many of his ideas. In 1808 he formed the acquaintance of James Mill, who, next to Dumont, did most to diffuse his doctrines. Mill lived for several years, a large part of the time, in Bentham's house, who still labored away some 6 or 8 hours daily on his codes, stopping, however, as occasion offered, to launch forth vehement attacks on the English system of jurisprudence. Such was his "Scotch Reform compared with English Non-Reform," published in 1808, and his "Elements of the Art of Packing as applied to Special Juries," printed in 1808, but which he was dissuaded by Romilly from publishing, lest it might expose him to a prosecution for libel. Some difficulty was even met with in finding a publisher for the "Rationale of Judicial Evidence," edited by Mill, from Bentham's manuscripts, lest that, too, especially the part of it assailing the whole technical method of English judicial procedure, might be regarded as a libel on the administration of justice. Nor, indeed, did this work appear till 1827, when it was published in 5 vols. 8vo. Confirmed, meanwhile, by his growing reputation, in his always strong interior faith in himself, Bentham became anxious to bring out, not as a mere draft, but as an actual body of law, his ideal code, on which he had been laboring all his life, but which yet existed only in his brain, and in an immense mass of fragmentary manuscripts. He had hoped, on the strength of promises from Miranda, to become the legislator of

Venezuela, to which country he had even thoughts of removing. But Miranda's project failed. In 1811—Dumont having in that year brought out a new French work, edited from his manuscripts, *Théorie des peines et des récompenses*—he addressed an elaborate letter to President Madison, offering, upon the receipt of a letter importing the president's approbation, and, as far as depended upon him, acceptance of his proposition, to forthwith set about drawing up for the use of the United States, or such of them as might accept it, "a complete body of law; in one word, a pannonion, or as much of it as the life and health of a man, whose age wanted little of four and sixty, might allow of," asking and expecting no reward beyond the employment and the honor of it. This letter, beside a sketch of his plan, which embraced not merely the text of a code, but a perpetual running commentary of reasons, included also a vigorous attack upon the existing system of English and American jurisprudence, and an answer to certain anticipated objections, both to the plan, and to himself as legislator. Mr. Brougham wrote at the same time to some American friends, expressing his opinion that no person in Europe was so capable as Bentham of such a task. No answer had been received to this letter when, in 1814, Mr. Gallatin was a little while in England, in his capacity of commissioner, to treat for peace. Not only had Gallatin received from Dumont, who was his countryman, a presentation copy of the *Traité de législation*, but he had, as he told Bentham, who had an interview with him, been his disciple for 25 years, in consequence of having read, soon after its publication, a copy of the "Introduction to the Principles of Morals and Legislation," put into his hands by Colonel Burr. We may mention, by the way, that Burr himself, when in England, 6 years before, had obtained an introduction to Bentham from Dumont, and had even passed a considerable time under his roof—one object of Bentham doubtless being to avail himself of Burr's knowledge of American affairs. In consequence of this interview with Gallatin, Bentham was led, in a letter to Governor Snyder, of Pennsylvania, enclosing a printed copy of his letter to Madison, and a letter of introduction from Gallatin, to renew his offer of himself, as a codifier. At length, in 1816, Madison returned a courteous reply to Bentham's letter of 1811, referring to the intervening war as an apology for his long silence, stating that a compliance with Bentham's proposals was "not within the scope of his proper functions," suggesting some obstacles to the proposed codification, and objections to it, but fully admitting the desirability of such a reform. This letter was conveyed to London by J. Q. Adams, appointed American minister to England, and who became, during his residence there, intimate with Bentham. When Adams returned home, in 1817, to assume the office of secretary of state, he became the bearer of a circular letter, addressed by Bentham to the

governors of the states, accompanied by copies of the letter to Madison, and a renewal of his offer of himself as legislator. Bentham's proposals, which he followed up by a series of short letters on the same subject, addressed to the people of the states, were laid before the legislatures of Pennsylvania and New Hampshire. He received appreciative letters from Governors Snyder and Plumer, of those states; but nothing further resulted. Several years later, Edward Livingston sent him a copy of his draft of a penal code for Louisiana, with strong expressions of admiration for his genius, and acknowledgments of the instruction received from the study of his works. Meanwhile, in 1814, Bentham had made an offer of his legislative aid to the emperor of Russia, in the language of which country 2 translations had appeared of the *Traité de législation*, one of them, it was said, by the special procurement of the government. The emperor replied in a letter written by his own hand, in which he promised to submit Bentham's proposal to the commission at work on a code for the empire. He sent, at the same time, a valuable ring, which Bentham returned, sending with it a second letter, in which he gave reasons why nothing could be expected to come of the reference of his proposals to a commission which, in one shape or another, had been in session for more than a century without any result. In the expectation that Prince Adam Czartorisky, who was one of his disciples, would be appointed regent of Poland, he had hopes of legislating for that country, but another person was appointed and this hope failed. The revolutions of 1820, which established liberal governments in the Spanish peninsula, gave Bentham new and stronger hopes. Dumont's compilations had been translated into Spanish, and were well known to the leading liberals of Spain and Spanish America. The Portuguese cortes caused them to be translated into Portuguese. In 1822 he published also his "Codification Proposal," addressed to all nations professing liberal opinions, tendering his services as legislator, and arguing in favor of a code emanating from a single mind. He was consulted on the Spanish penal code, on which, in 1822, he published some letters addressed to the conde de Toreno, and similar applications were made to him from Spanish America. But the downfall of liberalism in the peninsula, and the protracted civil wars in the late Spanish colonies, disappointed his expectations in that quarter.—While thus seeking the office of legislator, another idea had engrossed much of his attention. He had taken a great interest in the educational system of Bell and Lancaster, and in 1817 he had published, under the title of "Chrestomathia," a proposal to apply this system to the higher branches of education. There was even a scheme for erecting a building in his garden on the Panopticon system, in which the experiment was to be tried; but, like so many other of his plans, it did not go on.—Though Bent-

ham had always boasted of being a man of no party, as well as of all countries, he had come at length to occupy at home the position of a party chief. He espoused with characteristic zeal and enthusiasm the ideas of the radicals—who now first appeared as a political party. He went, indeed, the full length, not merely of republicanism, but on many points of democracy. He wrote pamphlets and drew up plans in behalf of parliamentary reform and other movements of the radicals, and became a sort of spiritual head of the party. It was he who furnished the money to set up the "Westminster Review," established in 1823 as the organ of the radicals. The political editor was Mr. Bowring (the present Sir John Bowring), with whom Bentham had formed an acquaintance through their mutual interest in the Spanish liberal movement. That acquaintance speedily ripened into a very close intimacy and friendship, which lasted to the end of Bentham's life. His connection with the radicals, and his vehement attacks on law abuses and the lawyers, had rather cooled off Lord Brougham, but in his place Bentham acquired a new disciple and pupil, in the person of Daniel O'Connell. Mr. Peel, in his movements in the house of commons for the amendment of the criminal law, seemed to be starting in Bentham's direction. Bentham even entertained the hope that he might persuade the duke of Wellington, with whom he corresponded, to undertake, in addition to Catholic emancipation, those reforms in the administration of justice which Cromwell had attempted, but in which the lawyers had baffled him. The acknowledgment of his genius by the most eminent men of his times, his world-wide reputation, and the share he was now taking in the actual movement of affairs, more than made up for the sneers, to which, indeed, he paid no attention, cast at him as a visionary schemer; and the satisfaction and even gayety of the latter part of his life formed a strong contrast with the gloom of his youth and early manhood. In his last 10 years he seldom left his own home, taking exercise in his garden. He retained to the last his love of music, of pet animals, cats particularly, and of flowers, but spent regularly 6 or more hours a day in composition, employing generally 2 secretaries. He saw no company, except at dinner. His hour of dining was 7; his table was delicately spread, but admission to it, though he generally had 2 or 3 guests, was only obtained as a particular favor. Dinner was followed by music on the organ. He was of a gay and lively temper, hopeful, enthusiastic, and, in spirit, young to the last. His last published work was his "Constitutional Ode," of which a volume appeared in 1830. At the time of his death he was engaged with Bowring in an attempt to present his fundamental ideas in a more popular form. This work was published in 1834, after his death, under the title of "Deontology." Bentham gave a practical exemplification of his principles by bequeathing

his body to his friend, Dr. Southworth Smith, for the purpose of dissection. A collection of his works, in 11 vols. 8vo, published at Edinburgh, under the supervision of Bowring, his executor, was completed in 1843. It includes, at the end, a memoir made up principally of letters and of Bentham's reminiscences, as noted down by Bowring, very badly put together, but containing a great deal of interesting matter. Dumont, just before his own death, edited and published, at Brussels, in 1828, a complete collection of his compilations from Bentham in 6 double volumes, demi-octavo. A translation into English of the *Traité de législation* was published at Boston in 1840, under the title of "Theory of Legislation." It is from this work, a translation of which, with some additions from Bentham's manuscripts, is included in Bowring's edition of Bentham's works, that the general reader will best obtain a knowledge of Bentham's system. In his earlier writings, and in many of his pamphlets, Bentham expresses himself with great terseness and energy, but in his didactic works he often loses himself in parentheses, and protracts his sentences to a tedious length. In his later writings he sacrificed every thing to precision, for which purpose he employed many new words, some of which, such as international, codify, codification, maximize, minimize, &c., have become permanent additions to the language. His analysis of human nature, on which he based his system, can hardly rank him high as a metaphysician; his employment of the exhaustive method of reasoning frequently led him into useless subdivisions and unnecessary refinements; but he had a very acute intellect, a thorough devotion to truth, a strong spirit of benevolence, unwarped by any selfish or party views. Unawed by authority, he appealed to reason alone, and, having devoted his whole life to the study of jurisprudence, his works abound with suggestions and ideas as novel as they are just. Nobody has been so much plundered as Bentham, said some one to Talleyrand. "True," he replied; "yet how rich he still is." In the improvements introduced of late years into the administration of the law, both in England and America, many of his suggestions have been followed, often without acknowledgment, or even knowledge, perhaps, of the source whence they originated. There are many more of his ideas that may yet be put to use. The 4th part of his treatise on the penal code, as published by Dumont, of which the subject is the indirect means of preventing offences, contains a mine of wisdom, which the numerous members of our legislative bodies might explore with advantage.

BENTHAM, THOMAS, an English Protestant clergyman, born in Sherburn, Yorkshire, in 1518, died in 1578. He was noted for the boldness with which he asserted his religious principles during the reign of Queen Mary, and was distinguished by the favor of Elizabeth in the settlement. Appointed fellow of Magdalen college, Oxford, he

freely expressed his religious sentiments, and was sometimes rather forgetful of the proprieties and courtesies of life, in the resolution to maintain his opinions. On one occasion, in 1558, he knocked the censor out of the hands of the officiating priest at mass, "in order to prevent incense being offered to idols." For this breach of decorum he lost his place, although the laws concerning religion were still in force. He then travelled on the continent, visiting successively Zurich, Frankfort, and Basel, at which latter place he employed himself in expounding the Scriptures to the English exiles who had taken refuge in that city. On his return to England, before the close of Mary's reign, he ministered privately to a Protestant congregation in London. Here he also nearly involved himself in personal difficulty, by the boldness with which he advanced his Protestant opinions. At the burning of some Smithfield martyrs, Mary had forbidden that any one should speak to them, or pray for them, on pain of similar punishment. Bentham, so soon as he got sight of them, deserted by his self-control, or else deliberately, cried out, "May God have mercy on them," with sundry other ejaculations, which called out a hearty round of "Amen" from the promiscuous multitude. On the accession of Elizabeth, Bentham was appointed to the pulpit of Paul's Cross—then a very influential station—and soon after, in 1559, to the see of Lichfield and Coventry. He was opposed to preserving in the Protestant church the forms and habits of Rome, but yielded to the policy of Elizabeth in the matter. He published an exposition of the Acts of the Apostles, and translated into English some parts of the Old Testament.

BENTINOK, the name of a distinguished noble family, of German origin, in England, with extensive connections in Germany and Holland. The English line was founded by JOHANN WILHELM, born in 1648, died in England in 1709; educated with William of Orange, whom he accompanied to England, and who made him earl of Portland. He was prominent in the battle of the Boyne, and in the peace of Ryswick. William III. died in his arms.—HENRY, his son, was made duke of Portland in 1716, and died in 1736, as governor of Jamaica.—WILLIAM, son of Henry, born 1708, died 1762; married Margaret Cavendish, a name which has since remained in the family.—Lord WILLIAM CHARLES CAVENTISH, second son of the 8d duke of Portland, born Sept. 14, 1774, died at Paris, June 17, 1839. Entering the army at an early age, he served in Flanders, with the duke of York; was colonel in the army before he was 21. In 1799 he joined the Russian army under Suwaroff, in Italy, where he continued in active service until 1801; went out to India, as governor of Madras, in 1808; was made major-general on his return in 1806; was sent on a mission to the Spanish court in 1808, relative to the French invasion of Spain; commanded a brigade, under Sir John Moore, at Corunna, in

Jan. 1809; went to Sicily in 1810, as plenipotentiary and commander-in-chief of the English troops there; bestowed a constitution on that island in 1819; conducted the expedition from Sicily to Catalonia, in 1818, to operate in the rear of the French armies, but was compelled to make a hasty retreat; took possession of Genoa, in 1814, when the inhabitants revolted from the French, and threw up his commission in disgust when the Genoese (who claimed the reestablishment of their republic under England, under the convention which had been made) were given over to Piedmont. By this time he was lieutenant-general. Returning to England, he was elected member of parliament for Nottingham, and voted with the liberal party. He subsequently was raised to the rank of full general, and was, in 1827, under the government of Mr. Canning (a family connection by marriage), sent to India as governor-general, in which capacity he continued until 1835, when ill health compelled him to resign. The results of his Indian rule were: the reduction of the batta (allowances made to the troops on the march), much to the discontent of the army; the abolition of flogging among the native troops, British soldiers serving in the same country remaining subject to it; the prohibition of the suttee, or burning alive of the widow on the funeral pile of her husband; the granting Englishmen leave to settle in India, though not belonging to the military or civil service; the upholding of the native population as far as possible; and the protection of the liberty of the press. Some of these alterations were made by order of the East India directors in England, and some were carried out contrary to the wish of the directors. In 1834 he made war on the rajah of Coorg, annexed his territory, and pensioned him off. When he quitted India, the natives, who looked upon him as the best friend they had had since the time of Warren Hastings, expressed their regret, at a public meeting in Calcutta, and testified their respect by erecting an equestrian statue of him. The court of directors in England, respecting his integrity and firmness, though they had sometimes differed in opinion with him, gave him a warm reception on his return. He reentered the house of commons in 1836, for the city of Glasgow, but was too much of an invalid to take an active part in politics or legislation, and resigned his seat a few days before his death, in his 65th year.—**LORD WILLIAM GEORGE FREDERIC CAVENDISH**, an English politician, born Feb. 27, 1802, died Sept. 21, 1848, 8d son of William Henry Cavendish, 4th duke of Portland (by Henrietta, daughter and co-heiress of Major-general Scott); he received the baptismal names of William George Frederic, but was commonly known only by the second. Though a younger son, he inherited a large fortune from his mother. He entered the army and rose to the rank of major. Mr. Canning, who had married his aunt, took him as private secretary, when he was foreign minister, and, pleased with his

frank nature, capacity for business, and trustworthy character, admitted him into his fullest confidence. In 1837, when Mr. Canning became prime minister, Lord George Bentinck entered parliament for the borough of King's Lynn, for which he continued to sit during the rest of his life. He was constant in attending the house, but spoke rarely and then not effectively. Nature had not made him an orator. Mr. Canning died in August, 1837, after a premiership of four months, and Lord Goderich (created earl of Ripon in 1838) succeeded Canning, and received the parliamentary support of Lord George—probably because the duke of Portland, his father, was in the cabinet. When the duke of Wellington brought in the Catholic relief bill of 1829, Lord George voted for it, and subsequently supported Lord Grey's ministry, during the reform bill debates, and until the succession of Lord Ripon, Sir James Graham, and Lord Stanley (now earl of Derby), in 1834. Similarity of tastes—both being fond of horses and racing—drew him so strongly to Lord Stanley, that, in Dec. 1834, when O'Connell quoted the lines from the "Anti Jacobin":

So down thy steep, romantic Ashbourne, glides  
The Derby dilly, carrying six inside,

Lord George was one of the half dozen. He warmly supported Sir Robert Peel, during his short tenure of office, 1834-'5; strongly denounced what he called "the Lichfield house compact" (between O'Connell's Irish party and the whigs), by which Peel was compelled to resign office; warmly supported him in opposition until 1841, and declined an offer of office made to him at that time, on Peel's again becoming prime minister. For some time after, Lord George voted with Sir Robert; but, in 1843, when free trade principles began to pervade ministerial measures, many of the Peel party, who, as landed proprietors, considered protection indispensable for the maintenance of agriculture, became alienated from their chief. In 1846, when Sir Robert announced his intention of repealing the corn laws, many adherents quitted him. The protection party were about 240. They had no leader. Lord Stanley, who certainly would have been their head, had he remained in the house of commons, had been called up to the house of lords, in the course of the previous year. A man of weight, standing, experience, character, industry, vigilance, skill, eloquence, and tact, was required. No one thought of Lord George. The assault, on the opening of the contest on free trade in corn, was commenced by Mr. Disraeli. So long had Lord George been a silent member of the house, that no one—not even himself—anticipated that he could summon up confidence to be an active debater. An amendment on one of the government resolutions had been moved by Mr. Miles, and a long debate ensued. On the 12th night, when a division was eagerly looked for, Lord George Bentinck threw himself into the strife. It was long after midnight when he spoke but

his mind was filled with as thorough a knowledge of the subject as any one possessed; he was master of all the facts; he remembered all the figures; he possessed strong natural powers of rapid calculation; and, dismissing his timidity, he entered into the discussion, showing an intimate knowledge of the details and working of the British commercial system, evading no point, shrinking from no investigation. From that hour he was leader of the protectionists, with Mr. Disraeli as his assistant, and, though the contest was unsuccessful, his reputation was deservedly great. He never rose to eloquence, but earnestness, boldness, and plain language, combined to make him impressive and formidable. The public, who had previously known him only as a liberal patron of the turf—accepted, indeed, as a ruling authority on the race-course, and very anxious to substitute fair play and honorable principle for chicanery and trickery—exaggerated his efficiency. Thenceforth, until his death, Lord George was the first man, on the opposition side, in the commons. He studied the leading questions closely, and generally threw light upon every discussion. The session of 1848 had ended, and he went to his father's seat (Welbeck abbey, Nottinghamshire) to recruit. He had returned from Doncaster races, where one of his horses had won the great St. Leger stakes, and left the abbey to walk across the fields, to pay a visit to Lord Manvers, one of his neighbors. A mile from the house he had an attack of spasms of the heart, which was immediately fatal. He was found dead on a footpath through a meadow. The news of his decease, so sudden and so sad, smote the public mind with awe and grief. The funeral was most private, but as Mr. Disraeli, his biographer, records, "from 9 till 11 o'clock that day all the British shipping in the docks and the river, from London bridge to Gravesend, hoisted their flags half-mast high, and minute guns were fired from appointed stations along the Thames. The same mournful ceremony was observed in all the ports of England and Ireland; and not only in these, for the flag was half-mast high on every British ship at Antwerp, at Rotterdam, at Havre." Lord George Bentinck was singularly temperate and abstinent. He was unmarried. The continental branches of the Bentinck family bear the name of Bentinck-Rhoon, and Aldenburg-Bentinck.

BENTIVOGLIO, the name of a family once sovereign at Bologna, of which several members have been distinguished in Italian history. I. CERNELIO, a cardinal, born at Ferrara in 1668, died at Rome, Dec. 30, 1732. Under Clement XI., he became archbishop of Oathage, and nuncio in France, where he showed great zeal in behalf of the bull *Unigenitus*. He was recalled to Italy in 1719, and elected cardinal, after which he was sent as nuncio to Spain. He was a patron of literature, and was himself learned in law and the sciences, as well as in theology. There remain from him several dis-

courses, a translation of the *Thebais* of Statius, and some sonnets. II. ESCOLLE, a poet, born 1512, died Nov. 6, 1578. He was scarcely 6 years old when his father, Annibale II., the last Bolognese sovereign who strove to maintain Bologna against the popes, was expelled, and betook himself to Ferrara, where his relatives, the princes of Este, offered a home, and subsequently diplomatic employment, to Ercole, who was a most accomplished person, excelling in poetry, music, and gymnastic exercises. He wrote sonnets, eclogues, satires, and comedies. III. GUNDO, born at Ferrara in 1579, died Sept. 7, 1644. He was raised in 1621 to the dignity of cardinal. As papal nuncio in Paris, he discharged his duties so successfully, that Louis XIII., on his return to Rome, appointed him protector of the interests of France at the Vatican. After having served three popes with so much distinction, it was supposed that he would himself ascend the papal throne, but he died almost immediately after the opening of the conclave.

BENTLEY, GIDEON, an American soldier, remarkable for his longevity, and for the excellent though humble services which he rendered to his country as soldier in the revolutionary war, was born in 1751, and died at Constantia, Oswego co., N. Y., in Jan. 1858, aged 107 years.

BENTLEY, RICHARD, classical scholar and critic, born at Oulton, near Wakefield, England, Jan. 27, 1662, died July 14, 1742. The son of a yeoman or small farmer, he was educated at Wakefield grammar school, whence, at the age of 13, he was transferred as a sizar to St. John's college, Cambridge. He took his degree of B. A. with distinction, his place in the arrangement of honors corresponding with that of third wrangler in the present system. From a fellowship in his own college, the most obvious resource of a young scholar, he was excluded by a by-law which was not rescinded until the reign of George IV. In 1682 he was appointed by his college to the head mastership of Spalding grammar school, and, after holding it for a year, quitted it for the more eligible situation of domestic tutor to the son of Dr. Stillingfleet, then dean of St. Paul's, where he had full use of the dean's fine library, one of the best collections in England, and constant association with the dean. Here Bentley acquired that Biblical learning which afterward entitled him to the divinity professorship, and which warranted his proposals for a revised text of the New Testament. He remained with Stillingfleet for 6 years, and then, early in 1689, accompanied his pupil to Oxford, where he himself was admitted, *ad eundem*, to the degree of M. A. he had previously taken at Cambridge. He made constant use of the Bodleian library, largely increased his knowledge of the oriental languages, became acquainted with the leading men of the university (through introductions from Stillingfleet, now bishop of Worcester), and more particularly with Dr. John Mill, the

editor of the Greek Testament. Bentley's first publication, in 1691, was a Latin epistle to Mill, on an edition of the "Chronicle" of John Mafela, and his reputation as a scholar and a critic was at once established by it, in foreign countries as well as at home. At this time, he projected an entire edition of the "Fragments of the Greek Poets," and also a *Corpus* of the Greek lexicographers, neither of which he accomplished. He took holy orders in 1690. The celebrated Robert Boyle, who died at the close of the year 1691, bequeathed an annual stipend for the foundation of a lecture in defence of religion against infidels. Bentley obtained the first nomination early in 1692, and the lectures which he delivered established his reputation as a preacher. In October of the same year he was appointed a prebendary at Worcester; in April, 1694, keeper of all the king's libraries, and again selected as Boyle lecturer; in 1695 he was made one of the chaplains in ordinary to King William III.; and in 1696 took the degree of D. D. at Cambridge, and assisted his friend Gravins in preparing an edition of Callimachus. The Hon. Charles Boyle (afterward earl of Ossory) published a new edition of the "Epistles of Phalaris," early in 1695, and complained in his preface of some alleged want of courtesy on the part of Bentley, respecting the loan of a manuscript in the king's library. Bentley courteously assured Boyle that his statement was erroneous, and expected the complaint or accusation to be cancelled or retracted. Neither course was adopted, and, after a lapse of two years, Bentley was called on, in compliance with a promise made to his learned friend, William Wotton, the linguist, of Oxford—made long before Mr. Boyle had even commenced his labors—to make a public statement of the grounds on which he concluded the "Epistles of Phalaris" to be spurious. This appeared in an appendix to the second edition of Wotton's "Reflections on Ancient and Modern Learning," nor, as he had entered into the discussion, did he spare keen critical censure on Mr. Boyle's own labors. The leading scholars of Oxford, headed by Atterbury, united in a reply to Bentley, which was published in 1698, with the name of Charles Boyle on the title-page. Pope, Swift, and Gay brought lighter weapons into the field. General opinion set in strongly against Bentley, who was disliked for the arrogance of his knowledge; but, after a pause, there was issued that immortal dissertation (*immortalis dissertatio* are the words of Porson), in which Bentley disposed of the question at once and forever, with a mighty array of erudition, and showed that the "Epistles" were written by a sophist, who had assumed the name of Phalaris; that the epistles ascribed to Themistocles, Socrates, Euripides, and others, were not genuine; and that the fables attributed to Æsop were the productions of various minds, at various times. To this dissertation a rejoinder was promised, but never appeared. Early in 1700, at the age

of 38, Dr. Bentley received that main preferment which was at once his reward and his scourge for the rest of his life. By the gift of the crown, he was made master of Trinity college, Cambridge, an office of large emolument, great dignity, much power, and vast responsibility. In January, 1701, he married Joanna, daughter of Sir John Bernard, a baronet in Huntingdonshire. In the same year he was made archdeacon of Ely. As actual head of the university of Cambridge, he introduced many necessary reforms, put the university press on a better footing than before, encouraged scholars and scholarship, improved the discipline of his college, also improved the modes of examination for scholarships and fellowships, and extended the college library. Many abuses which he reformed were supported by the fellows of his college, from whose society he kept aloof, and his general conduct, even when morally and legally correct, was arbitrary. In 1709, the vice-master of Trinity and some of the senior fellows accused him of mal-appropriation of the college funds. Out of this arose a litigation (one of the *causes célèbres* of literature), in which Bentley, supported somewhat by the junior fellows, but most strongly by his own determination, boldness, and adroitness, succeeded in keeping his office 4 years after sentence of deprivation had been pronounced against him, and finally, at the end of nearly 80 years, saw the suit come to a natural death. In 1717, the regius professorship of divinity at Cambridge, by far the richest in Europe, became vacant. Bentley—notwithstanding the doubt whether, as master of Trinity, he could also hold that office—procured himself to be elected. His opening lecture treated of the text—1 John v. 7—on the three heavenly witnesses. He maintained the doctrine of the Trinity, but decidedly rejected the verse, of which he gave the history. As professor of divinity, one of his earliest administrative steps was, when George I. visited Cambridge, and several persons were nominated to the degree of D. D., to demand 4 guineas, in addition to the usual fees, before he would "create" them, as professor. For this, he was complained of to the vice-chancellor, and the result was, by a grace of the senate, passed by a majority of more than two to one, he was degraded and deprived of all his degrees, in Oct. 1718. He appealed to the law, and after more than 5 years' litigation, the court of king's bench issued a mandamus, compelling the university to reinstate him in every dignity, privilege, and right of which it had deprived him.—Amid all the litigious and troublesome years of Bentley's disputes with his college and with the university, he pursued his literary and scholastic labors as eagerly and perseveringly as if nothing else was on his mind. After his *coup d'essai* in literature (the appendix to the *Chronicle of Malelas*), he began to prepare editions of Philostratus, of Hesychius, and of the Latin poet, Manilius; but the Philostratus, though ready for the press, never

appeared, nor is it known what has become of it. In 1695 he assisted Evelyn in the revision of his *Numismata*. In 1696 he wrote the notes and made the emendations of the text of Callimachus. The first dissertation of Phalaris appeared in 1697, the second in 1699. He wrote in 1708 three critical epistles on the "Plutus" and the "Clouds" of Aristophanes, to assist his friend, Ludolf Kuster, in his edition of that poet. At various times he gave literary assistance to other learned men, and was mainly instrumental in engaging Professor Cotes to prepare a new and improved edition of Sir Isaac Newton's *Principia*. In 1710 he prepared emendations on 828 passages in the Fragments of Menander and Philemon, which had been edited, but with great ignorance of Greek, by the well-known Clericus, or Le Clerc. In 1711 he completed his edition of Horace—the most popular of all his publications. In 1718 he replied to Anthony Collins's "Discourse on Free Thinking." In 1716 he proposed, in a letter to Archbishop Wake, to restore the original text of the New Testament, exactly as it was at the time of the council of Nice—using the Vulgate to correct the Greek text, and out of all the variations obtain that which St. Jerome had authenticated as the reading authorized long before his day. The project was never proceeded with, though Bentley made extensive preparations for it, and even issued a prospectus (in 1720), to which was appended, as a specimen, the 22d chapter of the Revelations. In 1726 he published annotated and revised editions of Terence and Phædrus: it is said that "undoubtedly his Horace is by much the more elaborately learned; but with relation to the interests of his author, his Terence is the most complete." He subsequently became involved with Dr. Hare in a controversy on the metres of Terence, which made Sir Isaac Newton remark that "two dignified clergymen, instead of minding their duty, had been fighting about a play-book." Toward the close of 1731 he undertook his edition of "Paradise Lost," rapidly carried it on, and published it, with notes and corrections of the text, in January, 1732. His mistake was in undertaking such a work. It has some marks of ability; but, as a whole, is not worthy of his pen. In the same year, however, he redeemed himself. In 1726 he had noted and corrected the whole of Homer, chiefly with a view to the restoration of the digamma to its place and functions in the metre. In 1732 he seriously applied himself to complete this edition. It was never published, but the MS. was finally transmitted to Göttingen by Trinity college, for the use of Heyne, who, in his own edition of Homer, acknowledged the profoundest obligations to it, and made the world circumstantially acquainted with its merits. Bentley's edition of Manilius, published in 1739, when he was in his 78th year, had been prepared for the press 45 years before. Fourteen years after Bentley's death, Horace Walpole published, at his private press an edition

of Lucan, illustrated by the notes of Bentley, combined with those of Grotius. The suggestions of plausible conjectures for the emendation of the text are excellent. In 1740, after a happy union of 39 years, Bentley lost his wife. One of their daughters was the mother of Richard Cumberland, the dramatist. He had a presentiment, strong in his mind, that he would complete his 80th year, and exceeded that age by nearly 6 months, at his death in 1742.—As a public man, Bentley had an overweening opinion of his own dignity and rights, and a determination in upholding both, which opposition only increased. In private, though his manner was stately, if not severe, he is represented as being very amiable. It is scarcely too much to say that he was the best scholar England ever produced—the greatest of modern times, perhaps, if we except Salmasius. Parr, Porson, and others, unite in eulogizing his vast erudition. Dr. Johnson said that "he thought very highly of Bentley; that no man went so far in the kinds of learning that he cultivated." His life, by Dr. J. H. Monk, bishop of Gloucester and Bristol, is an elaborate production, leaning rather against Bentley, and published in 1880.

BENTLEY, WILLIAM, an American scholar and clergyman, born in Boston, in 1758, graduated at Harvard college in 1777, ordained pastor of a church in Salem in 1788, died Dec. 29, 1819. He was distinguished for his antiquarian learning, and collected a valuable and curious library and cabinet, which he bequeathed to the college at Meadville, Pa., and to the antiquarian society at Worcester. In theology he was regarded as a Unitarian, and he left several published sermons and discourses. He was for many years an editor of the "Essex Register," a democratic newspaper, wrote a history of Salem for the collections of the Massachusetts historical society, and after his death his eulogy was pronounced by Edward Everett.

BENTON, the name of counties in several of the United States. I. An eastern county of Alabama, bordering on Georgia, and embracing an area of 1,170 sq. m. The Coosa and the Tallapoosa are the chief rivers, beside which there are several small streams furnishing good water power. Chalybeate and other mineral springs are found in many places. Marble and limestone of good quality are obtained in abundance, and the ores, among which are gold, lead, and iron, are rich and plentiful. The surface is uneven, and in some places mountainous. Agriculture is in a very forward state, and, in 1850, the county produced 5,995 bales of cotton, 580,856 bushels of corn, 92,860 of sweet potatoes, and 69,452 of oats. There were 9 grist and flour mills, 7 saw-mills, 1 carding and fulling mill, 1 iron furnace, 1 newspaper establishment, and 25 churches. The public schools numbered 1,638 pupils. Value of live stock, \$388,410. Pop. 17,163, of whom 3,763 were slaves. Capital, Jacksonville. II. A north-western county of Arkansas, containing about 900 square miles. It is drained by Illinois

river and Flag creek, is generally level, and has a remarkably fertile soil. In 1854 the productions amounted to 248,780 bushels of corn, 81,812 of wheat, and 54,725 of oats. The strong tide of emigration which has been directed toward this part of the state, is rapidly augmenting the population and developing the resources of the country. Pop. in 1854, 5,495, of whom 195 were slaves. Capital, Bentonville. III. The old name of Hernando, a western county of the peninsula of Florida, bordering on the gulf of Mexico, and embracing an area of about 1,000 sq. m. It is a low, sandy tract, occupied in great part by swamps and pine forests. In 1850 it produced 28,515 bushels of corn, 86 hogsheads of sugar, 3,910 gallons of molasses, and 5,150 pounds of rice. There were 7 churches, and 60 pupils in the public schools. Value of live stock, \$65,840. Pop. 926; of whom 822 were slaves. Capital, Melendez. IV. A N. W. county of Tennessee, with an area of about 400 sq. m. It is bounded on the E. by the Tennessee river, and on the N. W. by the Big Sandy. The soil is good, and the agricultural products, in 1850, amounted to 305,490 bushels of Indian corn, 144,508 pounds of tobacco, and 48,802 of butter; value of live stock, \$151,611. There were 37 churches and 600 pupils in the public schools. Pop. 6,805, of whom 863 were slaves. Capital, Camden. V. A western county of Indiana, bordering on Illinois, watered by Pine and Sugar creeks, and having an area of 414 sq. m., most of which is occupied by fertile prairies. The surface presents few irregularities, and about  $\frac{1}{2}$  of it is covered with forests of oak, ash, sugar-maple, and walnut. The chief staples are wheat, maize, oats, pork, and cattle. The value of live stock, in 1850, was \$65,110, and the other productions amounted to 160,400 bushels of Indian corn, 2,612 of wheat, 14,808 of oats, 948 tons of hay, and 4,846 pounds of wool. There were 180 pupils attending public schools. Organized in 1840; capital, Oxford; pop. in 1850, 1,144. VI. A central county of Missouri, intersected by the Osage and its branches, the Pomme de Terre and Grand rivers, and by 2 or 3 small creeks, and comprising an area of 770 sq. m. The surface, which is somewhat uneven, is occupied by alternate tracts of fertile prairie and woodland. Lead is the most important mineral. The staples are grain, cattle, and pork. The value of live stock, in 1850, was \$177,054; the other productions amounted to 154,965 bushels of Indian corn, 11,072 of wheat, 39,415 of oats, and 12,502 pounds of wool. There were 4 tanneries, 1 saw-mill, 1 grist-mill, 1 newspaper office, and 5 churches. Capital, Warsaw. Pop. in 1856, 6,789, of whom 526 were slaves. VII. A central county of Iowa, recently formed, traversed by Cedar river, touched by Iowa river on its S. W. boundary, and having an area of 720 sq. m. The surface is undulating and occupied by prairies and woodlands, the former in larger proportion than the latter. The soil is very productive, and, in 1856, yielded 46,585

bushels of wheat, 49,815 of oats, 321,519 of Indian corn, 27,721 of potatoes, and 3,784 tons of hay. Capital, Vinton. Pop. in 1856, 6,247. VIII. An eastern county of Minnesota, bounded W. by the Mississippi, E. by Rum river; watered by the Flat, the Nokay, and the Elk, and having an area of 1,450 sq. m. The surface is uneven, and, in some places, covered with pine woods, and other timber. Lumber, Indian corn, potatoes, and hay, are the most important productions. In 1850, the county yielded 160 bushels of Indian corn, 3,650 of potatoes, and 1,121 tons of hay; value of live stock, \$11,925. Capital, Sauk Rapids. Pop. in 1857, 688. IX. A western county of Oregon, bordering on the Pacific ocean, bounded E. by Willamette river, and comprising an area of about 1,100 sq. m. The surface is mountainous, Mt. Snelling near the centre of the county being the highest elevation. Cape Foulweather is situated on the N. W. coast. The soil is fertile, well suited to agriculture and grazing, and produced in 1850, 14,913 bushels of wheat, 40 of Indian corn, 198 of oats, and 1,402 of potatoes. There were 1,856 pounds of wool raised, and 41,065 pounds of butter made. Value of live stock, \$195,891. Number of pupils attending schools, 40. Capital, Maysville. Pop. 814.

BENTON, a post village of Lafayette co., Wisconsin, situated 18 miles N. of Galena, in a region abounding in lead mines, which are extensively worked. In 1850, it had 2 churches, 5 stores, a smelting furnace, and about 800 inhabitants. Its growth has since been rapid, and by the census of 1855, had 2,218 inhabitants.

BENTON, THOMAS HART, an American statesman, born near Hillsborough, Orange co., N. C., March 14, 1782, died in Washington, April 10, 1858. His father died when he was 8 years old; his early education was imperfect; he was for some time at a grammar school, and afterward at Chapel Hill, the university of North Carolina, but finished no course of study there, as his mother removed to Tennessee to settle on a tract of land belonging to his father's estate. Thomas studied law, and soon rose to eminence in that profession. He was now elected to the legislature, serving only a single term, during which he procured the passage of a law reforming the judicial system, and of another giving to slaves the benefit of a jury trial, the same as white men. One of his earliest friends and patrons was Andrew Jackson, at that time a judge of the supreme court, and subsequently major-general of the state militia. Benton became his aide-de-camp, and during the war also raised a regiment of volunteers. It was from that service he derived the title of colonel, which has clung to him through life. Notwithstanding the close intimacy between Jackson and himself, which was of the most cordial and unreserved character, a rude and sudden rupture took place in which severe pistol and dagger wounds were given, and produced a rencounter that estranged them for many years. After the volunteers were disbanded Mr. Mad-

ison appointed Col. Benton, in 1818, a lieutenant-colonel in the army, but on his way to serve in Canada, in 1815, he heard the news of the peace and resigned. He now removed to Missouri, and took up his abode in the city of St. Louis. There he devoted himself anew to his profession. Soon, however, engaging in the politics of the day, he was led to the establishment of a newspaper entitled the "Missouri Inquirer." In this position he was involved in many disputes and contentions. Duels were usual at that time, and he had his share of them with their unhappy consequences. In one of them, which was forced upon him, he killed his opponent, Mr. Lucas—an event he deeply regretted, and all the private papers relating to which he has destroyed. His journal took a strong and vigorous stand in favor of the admission of Missouri, notwithstanding her slavery constitution, and when the angry controversy was terminated he was rewarded for his labors by being chosen one of the first senators from the new state. It is from this period, 1820, that his political history and the great influence he has exerted upon public affairs may be said to date. A man in the early prime of life, possessed of a commanding intellect, of large and liberal culture, an assiduous student, industrious, temperate, resolute, and endowed with a memory whose tenacity was marvellous, he soon placed himself in the front rank of those who shaped the councils of the nation. As a representative of the West with the manifold interests of a frontier population intrusted to his care, Col. Benton forthwith devoted himself to securing a reform in the land system of the general government. A pioneer himself in early life, he sympathized with the demands of that class, and his familiarity with the administration of government taught him how fallacious and suicidal was the policy of attempting to derive a revenue from such a source. The general distress which prevailed throughout the country in 1820, and which bore with especial hardship upon the land purchasers of the West, attracted attention to this subject, and afforded cause for the initiative which was taken by congress in liberalizing the system. A measure of relief devised by Mr. Crawford, secretary of the treasury, changing all future sales to the cash basis, reducing the price to \$1 25 per acre, and allowing a discount equal to the difference to former purchasers, afforded material relief. But this was not all that was needed. First, a preëemptive right to all actual settlers; secondly, a periodic reduction according to the time sections had been in market, so as to make the prices correspond with the quality; and thirdly, the donation of homesteads to impoverished but industrious persons who would cultivate the soil for a given period of years, and thereby develop the resources of the country—these were all points essential to the needed reform. Col. Benton apprehended the full scope of these changes, and determined to persist in urging them until they should be accomplished. The

years 1824, 1826, 1828, accordingly found him doing battle for such amelioration of the entire system. A bill embracing these features was moved by him and renewed annually until it at last took hold upon the public mind. At first his speeches attracted more attention throughout the country than in congress, for there his efforts were counteracted by schemes for dividing the public lands or the proceeds of their sales among the states. His firmness and position in the senate as a supporter of the administration of Jackson, gave him great weight with that party, and he was thus enabled so far to impress his views upon the president that they were embodied in one of his messages, and from that date the ultimate triumph of land reform became only a question of time. In his own state of Missouri, there were large quantities of saline and mineral lands which it had been the object of the general government to withdraw from sale and farm out. This injurious monopoly was also aimed at in his measures, and he succeeded in effecting a change which threw all open to occupancy. Intimately blended with the same subject, and moved by the same considerations, were the efforts which he began during the first term of his senatorial service, to effect a repeal of the imposts upon all necessities of life. These duties bore with great hardship upon the population of the valley of the Mississippi. It was a tribute levied upon them in part to sustain government and in part to protect special interests. In some cases this was most unequal as well as oppressive, and we may cite the salt tax as one that at that time met with more hostility than any other. During the session of 1829-'30, Col. Benton delivered the first elaborate argument against this burden upon a prime necessity, and afterward followed it up in such a manner as to effect its repeal. In directing adventure to explorations in the far west, in fixing the attention of government upon the early occupancy of the mouth of the Columbia, in encouraging overland transit from the Atlantic to the Pacific, Col. Benton was also prominent. He had previously devoted himself to these subjects and written largely upon them in 1819, and no sooner had he taken his seat in the senate than he made direct efforts to engage congress and the public in the great enterprise. From the researches of Clark and Rogers, from the suggestions of Jefferson, from reports of trappers and voyageurs, and from the courses of continental streams, he first elaborated the project of overland connection; and as science expanded, and knowledge of the intervening wilderness became more definite, his views took form in the proposals which are now so largely occupying public attention for a great central railway. The route urged by him as preferable to all others is through the passes of the Rocky mountains discovered by Fremont, known as the Cochetope, and debouching upon California through gaps in the Sierra Nevada. For many years he was the leading advocate and support in the senate of the whole scheme

of western exploration. It will thus be seen that Col. Benton became almost at the outset of his career the exponent of western interests, and though largely participating in all the great measures and political struggles that separated parties, he never neglected what was due to his own immediate constituency. The success which has already attended land reform, the establishment of preemption, the graduation of price, the donations to works of public improvement, all trace their origin to his continuous labors. In subordination to these leading objects, he likewise did much to open up and protect the trade with New Mexico, to encourage the establishment of military stations on the Missouri, and throughout the interior, to cultivate amicable relations with Indian tribes, and to favor the commerce of our inland seas that now bear such a wealth of freights. The marking out of post-roads, and securing appropriations for their maintenance, was especially a work of his own undertaking, and its benefit has been deeply felt in every branch of western trade. Upon the wider theatre of national politics the career of Col. Benton was equally remarkable. In the currency disputes which attended the expiration of the charter of the bank of the United States, the recharter afterward, and the final veto message of Jackson, Col. Benton addressed himself to a consideration of the whole question of finance, circulating medium, and exchange, and brought forward his propositions for a gold and silver currency as the true remedy for existing embarrassments, and the only rightful medium for government disbursements and receipts. Upon this subject he made many of the most elaborate speeches of his life, speeches that evince great research, a close study of finance, and a full knowledge of the evils that so often attend expanded paper issues. In Europe, as well as in America, his expositions attracted great attention, and extended widely his reputation as a debater, a thinker, and a practical statesman. At this time his manner of oratory was deliberate and unimpassioned, his matter full to overflowing with facts, figures, logical deduction, and historical illustration; but almost wholly devoid of that exuberance of wit and raciness of humor which characterize his later discourses. The elaboration which he gave to these views paved the way for subsequent legislation upon the national finance, and did much to consolidate the sentiment of the democratic party in favor of the sub-treasury system which was eventually adopted. It was from the financial policy which he thus enunciated, that he derived the sobriquet of "Old Bullion," which has never forsaken him, and which also he never forsook. Throughout the long and critical struggle between the administration of Jackson and the advocates of the recharter of the national bank, he was the main stay and support of the president in the senate, and acting in strictest unity with his party, held high place in their affection and confidence. The re-

cords of his labors in that behalf will be found upon almost every page of the debates of congress. As the mover of the "expunging resolutions," Col. Benton made himself especially obnoxious to his political opponents, but finally achieved success, and gained a great personal triumph. The motion was to strike from the journals of the senate a resolution of censure upon Gen. Jackson, and the passion of partisans clothed the contest with an importance at the time far greater than will attach to it in the future; but as an exhibition of many traits of Col. Benton's character, persistency, keen, sagacious insight, stubborn devotion to the fame of his party chief, unquailing courage, and confidence of success in the face of an adverse majority, no act of his life was more striking. During the succeeding administration of Mr. Van Buren, much of Col. Benton's time was devoted to the defence of the new financial policy, then being inaugurated. Upon the questions relating to the Oregon boundary, the annexation of Texas, and various other important matters growing out of our foreign relations between the presidential terms of Tyler and Taylor, Col. Benton took a leading and influential part. On the first of those he differed from the democratic administration of Mr. Polk, which had declared for the line of  $54^{\circ} 40'$ , but the powerful effort of Col. Benton, in which he reviewed the whole controversy, and elucidated the claims of the United States with much force, was not to be withstood, and the administration and party were content to acquiesce in his views, and accept the line of  $49^{\circ}$  as the northern boundary. During the Mexican war, also, his services, and intimate acquaintance with the Spanish provinces of the south, to whose history he had devoted much attention, proved most useful to the government. It was upon his suggestion that the policy of "masterly inactivity," at first determined upon by the president, was finally abandoned, and a vigorous prosecution of the war urged in its stead. His counsels were much sought also in regard to maturing a plan of campaign and conquest for compelling a peace, and at one time it was proposed by President Polk to confer upon him the title of lieutenant-general with full command of the war, in order that he might carry out his conceptions in person. The project, however, was never consummated. The bill creating the rank of lieutenant-general passed the house, but was defeated in the senate. The acquisition of Mexican territory brought on disputes in congress touching the question of slavery, which, after threatening the peace of the country, were adjusted by the compromise acts of 1850. Col. Benton opposed this compromise, offered by Mr. Clay, as being a vicious system of legislation, as fraudulent in regard to the Texas donation, and as defective and ill-judged in its clause in regard to the fugitive slave law. The acts, however, though defeated as a whole, passed separately.—In the violent rupture which had taken place between Gen. Jackson and Mr. Calhoun, and which made

its mark upon parties as well as persons, Col. Benton had warmly espoused the side of the former at the very outset. Shortly previous to that, the doctrine of nullification had first been broached at a dinner party in celebration of the birth-day of Mr. Jefferson, receiving an endorsement from Mr. Calhoun, and meeting with strong rebuke from Gen. Jackson. After the rupture, political antagonism heightened the animosity of the parties, and nullification assumed threatening proportions in the acrimonious disputes growing out of the tariff regulations. Col. Benton, in his close affiliation with the administration, became the leading democratic opponent of Mr. Calhoun upon this question in the senate, and the divergence which then manifested itself grew and widened as years progressed, and was the fruitful cause of a life-long hostility and opposition between them. The question, however, was arranged, but the compromise of 1833 proved to be only a lull in the storm. The same views in regard to state rights reappeared in the field of politics in connection with the far more complicated question of domestic slavery. This was manifested first in the conflict in the house of representatives in 1835, upon the discussion of abolition petitions, but the action of that body suppressed the cause of strife, and it was not until 1846-'7 that the same policy was renewed. The principles sought to be enforced were admitted to be identical with those of the first nullification movement; the causes assigned and the machinery for enforcement were different. Although representing a slave state, Col. Benton did not on account of the subject-matter involved deviate from the positions he had maintained on former occasions. At the earliest announcement of the new programme in the senate of the United States he stood forth to the attack. It was the beginning of a warfare that was eventually to prostrate himself at home, and drive him from the seat he had so long filled in the senate. On Feb. 19, 1847, Mr. Calhoun introduced a set of resolutions in the senate, declaring the doctrines he wished to insist upon in regard to the territorial powers of congress, the admission of states, and the use of common property, all bearing directly upon the slavery question, and the exciting issues that had been evoked by the proposed restriction known as the "Wilmot Proviso," which required the exclusion of slavery from all new territory to be acquired by the United States. They were immediately denounced by Col. Benton as "fire-brand resolutions." Mr. Calhoun expressed his surprise, stating he had expected the support of Col. Benton, as he was from a slave state. Col. Benton retorted that he had no right to expect such a thing. "Then," said Mr. Calhoun, "I shall know where to find the gentleman;" to which Col. Benton responded, "I shall be found in the right place—on the side of my country and the union." The resolutions never came to a vote, but they were sent to the legislature of every slave state, were

adopted by some of them, and became the basis of after-conflict and party organization. It was determined by their author to make them the grounds of instructions to senators in congress, and for this purpose they were sent to Missouri, and confided to the hands of democrats in the legislature unfriendly to Col. Benton's reelection. Without exciting inquiry, and under the sanction of leading members of the party whose fealty was not then suspected, they were passed in both branches and sent to Washington. Col. Benton no sooner received the instructions than he denounced them as not being expressive of the sense of the people, as containing disunion doctrines, and as designed to produce an eventual separation of the states. He announced that he would appeal from the legislature to the people, and immediately after the adjournment of congress returned to Missouri for that purpose. He began the canvass of the state, and prosecuted it in every section in a series of speeches, which for bitterness of denunciation, strength of exposition, and caustic wit, have scarcely their equal in the English language. The whig party of the state at first sustained his position, but finding a prospect of reaping a triumph of their own from the divisions of the democracy, they changed front, and affiliated with the "Anties," as the democratic opponents of Col. Benton were called. The result in 1849-'50 was the return of a legislature largely democratic, but composed of opposite wings, the Benton men being in the plurality. Many ballotings for senator were had without compromise; but a bargain was at length struck between whigs and anties, and 16 of those chosen by the people as democrats, but unfriendly to Col. Benton, voted for Henry S. Geyer, who was elected. Mr. Geyer was a whig, but had committed himself to the anti-Benton party in a letter prior to his election. Many of his party following his lead, they soon coalesced with the opposition democrats, and in after campaigns, by adroit management, they gained control of the state government. This was chiefly effected through the instrumentality of Mr. Sterling Price, who, although elected governor as a supporter of the views of Col. Benton, yet, after a pretended compromise of the two democratic wings, was no sooner sworn into office than he changed over to the opposition, carrying several of the other state officers along with him. To vindicate his position, and to break up the ascendancy which the so-called nullification party was thus acquiring, Col. Benton, in 1852, made a more direct appeal to the people in the congressional district in which he resided, announced himself a candidate for congress, and was elected over all opposition. In the session that followed he at first gave a warm support to the administration of President Pierce, but that soon falling under the control of the adherents of Mr. Calhoun, Col. Benton withdrew his support, and the administration in turn making a war upon him displaced from office all his

friends throughout Missouri. Soon the repeal of the Missouri compromise was mooted, and became a party measure in the shape of the Kansas-Nebraska bill. Against this Col. Benton exerted himself with all his strength, delivering a memorable speech in the house that did much to excite the country against the act, but failed to defeat its passage. The next election coming on in 1854, Col. Benton was defeated in his own district by a combination of his old opponents with the new American party that had just arisen, and Mr. Kennett was returned in his stead. Retiring from active politics, he then determined to devote his leisure to writings and study more congenial to his age; but was prevailed upon by his friends to suffer his name to be used as a candidate for governor of Missouri in the election of 1856. Once more laying aside the pen, and starting forth to canvass the state, he was received everywhere with enthusiastic applause. Immense masses of people gathered to hear him, his old political friends rallied to his standard, and his course became a triumphant procession. But a third list of candidates was in the field representing the American party, although most of its members sympathized with Col. Benton, and those who did not voted for his adversary instead of the candidate of their own party. Mr. Trusten Polk (national democrat) was thereby elected by a trifling plurality. The result of Col. Benton's canvass, however, was to restore, in a great measure, the conservative feeling of the state, and to prepare the way for a more liberal policy upon all domestic subjects. His friends up to the hour of election were sanguine of his success. He himself was never so, but felt himself fully repaid for all his toil by the impress he had made upon public opinion, and the reaction he had effected against disunion politics. In the presidential election of Nov. 1856, Col. Benton supported Mr. Buchanan in opposition to his own son-in-law, Col. Fremont. The reason assigned by him was a confidence that Mr. Buchanan, if elected, would restore the principles of the Jackson administration, and the apprehension that the success of Col. Fremont would engender sectional parties fatal to the permanence of the union. He soon after saw occasion to modify these opinions, and although in retirement, he was inclined to oppose the administration of Buchanan and to unite with the opposition that presented itself in the republican party. After his defeat in 1856, Col. Benton devoted his time again to literary pursuits. Even before that time he had begun his "Thirty Years' View" of the working of the government, of which the 1st volume was published in New York in 1854. It is a retrospect of the period during which he held a seat in the senate of the United States, and presents a connected narrative of the times from Adams to Pierce, developing much of the secret history of the men and politics of that epoch. No sooner was that off his hands than he engaged in the

still more laborious task of condensing, revising, and abridging the debates of congress from the foundation of the government to the present time. In this work, even at the advanced age of 76, his daily labors were almost incredible; it was finally completed down to the conclusion of the great compromise debate of 1850—in which, along with Clay, Calhoun, Webster, and Seward, he had himself borne a conspicuous part—upon his very deathbed, where he dictated and revised the final portions in whispers, after he had lost the ability to speak aloud. Some months previous to this, in an interval of leisure, he also wrote a review of the decision of the supreme court in the Dred Scott case, which attracted great attention. With a strong, industrious intellect, a dominating character, and quick appreciation of men, Col. Benton exercised a prominent influence upon national affairs. In Missouri his power was at one time boundless, and throughout the West he moulded public opinion to his will for many years. While adhering to strict party lines he was able to effect almost every thing he attempted, and often standing forth alone he drew his party with him against the policy of presidents and cabinets. In his last attempt of this kind, however, he failed, and was forced to relinquish office as a consequence; but this crowning struggle was a testimony to his independence and sense of duty that will contribute no less to his fame with posterity than the honors which he received through party allegiance.—Col. Benton was married, after becoming senator, to Elizabeth, daughter of Col. James McDowell, of Rockbridge co., Va. His surviving children are 4 daughters—Mrs. William Carey Jones, Mrs. Jessie Ann Fremont, Mrs. Sarah Benton Jacob, and Madame Susan Benton Boileau, now at Calcutta, wife of the French consul-general. Mrs. Benton died in 1854, having been struck with paralysis in 1844, and from the time of that calamity her husband was never known to go to any place of festivity or amusement.

BENTZEL-STERNAU, CHRISTIAN ERNST, count, a German author and statesman, born at Mentz, April 9, 1767, died in Switzerland, Aug. 18, 1850. He made a mark upon the literary world of Germany by his *Goldene Kalb* (Golden Calf), which appeared in 1803 and 1804, and to which he added *Der steinerne Gast*, *Der alte Adam*, satirical novels, full of humorous and philosophical delineations of men and things. He translated Young's "Night Thoughts," and Corneille's *Cid*; and for several years he edited the *Jason*. In 1806 he was at the head of the ministry of the interior, in Baden; in 1813, finance minister of what was then the grand duchy of Frankfort. In politics he was a liberal conservative. He became a convert to Protestantism, Aug. 19, 1827.

BENUA, with the prefix Orang, signifies, in the Malay archipelago, the aborigines of the Malay people. The term is applied chiefly to the wild mountaineers of the Malay penin-

sula, and to some of the semi-barbarous tribes to be found on the small islands in the straits of Malacca, and in the Rhio-Linga group. In some parts they are confounded with the Orang-Laut, and with the Bajau, or sea-gypsies, who are all of genuine Malay stock, and speak the language with the same purity as at Menancabow, the centre of Malayan civilization. The Orang-Benua are on land, what the Bajus are on sea—wandering vagabonds, subsisting upon the spontaneous productions of nature. They have been regarded by the civilized Malays as little superior to the orang-outang, the man-like ape of the Bornean and Sumatran forests; but since the establishment of the British free port of Singapore, and more especially since gutta-percha has become an important article of commerce—a tree gum, chiefly to be found in the almost inaccessible jungles, through which the Orang-Benua has roamed for ages, an unreclaimed savage—their habits and condition have greatly improved. All the gutta-percha exported from Singapore is collected by the hands of these Malay outcasts. "Nearly every man in the interior of Johore and Pahang," says Mr. Logan, in the "Journal of the Indian Archipelago," "is now engaged in searching for *taban* trees, from which the best gum is obtained; and this they exchange with Malay and Chinese traders, for articles of clothing, and for utensils and conveniences for habitations, to which they are attaching themselves; and they also begin to purchase implements for husbandry." There are many tribes of the Benua, called Jakun, Sakai, Sletar, Mintira, Sabimba, and Basisi, which are the names of rivers near which they are found.

BENZENBERG, JOHANN FRIEDRICH, a German astronomer, born May 5, 1777, at Schöller, near Elberfeld; died June 8, 1846. His most important work is *Ueber die Sternschnuppen* (Hamburg, 1839). He built an observatory, which he bequeathed to the city of Düsseldorf.

BENZOIC ACID, a product of the resin, benzoïn, obtained by distillation or precipitation, in the form of acicular crystals and pearly scales, of specific gravity 0.857. When pure it has no odor, but as usually prepared, containing resin and a little essential oil, it possesses the aromatic perfume of benzoïn. It is soluble in water, melts at 249°, sublimates in a current of air with a gentle heat. Benzoic acid also exists in all balsams (as these are defined in France), in vanilla, cinnamon, and the urine of infants, and that of the dog and of herbivorous quadrupeds. It may readily be obtained from that of the horse and of the cow. Its chemical composition is represented by the formula  $C_{10}H_8O_4 + HO$ . It forms, with alkalies and earthy and metallic oxides, salts called benzoates. It is used, combined with ammonia, in chemical analyses for precipitating sesqui-oxide of iron in neutral solutions.

BENZON (Malay, *kaminian*), gum-benjamin of commerce, an odorous resin extracted from the *styrac benzoïn*, a tree which attains a considera-

ble height, and is the peculiar product of Bencoolen, Batak, and Palembang territories, in Sumatra, and Brunai territory in Borneo. The tree is cultivated and raised from the small brown nut which it produces. When the plant has attained its fourth year, and its stem has a diameter of 8 inches, on the eastern coast of Sumatra, and 6 years, and 10 inches diameter, on the western coast, it begins to yield its best sap, which flows from the bark, and which is obtained by making an incision therein near the ground. That obtained during the first 2 years after tapping is of a creamy, or light saffron tint, and is soft and fragrant; for 2 or 8 years more, it produces an inferior quality, of reddish hue, and harder than the best; after this time, the sap ceases to flow, the tree is cut down, and a very inferior resin is obtained by scraping the inner surface of the bark and the stem. In the Batak country it is brought to the markets on the west coast of Sumatra in cakes, called *tampang*, of different weights, and these cakes constitute the chief currency of the Batak, who do not make use of coined money. The benzoïn obtained in Palembang territory is mainly collected by wild tribes, in the lowest state of civilization, the Kubu in the Rawas and Batang-Lekoh districts, and the Kumring further south. The Palembang resin is generally of an inferior quality, being mostly spontaneous exudations of wild trees, collected by these wild tribes. It is said of the Kubu, by Lieut. de Sturler of the Dutch E. I. army, that when Malay traders come to their country for benzoïn, they go to appointed places, beat a gong, deposit trinkets and pieces of colored cloth, and then retire; after a time, the timorous savages emerge cautiously from the recesses of the forest, take what has been left for them, and leave benzoïn in the place, which is generally more than an ample equivalent. This account is confirmed by recent travellers. There are no complete reports of the whole product of the resin in the archipelago. From the west coast of Sumatra, in 1855, was exported benzoïn of the value, in India markets, of 84,500 florins, about \$15,000. According to the Singapore price current, in 1857, it was worth, 1st quality, \$89 per picul (133 lbs.); 2d sort, \$45 to \$60; 3d sort, \$16 to \$20. The greater portion of this resin is made use of as an incense in Roman Catholic countries, and where the Greek church prevails, in the ceremonials of that religion. It is sometimes employed in medicine, being considered a valuable emetic and styptic; and still more in perfumery. The odor of the best resin somewhat resembles that of the vanilla bean. Being soluble in spirits, and not in water, it is erroneously called a gum. Its density varies according to quality, from 1.068 to 1.092. Beside benzoic acid, and a small quantity of essential oil, it contains 8 different kinds of resins, which have not yet been employed in the arts. It is used in several kinds of fine varnishes and lacquer work, on canes and snuff-boxes, which emit a

faint vanilla odor when warmed with the hand. Benzoin is supposed, by some writers, to be the malabathrum of the ancients. Pliny and Dioscorides describe it very accurately; and mention is made in the *Periplus of the Erythraean sea*, of malabathrum, an article of commerce on the Malabar coast, said to be brought from a country further east.

BENZOLE, named by the French chemist Pelouze, one of the highly carbonized products obtained by the distillation of coal tar. It was discovered by Prof. Faraday, in experimenting upon the oils condensed from oil gas. Mitscherlich afterward obtained it by distilling benzoic acid with hydrate of lime. It is also obtained by passing the vapor of benzoic acid through a red-hot iron tube. Various processes are given for preparing it in the large way. The material employed for producing it is the crude coal naphtha, that comes over in the first distillation of coal tar. This is rectified by distilling it several times from a metallic still, and subjecting the vapor at last to a low temperature (about 32° F.). Most of the other substances associated with it condense in the worm of the still at higher temperatures, and fall back into the still. The benzole is then purified by redistilling, at a heat between 176° and 194°, and by a new distillation freed from  $\frac{1}{4}$  of its volume of sulphuric acid. Filtering at a low temperature is also applied between the distillations, to remove any insoluble impurities. Benzole, when pure, is a clean fluid, like alcohol, without color, very volatile, possessing an ethereal odor, and of specific gravity 0.85. Its gravity, however, varies with the mode of its preparation, and it is stated that it is produced at the works at Oloversport, Ky., weighing only 6 pounds to the gallon, which is  $\frac{1}{4}$  the weight of water, or specific gravity 0.75. As prepared in England, by Mansfield, from the crude naphtha spirit obtained from coal-tar, it boils at 176° F. At 32° it ceases to evaporate, and solidifies in forms resembling white wax or camphor, and like these, will then burn without melting. Slowly cooled, when liquid, it takes beautiful forms of cruciform leaflets, which are perfectly transparent, and cluster together on each side of a central axis, like the leaflets of the fern upon its petiole. It will not mix with water, but is soluble in alcohol and ether. It has the solvent properties of these fluids, and is applicable to a great variety of useful purposes in chemistry and the arts. Its composition is 12 atoms of carbon and 6 of hydrogen— $C_{12}H_6$ ; but Dr. Muspratt and others, who give this formula, believe that it will prove to be a hydride of phenyl radical, thus expressed  $(C_6H_5)H$ . It may then properly be named hydro-benzide.—Numerous uses have been proposed for benzole; and, as the manufacture of it is now extensively entered upon in Manchester, Glasgow, and other large towns in Great Britain, and also in Kentucky, Ohio, Pennsylvania, and at Williamsburgh, near New York city, it is probable it will become an article of great im-

portance, particularly where alcohol, ether, and other alcoholic products are so costly as they are in Great Britain. But the most important use proposed is for illumination. It has been found that almost any gas, or even atmospheric air, passed through benzole, or some other equally volatile hydro-carbon, takes up a portion of its vapor, and acquires great illuminating power; that of coal gas passed over its surface is very much increased, and steam is thus rendered illuminating. The first suggestion of this use of benzole was by a man named Beel, of London, who took out a patent, about the year 1836, for forcing common air into a reservoir containing highly rectified coal naphtha (benzole), and burning the vapor carried along by the air at a burner near the reservoir. In this country, the subject was taken up about the year 1851, by different parties, the first machines in successful operation, of which we have any knowledge, being those of Mr. Oliver P. Drake, of Boston. A current of atmospheric air, by means of a simple bellows carried by clockwork, was forced through a mixture of benzole, alcohol, and water, and ignited at a gas burner. The flame was remarkable for its clearness and the intensity of the light, and resembled in color more the light of the sun than does any other artificial light. A difficulty was experienced in its use by the benzole ceasing to evaporate at a temperature approaching that of the boiling point of water, and the æri-form mixture, when conveyed through cold tubes, was liable to deposit a portion of its carbonaceous load, and produce a light of most uncertain brilliancy. At a high temperature, on the contrary, the benzole vapor was much more readily taken up, and produced a smoky light, so that it could not be used in very warm weather. To obviate this difficulty, several improvements have been introduced, and, by the use of benzole unmixed with other substances, and furnished by a regulating apparatus in suitable quantities, according to the temperature, the light has burned much more satisfactorily through the ordinary range of temperature to which it is ever likely to be exposed when protected from the weather without. Benzole of great purity is found to do better than the more common article formerly employed, and especially when introduced to the current of air diffused through porous diaphragms, and in a chamber admitting of the thorough mixture of the air and benzole vapor. Such is the apparatus now manufactured under the patents held by Mr. Jesse Carpenter. From the beauty, economy, and convenience of the light, it is an extremely desirable object to perfect the apparatus, that its use may be practicable at all temperatures. The demand it has created for benzole has caused the price of this to be advanced from 56 cents, at which it was formerly rated in England, to \$1.50 per gallon in this country. But the new works which have undertaken its manufacture, will no doubt cause its price to be reduced again. Still, at the higher

rate, it is found, according to a report made in Jan. 1856, by a committee appointed to examine into the merits of the light at the Utica mechanics' fair, that the cost of a light equivalent to that produced by a coal-gas burner, consuming 6 cubic feet per hour, is but 1½ cent per hour; while that of a coal-gas light, at the rate of \$8 50 per 1,000 feet, is 2½ cents per hour. The quantity of benzole equivalent to 1,000 feet of coal gas, is, however, variously estimated, probably from the different qualities of different manufacturers, and the different methods of testing it. The English authorities, in 1850, estimated that a gallon of the fluid possesses an illuminating power equal to about 1,000 cubic feet of gas. In this country, according to the experiments of Mr. Drake, this is regarded as too low an estimate, 3 gallons being required to produce this effect. In the small cost of transportation as well as in cleanliness in handling, benzole possesses great advantages. The pure article is a pleasant substance to use, having an agreeable odor; but much of the common benzole has a strong disagreeable smell of coal tar. Beside being used in the manner described, benzole may also be mixed to advantage with alcohol or with naphtha, for producing a fluid of great illuminating power, and very volatile, without involving danger of explosion.—The substances readily dissolved by benzole are stated to be various resins, mastic, camphor, wax, putty, fatty and essential oils, caoutchouc, and gutta serena. The solution with either of the two latter has the property of the collodion (or gun-cotton dissolved in ether), of quickly evaporating, and leaving a film like a thin membrane. In this way, it may be used as an application to cuts and burns. Shell-lac, copal, and gamboge are sparingly dissolved by it. It dissolves iodine, phosphorus, and sulphur, and when boiling takes up the last in large quantity, of which the greater part, however, when cooling, separates by crystallizing. Processes have been patented in England for its employment in removing paint, tar, oil, &c., from different fabrics, and from leather, wool, cotton waste, &c., and for cleaning gloves. Used thus in the large way, the benzole is distilled over and saved. No substance has been found so well adapted for removing the oil from the wool dyed, before it is spun into carpets, &c., at the mills in Yorkshire. The colors are not affected, while the greasy matters are entirely dissolved out. Treated with nitric acid it gives rise to a substance called nitro-benzole, which is used as a substitute for the oil of bitter almonds in perfumery.

BEOWULF, TALE OF, an Anglo-Saxon heroic poem, published in Saxon and English by J. M. Kemble, London, 1835, and later by Thorpe and by Wackerbarth. A metrical translation in German was produced by L. Ettmüller (Zurich, 1840). Leo says it is the oldest monument of German poesy in the Anglo-Saxon dialect, and of great interest in the history of the development of German literature. It is evidently of

continental and pagan origin, but, in the shape in which it has come down to us, it is partially but not entirely Christianized.

BÉRANGER, PIERRE JEAN DE, the most illustrious of French lyric poets, born in Paris, Aug. 19, 1780, died there July 16, 1857. His father, notwithstanding his pretensions to noble origin, was book-keeper to a grocer, and married a pretty young milliner, the daughter of an honest tailor, by the name of Champy, who kept a small shop in the rue Montorgueil. Here the future bard came into the world, which fact he afterward commemorated in one of his most sprightly songs, *Le Tailleur et la Fée*. He sprang thus from the people, and in spite of the particle *de*, which, owing to his father's prejudice, remained affixed to his patronymic, he never missed an opportunity of proclaiming his plebeian birth; *Je suis vilain, et très vilain*, is the burden of one of his earliest effusions. After being put to nurse for 8 years, he was brought back to his grandfather's, where he lived for more than 6 years, little cared for by his mother, and entirely neglected by his father, while he was the pet of the old folks. In the beginning of 1789 he was sent to a school in the faubourg St. Antoine; and, from the roof of the house, he witnessed the taking of the Bastille by the people, which event made the deepest impression upon his youthful mind, as appears from a song, *Le 14 Juillet*, written 40 years later. His father, being unable any longer to pay his board at school, sent him, without previous notice, to a sister of his, a widow without children, who kept a small inn near Péronne, in Picardy. She at first hesitated to receive the unexpected guest; but soon, moved by sympathy and affection, she cried, pressing the child to her bosom: "Poor forlorn being, I will be your mother." And she most faithfully kept her word. Under the guidance of this worthy woman, whose mind was far above her humble station, the young Pierre was brought up in a somewhat irregular way; but received lessons intended to make him a good man, and a thorough republican. This last character was singularly enhanced in him by the practical training he was submitted to, at a school established by M. Ballue de Bellanglise, formerly a member of the legislative assembly, and, according to Béranger himself, a sort of republican Fénelon, and a true philanthropist. In this school the boys were formed into a kind of democratic association, electing their own officers, as mayor, councillors, justices of the peace. They debated political questions; on important occasions, speeches were publicly delivered by the young politicians, and more than once they sent up addresses to the convention, and to Robespierre. Béranger distinguished himself among his young colleagues as a clear and cogent speaker; so much so that the good Ballue used to prognosticate that the boy would at some future day "make his mark." Patriotism, which, as he says, was the great, if not the only passion of his life, was already burning in the heart of the

boy, and he feelingly narrates his emotions when hearing of the victories or the reverses of the French armies. But the time had come when it was necessary for him to learn a trade; consequently, through the advice of his good friend, M. Ballue, he entered the printing office of Lainez, a bookseller, who evinced great kindness toward his apprentice. The latter did not acquire marked proficiency as a printer, but showed an inclination to poetry, making at that time some rough attempts at rhyme. Toward the end of 1796, the young printer was called back to Paris by his father, who was then engaged in all sorts of stock-jobbing and financiering speculations, as well as in Bourbon conspiracies. A large amount of the money made by his exertions was spent in these conspiracies, from which he was known as the "banker of the royalists." Young Béranger became the assistant of his father; and however repugnant the business was to his feelings and opinions, he evinced so much tact and ability that, according to his father, he was sure to become "a great banker." Unhappily, in 1798, the firm failed; and, although reduced to very straitened circumstances, the young man found himself greatly relieved. "My poverty," he says, "was not barren of pleasure. I lived in an attic on the boulevard St. Martin, and the most magnificent sight opened before my eyes. I had no money, no hope, no prospect of fortune, it is true; but I was free from all the trouble and disgust connected with the business I had been engaged in against my taste and feelings. To live alone and make verses at my ease, I considered to be true happiness." Friendship and love also contributed to embellish his life; and, as far as his slender means would allow, he heartily joined in popular amusements. Graceful remembrances of that time are to be traced in several of his liveliest pieces, such as *Le grenier* and *Mon habit*. This careless life lasted several years, during which he sketched many projects of great works, and wrote poems which were never destined to be brought to light, among the number a pastoral poem, *Le pélerinage*, an epic, *Olovis*, and several comedies, two of which were five-act plays. Meanwhile he had seen the revolution of the 18th Brumaire, which he applauded, like the majority of France, and had been on the point of being killed in the rue St. Nicolas, by the infernal machine, directed against the first consul. Although he did not witness with indifference the great changes which were taking place in his country, his interest was especially concentrated in his poetical performances; but, unfortunately, the scanty pittance upon which he depended, was constantly diminishing, and at the end of 1808 penury stared him in the face; his gold watch and other valuables, relics of better times, had been pawned long ago; his clothing was in the poorest condition, and none of his friends was well enough off to offer him relief. In this extremity he wrote a letter to Lucien Bonaparte, brother of the first consul, sending him, as specimens of

his literary attainments, two poems, *Le réta blissement du culte* and *Le déluge*. He had scarcely any hope in the success of this last shift; so we may imagine his joy, when a very kind answer invited him to an interview. Borrowing a dress appropriate for such a visit, he repaired to his new protector. Lucien, whose interest had been awakened by the letter, was much pleased with the young man, gave him advice and encouragement, and relieved his wants by resigning to him his pension as a member of the French institute. This, being an annual income of a little less than \$200, was a fortune to the destitute young poet. The next year, 1806, he was engaged by the painter Landon to write the notices for the *Annales du musée*, an illustrated publication, giving outline engravings of the great paintings in the Louvre gallery. This added for 2 years \$350 to his annual income, and enabled him to help his father and secure a degree of comfort for his old grandmother, who had been entirely ruined. This was indeed a bright epoch in the life of our poet, who more eagerly than ever devoted himself to his poetical pursuits. In 1809, being introduced to Fontanes, the grand master of the imperial university, by his friend Arnault, he was appointed to an office worth about \$200; which salary was gradually increased to \$400. Béranger's life now began to take a more regular shape, and his talent to flow in its proper channel. He had occasionally written songs, mostly of a gay turn, as they were designed to enliven his joyous meetings with his friends whom he visited at Péronne; but however successful in his attempts, he was not conscious that this was his true calling, and would ultimately secure him durable fame. Now, however, he paid more attention to lyrical poetry, and felt that it might possibly be treated in such a manner as to take rank among the most creditable branches of literature. Some of the pieces which he wrote during the following years, being circulated in manuscript, created a sensation—*Le sénateur*, *Le petit homme gris*, *Les guenais*, and *Le roi d'Yvetot*, among the number. This success procured for him the acquaintance of Désangiers, the well-known song writer of the time, and a very kind-hearted man, who took a decided fancy for his young competitor, and prevailed upon him to become a member of the celebrated club, *Le caveau*, which had been reestablished about 1811. Henceforth his fame increased rapidly; his gay satires, and even the licentious strains in which he indulged, according to the custom of his contemporaries, were received with applause, and gave him a rank among the most renowned lyricists. The disasters of 1814 and 1815, the 2 invasions of France by European armies especially, fell like a bitter pang on the patriotic heart of Béranger, and contributed to give a new and higher direction to his poetical vein; he felt that song could be made the medium of general feeling, and celebrate at once the glory and misfortunes of his beloved country. From that

time he became the truly popular or rather the truly national bard of France. The 1st volume of Béranger's songs was published in 1815, and eagerly sought for, although it contained very few political pieces. Its popularity, however, excited suspicion in the administrative department to which the poet belonged, and a friendly recommendation to stop such publications for the future was addressed to him by his chief. Béranger, who was now fairly launched on his new course, paid no attention to this notice, and went on to produce new pieces, which, like their predecessors, were extensively circulated by singing long before they were collected in book form. These were published in 1821, but previous to issuing the volume, Béranger left his office, to save the minister the trouble of discharging him. The sale was immense, and the songs resounded all over the country. Judicial proceedings directed against the poet, on account of his bold attacks upon the government, only added to his popularity and promoted the diffusion of the volume. Brought before the courts, he was sentenced to 8 months of imprisonment and a fine of 500 francs. This at once gave a more powerful impetus to his fame and to his inspiration: new songs issued from the gaol, and were repeated from one end of France to the other. Béranger, or rather his songs, had become a political power. A 3d volume, which appeared in 1825, though scarcely less bold than the preceding, was treated with more forbearance by the government; but the 4th, published in 1828, was severely dealt with; an imprisonment of 9 months, and a fine of 10,000 francs, was the penalty imposed on the song-maker, who was now proclaimed the greatest poet of the day. This was the most brilliant period of his career. Béranger had meanwhile secured great personal influence among the chiefs of the opposition party; his advice was sought for and respected; his known disinterestedness, his freedom of speech, which was always united with the utmost courtesy, his want of personal ambition, his generous disposition, his marked sympathy for young men, every thing contributed to endear him to all, and peculiarly to the inferior classes. Next to the memory of Napoleon I. no name enjoyed a greater popularity than that of Béranger. He was instrumental, at least through his songs, in the revolution of 1830. He afterward promoted the election of Louis Philippe as king, being convinced that France was not yet prepared for a republican government, but refused all appointments or rewards proffered by the king himself or his ministers. He desired to live as a true philosopher, contented with the little income secured by the sale of his songs; and desirous of preserving his personal independence. His 5th volume, published in 1838, affords evidence of his settled determination to be nothing but a song-maker; he did not even wish to continue a political adviser. Although he acted as if willing to be forgotten, there was no abatement in his popularity during the reign of Louis Philippe; and

when the revolution of February, 1848, broke out, the name of Béranger was still among the brightest in the eyes of the people. They sought him as their representative; and in spite of his decided refusal, they elected him to the constituent assembly; he had to send in his resignation twice before it was accepted. The last years of the national bard were passed in comparative retirement, amid a small circle of intimate friends; but the admiration which he inspired drew incessantly around him crowds of visitors, whom he could scarcely avoid by living as privately as possible in various villages or provincial towns. On the news of his last illness, the secluded street where he lived, in one of the most quiet parts of Paris, was filled up by the multitude, who were anxious to show their sympathy for him, and eagerly waited for hourly accounts of his health. His death threw a veil of sorrow not only over Paris, but over all France; and his funeral was attended by a host of mourners. Every one felt that France had lost a great poet and a great citizen. The songs published by Béranger during his lifetime have been reprinted under every possible form, and millions of copies have been circulated among all classes of Frenchmen. No poet could, however, so well have dispensed with the printing of his works without injuring his fame. His songs are familiar even to those who are unable to read. Beside his printed works, he left 92 songs written from 1834 to 1851, and a memoir of himself, both of which were published a few months after his death. The former cannot add to his poetical renown; but the latter, which is a perfect gem of autobiography, furnishes convincing evidence that in him simplicity, honesty, and goodness of heart, were united to genius. Partial translations or imitations of Béranger's songs have been published in England and in the United States. We must notice especially the version of 200 choice pieces by Mr. William Young, of New York.

BERAR, a large province of India, situated near the centre of the Deccan, and added to the British possessions in Dec. 1853. It lies partly in the territory of the Nizam, or Hyderabad, and partly in Nagpoor, extending from lat.  $17^{\circ} 48'$  to  $22^{\circ} 48'$  N., and from long.  $75^{\circ} 20'$  to  $82^{\circ} 48'$  E. Area, 56,728 sq. m.; pop. 2,550,000. It consists mainly of an elevated tract, bounded N. by the Sautpoora range, and surrounded by mountains which enclose it like a valley. It is watered by the Wurda, Wynegunga, Khahan, Taptee, and Mahanuddy. The soil is very fertile, and well suited to grain, tobacco, sugar, and cotton. The wheat is considered the best in India; it is ready for the harvest 3 months after it is sown, and leaves time for a crop of Indian corn. Agriculture is the chief occupation of the inhabitants, but is conducted in a rude manner, with inferior implements. Since the British have had possession of the country, however, there has been some improvement. There is no foreign and very little domestic

trade, the execrable state of the roads proving as severe a check to traffic as the heavy transit duties exacted by the native rulers. Sheep and cotton are transported to Kamsaum in the N. W. part of the province, and thence forwarded to Bombay, but quantities of cotton are lost on the way, and the few sheep which survive the hardships of the route are greatly reduced in flesh. A railroad to the W. coast and the removal of oppressive imposts are among the measures of reform promised by the British, and a belief is entertained that with the impulse thus given to industry, Berar will soon contribute largely to supplying cotton for the English market. The common people of this province are exceedingly illiterate. Only the children of the Bramins and merchants receive any education, and it is questionable whether the little they are taught is of much benefit to mind or morals. It is a rare thing for a farmer to know how to write his own name, and even the studies of the Bramins are usually confined to books of theology. —The ancient country of Berar, which was much more extensive than the modern province, was one of the 5 original independent kingdoms of the Deccan. In the 17th century it was annexed to the Mogul Empire, on the decline of which it was overrun by the Mahrattas and afterward divided between the Peshawar and the rajah of Nagpoor. The latter prince having joined with Dowlat Row Sindia against the British in 1808, was forced to cede to them the province of Outtack, together with Sumbulpoor and Patna, and to the Nizam some provinces on the frontier of Hyderabad. In 1817, Appah Sahib, the next rajah, took arms against the British, who accordingly deposed him, and governed the country from that time until 1826, in the name of Bajee Rao Booslah, then a minor. The country was given up to the young rajah on his coming of age, and on his dying without heirs in Dec. 1858, was added to the possessions of the East India company. The remainder of Berar, comprised in the dominions of the Nizam, is included in the territory recently assigned to the British for the support of the military force called the "Nizam's Contingent."

BÉRARD, FRÉDÉRIC, a French physician, born at Montpellier, Nov. 8, 1789, died April 16, 1828. When only 20 years of age, he wrote a thesis entitled "Theory of Natural Medicine, or Nature considered as the true Physician, and the Physician as an imitator of Nature." He afterward went to Paris, where he was engaged to write in the "Dictionary of Medical Science." In 1816 he returned to Montpellier as professor of therapeutics in a private course of lectures to the medical students of the college. At this period he published a work explanatory of the "Doctrines of the Medical School of Montpellier." Bérard returned to Paris in 1823, in the hope of obtaining a professorship at the school of medicine, but was not successful. With Dr. Rouzet, he published Dumas' work on "Chronic Diseases," with instructive commentaries, 2 vols. 8vo. In

1828 he also published in Paris his work on "The Relations of the Physical and the Moral Organism, as a Key to Metaphysics and the Physiology of Mind." In this work he explains his own views of human nature and the principles of life, in opposition to the views of Cabanis. He also took occasion to publish at the same time, a manuscript letter of Cabanis, on "Primary or Final Causes," accompanied by numerous annotations.

BÉRARD, PIERRE HONORÉ, a French surgeon and physiologist, born at Lichtenberg, in 1797. He pursued his studies unaided by fortune, and in 1831 was elected professor of physiology to the faculty of medicine of Paris, became dean of that faculty in 1848, and in 1852 was appointed by the president of the republic inspector-general of the medical schools, and entered into the new upper council of public instruction. He has published historical notices of Broussais and of Haller, has enlarged the 10th edition of Richerand's "Elements of Physiology," has begun the publication of a great work on physiology, and has made many reports to the academy of medicine. —Auguste, brother of the preceding, a French surgeon, born at Varrains, near Saumur, Aug. 2, 1802, died at Paris, Oct. 15, 1846. He studied at Paris under the guidance of his elder brother, Pierre, became professor of clinical surgery to the faculty of Paris, was one of the founders of the society of surgery, and a member of the academy of medicine, and wrote numerous professional treatises.

BERAT, or ARNAUT BELIGRAD, a town of Albania, on the river Beratino, the ancient Apsus; pop. 8,000. It is the seat of a pashalic and Greek archbishopric, and was taken by Ali Pasha from his rival Ibrahim. Amurath II. captured Berat, and his troops held it notwithstanding a desperate attempt by Scanderbeg with a strong body of Italian auxiliaries to retake it.

BERBERA, a trading place of Africa, on the southern shore of the gulf of Aden, in the territory of the Somaali, and directly south of the British settlement of Aden, in the southern part of Arabia. There are few permanent inhabitants in Berbera, on account of the hot monsoons, which blow from the last of May to August. It is simply a place for traffic from the interior. The yearly trade commences about Nov. 1, and continues to increase until March, and finally closes in May. The traffic is mostly in slaves, cattle, sheep, gold dust, hides, coffee, myrrh, benzoin, ostrich feathers, elephants' tusks, and gum arabic. The traders are principally from Harrar, a large settlement lying a little south of west from Berbera, and about 200 miles distant. The tribes surrounding Berbera, and nearer the coast, also visit it. The vessels trading to that port are from the southern parts of Arabia and from Hindostan, bringing cotton and silk goods, beads, wire, sugar, rice, copper, iron, and zinc. Berbera is a desert spot, and the country around for 10 miles back affords no pasturage for the cattle,

which must therefore be sold soon after their arrival at the port. The slaves are many of them captured from among the Christians of Shoa, in Abyssinia. The name of this town may perhaps be traced to the same etymological origin with Berber and Barabra, "dwellers of the desert."

**BERBERS.** In that portion of Africa known to moderns as the Barbary states, one rude wild clan stands alone, refusing to join the *mêlée* that has long ago obliterated nearly every mark of nationality among those who have been its subjects. They have given their name to the Barbary states, and impressed their character on their history. The origin of the name Berbers has been the subject of much conjecture. Some Arabian writers have derived it from the Arabian word "Bar" (desert); others from "Beberna" (murmuring), as descriptive of the sound of the North African language. Others still say that Ber was the son of one of the shepherd kings of Egypt, and that from him comes the name "Berbers;" while others affirm that Ber was a descendant of Madzigh, who was the progenitor of the whole race. Consequently, the Berbers call themselves Amazirghs; they do not know the name Berbers. However the question of the origin of the term may be settled, it leaves the origin of the tribe itself still open. In regard to this, opinions are quite as various. The most probable conclusion is that they came originally from the land of Canaan. This opinion is supported by tradition, by monumental remains, and by history. The Berbers themselves have a tradition that they came from Canaan; and some of the Arabians say that the Berbers are a colony of Philistines, and others that they were Amalekites driven out by Joshua. Procopius asserts the same origin for them. He says that 2 marble columns were at Tanger in his time, with inscriptions in Phœnician: "We fly from the robber, Joshua, the son of Nun." And it is certain that the Jews who had settled in Spain before A. D. 694, called the Jews who had settled across the straits, in Barbary, "Philistines." By this they doubtless meant to say that their brethren, settling in North Africa, had thus mingled with Philistines (whom tradition had so long assigned to that locality). The Berbers are, without much doubt, a remnant of the discomfited Canaanites. If it appears strange that they should have wandered so far, it is to be remembered that the country was not altogether unknown to them. They lived on the borders of the Mediterranean. They must fly or be exterminated. Northward they could not fly, for there lay the invading force in the heights of Ajalon and Michmash. Eastward they would not, for they were dwellers by the sea. Southward, they must keep the sea-coast, or plunge into the deserts of Arabia. This would take them to Egypt; but Egypt was a powerful and thickly settled kingdom. To the nomadic Philistines Egypt would give neither contentment nor food. Moreover, it is the opinion of able

writers, that the Philistines were the Hyksos of Egyptian history, whom Thothmes had expelled scarcely 2 centuries before, and the remembrance and hatred of whose tyranny had not yet died away in Egypt. But beyond, in Cyrenica, and Numidia, and Mauritania, a fertile soil, a climate like their own, a location by the sea, and, above all, a country precisely adapted by its mountains and plains for nomadic life, invited them. To this day, they have preserved the same nomadic habits which characterized the ancient Philistines. They inhabit the back country, in the northern and western valleys and slopes of the Atlas, while the mongrel descendants of a dozen nations crowd the coast. On the southern slopes of the Atlas live an equally distinct tribe, known as the Shelloohs. The Shelloohs consider themselves as the aboriginal inhabitants, and say that the Berbers are interlopers, who emigrated from the east. The Berbers occupy thus precisely the topographical attitude they should occupy as immigrants, who would naturally follow the shore, and drive back the original occupants of the territory, around and beyond the mountains, where the Shelloohs now are. The Berbers and Shelloohs are constant marauders upon each other, and date this hostility back to an early time. The only argument against this account of the origin of the Berbers is found in philology. The Berber language seems to resemble the Shellooh, and neither of them appears to have any Semitic affinities, whereas the Philistines were a Semitic branch. In accordance with this philological phenomenon, Messrs. Nott and Gliddon, in the "Indigenous Races," set down the Shelloohs and Berbers as Hamitic and cognate. But in all mental and physical peculiarities, they do not present affinities that would justify the blending of their national origin. The Shelloohs are of frail structure, dark complexion, easily civilized, humane, and peaceable; the Berbers are robust, of light color, stubbornly savage, cruel, and warlike. In every outward respect, they are as antipodal as the Berbers and Arabs. In whichever direction the truth may lie, the Berbers are an interesting race. Rude, warlike, and nomadic, they have come down almost unchanged through more than half the course of human history.

**BERBICE**, a district of the colony of British Guiana, settled by the Dutch in 1626, between lat. 6° and 7° N., and long. 57° and 58° W. It was 8 times captured by the British, on the last occasion in 1808, in whose hands it has since remained. In 1831, Demerara, Essequibo, and Berbice were consolidated into British Guiana. The capital of Berbice was New Amsterdam. It stands on the E. bank of the Berbice river, which flows into the Atlantic, and is navigable for 165 miles from the sea for vessels drawing 7 feet of water. Vessels of 300 tons can only sail as far as Fort Nassau, 50 miles from the river's mouth. On this river, Sir R. Schomburgk first saw, in 1837, the gigantic water-lily, called *Victoria regia*. The last

census of Berbice was in 1851; pop. 27,008, of whom 19,831 were natives, 4,547 African immigrants, 820 whites. Since the emancipation of the slaves, many negroes have become free proprietors. The principal products are rice, cotton, sugar, rum, vanilla, maize, balsam, and timber. The land is flat, exceedingly woody, and only cultivated near the river. The climate is deadly for European constitutions. In 1844, the total value of exports was £226,218, of which £222,859 went to Great Britain. Total imports, later statistics, £65,640. In the same year 86 vessels, about 12,000 tons burden, entered, and 72 vessels with nearly the same tonnage cleared. The registered shipping was 18 vessels with a burden of 854 tons. The later statistics of this district are included in those of British Guiana.

BERBIGUIER, CHARLES ALEXANDRE VINCENT, a French student of demonology, born at Carpentras, department of Vaucluse, 1776, died Dec. 8, 1851, of a sickly constitution, attributed "the ills which flesh is heir to," as well as the troubles inflicted upon him personally, by a lawsuit, and the injudicious treatment of the physician to whom he submitted his case, all to evil spirits, sent by the prince of demons to assail his Christian virtues. This conviction became so fixed in his mind that he went through a thorough course of studies in demonology, which brought him to the conclusion that the evil spirits in question belonged to the family of fairies. He published a work in support of his conclusion, *Les Furfadets, ou tous les démons ne sont pas de l'autre monde*, illustrated with plates (Paris, 1821, 8 vols. 8vo). The author ruined himself in this expensive publication, and died in a mad-house.

BERCHET, GIOVANNI, an Italian poet and prose writer, born at Milan, about the year 1790, was a friend of Manzoni and Silvio Pellico. In 1826 he became a frequent contributor to a liberal journal at Milan, called the *Conciliatore*. When this journal was finally suppressed and its contributors cast into prison or exiled by the Austrian government, Berchet settled in Geneva. A collection of his patriotic poems was published in a small volume at Paris, in 1841.

BERCHET, PIERRE, a historical painter, born in France, 1659, died in London, 1720. He went to England in 1681, and was sent by William III. to decorate a palace at Loo, in Holland. He afterward painted the ceiling of Trinity college, Oxford, and the staircase at the duke of Schomberg's in Pall-Mall, and the summer house at Ranelagh.

BERCHTESGADEN, a district in the circle of Upper Bavaria; pop. 9,200. It is an Alpine county, with Swiss-like scenery. The Watzmann and the Höhe Göhl are the highest peaks. Its main industrial feature is the production of salt. In the royal mines 200 miners are employed, and the annual produce is 16,000 cwt. of rock salt. This district and its chief town of the same name are also famous for their manufactures of wood, bone, and ivory work.

BERCHTOLD, LEOPOLD, Count, a German philanthropist and traveller, born in Moravia, 1738, died in 1809. He acquired 8 different languages, and traversed Europe, Asia, and Africa, in order to gain knowledge which should enable him to diminish the sum of human misery. He studied in Turkey the means of warding off and curing the plague; he propagated vaccination in countries where the practice had not yet been introduced. At his own cost, he erected and endowed various charitable institutions at Prague and Brünn, and saved the people of Riesengebirge in 1805 from famine by collecting contributions for their aid, and importing corn from abroad for their free use. After the battle of Wagram, Count Berchtold threw open his chateau for the use of the sick and the wounded. He was cut off by a fever incurred in the wards of this temporary hospital.

BERDIANSK, a city in the government of Taurida, in European Russia, on the sea of Azof, at the mouth of the river Berdianska; pop. 6,000. Its port is one of the best in that sea, and is of special value for the commerce of the city of Kertsch, and for the exports of grain from the Nogai-Tartars. This is principally in wheat, linseed, rape seed, hemp, butter, hides, and wool. In the vicinity of Berdiansk there are coal mines and salt lakes.

BERDITOHEV, or BERDYCHEV, a city in the government of Volhynia in European Russia; ill built, with several churches and cloisters, and 20,000 population, mostly Polish Jews. It is celebrated in that region for its fair held for 4 weeks from the 15th of August, to which almost all the nobles and seigneurs gather with their families, often encamping in the open field. The traffic at this fair amounts sometimes to \$4,000,000. The nobles also take this opportunity to transact their own private affairs, such as lending, but above all borrowing money from the Jews, paying rents and interest, selling and buying landed estates, or renting them, hiring overseers and other servants. Such fairs and gatherings in Polish, or Russo-Polish towns, are the harvest seasons of the Jews, who, as bankers, brokers, go-betweens, advisers, confidential men, surround the Polish nobles, peasants, and hirelings of whatever kind, and, in fact, direct their actions.

BERENDS, JULIUS, a Prussian democrat, born in Kyritz, April 30, 1817; studied theology, but a radical sermon of his, printed in 1844, lost him the license to preach, or to teach school. He then set up as a printer at Berlin. In 1848 he was elected to the Prussian constituent assembly, and held an influential political position through the subsequent events, till the reestablishment of the old order of things caused him to return to private life.

BERENGARIUS (BERENGUER), an ecclesiastic who played a conspicuous part in the 11th century, as an opponent of the doctrine of transubstantiation, supposed to have been born at Tours, in 998, and to have died there in 1038. It is cer-

tain that he resided there during the greater part of his life, and held a canonry in the church of St. Martin, though he was at the same time archdeacon of Angers. His contemporaries, Guilmund and Berthold, describe him as a man of shallow intellect and little erudition, whose chief dialectic weapons were the use of terms in a novel signification, and the employment of opprobrious epithets. It is difficult to discover precisely what was his doctrine of the eucharist, although it is certain that he denied transubstantiation. He commenced his attack on this dogma in 1045, and was supported at first by several bishops, the chief of whom were Bishop Bruno of Angers, and Bishop Frollant of Senlis, as well as by a still larger number of the inferior clergy and students. It seems also that Philip the Fair, king of France, countenanced him for a time, from political reasons, as the learned Gfrörer labors to prove. These bishops abandoned him, however, at a later period, and all political countenance was withdrawn from him, so that he failed in establishing a numerous and permanent party. The opinion of Berengarius, together with that of John Scotus Erigena, whom he professed to follow, was first condemned by a council at Rome. A public dispute which he held with 2 monks of Bec, before William of Normandy, ended also in an unfavorable manner for him. Soon after (1060), 2 synods were held, the first at Vercelli, the second at Paris, to both of which he was invited, and where, on his failing to appear, his doctrine was condemned. In 1054, a synod was held at Tours, by the papal legate, Hildebrand (afterward Gregory VII.), where Berengarius retracted his doctrine, and signed the formula of faith presented to him, without any attempt to defend himself. As he continued, however, to teach and propagate his doctrine, it was condemned again by Victor II., in 1055, by Nicholas II., and a synod of 118 bishops at Rome, in 1059, where Berengarius made a new retraction, by the French synods of Angers, Rouen, St. Maixent, and Poitiers, between 1062 and 1076; by 2 synods at Rome in 1078 and 1079, and finally by the synod of Bordeaux in 1080. At these last 3 synods, Berengarius renewed his recantation in the most precise language, but after each one, except the last, continued to teach his doctrine as before. After the last recantation, he certainly abstained from attacking the doctrine of the Roman church, and he is said to have died in her faith and communion, as related by William of Malmesbury. The remains of his works are to be found in the collections of D'Achery and Martenne, and in a more recent publication by Vischer (Berlin, 1884).

**BERENICE.** I. A city of Egypt, on the Red sea, whence a road, 258 miles in length, extended across the desert to Coptos, on the Nile. This road was constructed in the reign of the second Ptolemy. Berenice was one of the principal centres by which the trade of Egypt, under the Macedonian dynasty, and that of the Romans

subsequently, were carried on with the remote East. During the Roman period, a sum equal to \$2,000,000 is said to have been annually remitted to the East by the Roman merchants as payment for its precious products, which sold at Rome for a hundred-fold more than their original price. Nothing now remains of Berenice but a heap of ruins, adjoining the modern port of Habest. II. **BERENICE**, or Hesperis, a city of Cyrenaica, near which the ancients imagined the gardens of the Hesperides to be situated. A filthy, wretched village, named Bengazi, now occupies a portion of its site.

**BERENICE**, the name of several Egyptian and Syrian queens. I. A daughter of Lagos by Antigone, was originally the wife of Philip, an obscure Macedonian, but going to Egypt in the train of Eurydice, the bride of Ptolemy Soter, that monarch became enamored of her, and ultimately married her. Berenice was the mother of Ptolemy Philadelphus, and possessed such a hold on her husband's affections, that she prevailed on him to leave the kingdom to her own son, rather than to his issue by Eurydice. She had the reputation of being the wisest and most virtuous of the queens of Ptolemy. After her death, Ptolemy Philadelphus decreed her divine honors, and the poet Theocritus sang of her beauty, her goodness, and her apotheosis. II. A daughter of Ptolemy Philadelphus, married to Antiochus Theos, king of Syria. By his treaty with Philadelphus, 249 B. C., Antiochus was bound to put away Laodice, and to espouse in her stead the Egyptian princess. That monarch very reluctantly fulfilled this condition; but the moment he heard of the death of Philadelphus, he hastened to repudiate Berenice and to restore to her rights her injured rival. The indignant Laodice was not, however, appeased by this act of justice, and soon after caused Antiochus to be poisoned. Berenice now fled to Daphne with her infant son; but the partisans of Laodice pursued her thither, and having taken the city, murdered herself, her child, and all her Egyptian attendants. III. Daughter of Magas, king of Cyrene, betrothed to Ptolemy Euergetes. Magas died, however, before the nuptial ceremonies could take place, and his queen Arsinoë, who was averse to the marriage, offered her daughter and her kingdom to Demetrius, son of Demetrius Poliorcetes. Demetrius immediately accepted the offer, and embarked for Cyrene, but no sooner did he arrive than Arsinoë and himself became mutually enamored of each other. This so enraged Berenice that she appealed to the people, a party of whom rushed into the palace and murdered Demetrius in the very arms of the queen. After the consummation of this tragedy, Berenice proceeded to Egypt and became the spouse of Euergetes. When that monarch was setting out on his Syrian expedition, she cut off her ebony tresses, and dedicated them in the temple of the Zephyrian Venus for her husband's safe return. Before long, the hair mysteriously disappeared, whereon a court-

ly Samian exclaimed, that it had been translated to the skies, and metamorphosed into a constellation. This idea was taken up by some courtly astronomer of the age, who, in compliment to the queen, gave the name of *Coma Berenices* to the cluster of stars at the tail of the Lion. Berenice was assassinated in 221 B. C., by order of her son, Ptolemy Philopator. IV. Daughter of Ptolemy Lathyrus, ascended the throne of Egypt on the death of her father. She married Alexander II., the grandson of Ptolemy Physcon, whom the dictator Sylla had nominated king, but 19 days after her marriage she was murdered by her cruel husband, whom the indignant people almost immediately sacrificed. V. Daughter of Ptolemy Auletes, and eldest sister of the celebrated Cleopatra, was proclaimed queen by the Alexandrians after the expulsion of her father, 58 B. C. Her first husband was Seleucus Cybiosactes, brother of Antiochus Asiaticus, king of Syria; but his avarice and meanness so disgusted Berenice that she had him killed, and espoused Archelans, king of Comana in Cappadocia. In 6 months, however, Auletes was restored to his throne by the Romans, and Berenice and her consort were slain in battle. VI. Daughter of Costobarnus and Salome, sister of Herod the Great, was espoused to her cousin, Aristobulus, who, not treating his wife with sufficient deference, was put to death in the year 6 B. C. Berenice was next married to Theudion, maternal uncle to Antipater, the eldest son of Herod. She appears to have been again a widow when she went with her mother to Rome, where she died. VII. The eldest daughter of Agrippa I., married to her uncle, Herod, king of Chalcis, by whom she became the mother of 2 sons. After the death of Herod, A. D. 48, she repaired to the court of her brother, Agrippa II., and became his mistress. Next she was married to Polemon, king of Cilicia, but soon abandoned him and returned to Agrippa. In A. D. 62, she was with her brother at Casarea, when the apostle Paul pleaded his cause before him. In A. D. 65, while at Jerusalem, in fulfilment of a vow, she hazarded her life by interceding with the sanguinary Florus, for her oppressed countrymen, the Jews. At a subsequent period, she labored to dissuade her nation from that great rebellion which was attended with such calamitous results; but finding her efforts vain, she went over to the Romans with Agrippa, and thus escaped the ruin in which the rebels were involved. The most illustrious of the Romans were not proof against her arts and attractions. Her munificence gained her the friendship of Vespasian: her beauty and fascinating manners won the heart of Titus. Nor was the affection of the latter for Berenice a passing feeling. After the destruction of Jerusalem, she accompanied the conqueror to Rome, where his connection with her continued until the murmurs of the Romans compelled him to dismiss her. She then returned to Judæa, where she died.

BERESFORD, JAMES, an English author, born at Upham, in Hampshire, 1764, died Sept. 1840. He was educated at the charter-house and at Merton college, Oxford. Having received holy orders, he was appointed to the valuable rectory of Kibworth, Leicestershire. He wrote several separate works on various subjects, beside some excellent papers in the "Looker-on," a periodical of considerable interest, published in 1792-'3. The work which obtained for him great and permanent celebrity was the well-known humorous 'prose satire, "The Miseries of Human Life," in 2 vols. This has been repeatedly reprinted; it has even been dramatized, and numerous imitations of it have appeared.

BERESFORD, JAMES, late surgeon to the British forces, born in the island of Barbados, Jan. 8, 1788, died at Hartford, Conn., March 4, 1848. His family was one of the highest respectability in the island, and an English branch of the Irish house of that name. Dr. Beresford received his medical and surgical education in London, under Sir Astley Cooper, and in 1804, soon after receiving his diploma, entered the medical service of the British army, in which he passed through the various grades of professional rank to that of staff surgeon, which he received in 1815. His whole term of service was one of constant and arduous duty, and he was in every engagement in the West Indies which took place during that period; he was wounded at the last capture of Guadeloupe, while in discharge of his professional duties to his corps, the royal York rangers. In 1817, at his own earnest request, he was put on the half-pay list, and immediately entered on an extensive private practice in Barbice, S. America. Here he remained at the head of his profession till 1833, when, resigning all connection with the army, he removed to the United States, and settled in Hartford, where his eminent abilities soon gave him a large and valuable practice, to which his fine social qualities greatly contributed. Though maintaining the first rank in his profession, Dr. Beresford's life was too fully occupied to afford leisure for recording the results of his large experience.

BERESFORD, WILLIAM CARR, viscount, British general, born in Ireland, Oct. 2, 1768, died in Kent, Jan. 8, 1854. The illegitimate son of George, 1st marquis of Waterford, he entered the army at the age of 16, and served in Nova Scotia until 1790. During this period, he lost one of his eyes from an accidental shot by a brother officer. He served at Toulon, Corsica, the West Indies (under Abercromby), the East Indies, and Egypt, under Baird. On his return, in 1800, he was made colonel by brevet. He subsequently was employed in Ireland, at the conquest of the Cape of Good Hope, and (as brigadier-general) against Buenos Ayres, in 1806, where he was compelled to surrender, but finally escaped. In 1807 he commanded the forces which captured Madeira, and was

made governor of that island. In 1808 he became major-general, and, having arrived in Portugal with the English forces, was intrusted with the whole organization of the Portuguese army, including the militia. He was one of the commissioners for adjusting the terms of the celebrated convention of Cintra; was present during the retreat on, and battle of Corunna, where he covered the embarkation of Sir John Moore's troops; and, in March, 1809, was appointed marshal and generalissimo of the Portuguese army, soon raised by him into an excellent force, whether of attack or defence. He fought all through the Peninsular war, until its close in 1814, vigorously supporting Wellington. On the only considerable occasion, however, when he held the chief command, at the battle of Albuera, in 1811, he displayed very poor generalship, and the day would have been lost but for the act of a subaltern in disobedience of his orders. He took part in the victories of Salamanca, Vittoria, Bayonne, Orthes, and Toulouse. For these services he was created a field-marshal of Portugal, duke of Elvas, and marquis of Santo Campo. In 1810 he was chosen member of parliament for the county of Waterford (he never took his seat), and, in 1814, was created Baron Beresford of Albuera and Dungannon; in 1828 he was advanced to the dignity of viscount. In 1814 he went on a diplomatic mission to Brazil, where, in 1817, he repressed a conspiracy. On his return, he successively became lieutenant-general of the ordnance, general of the army, and (from 1828 to 1880) master-general of the ordnance. Having assisted Don Miguel, in 1828, he was deprived of his baton as field-marshal of Portugal. In politics, he was actively, though silently, a decided tory. His military efficiency chiefly consisted in his successful reorganization of the Portuguese troops, whom, by great skill and unwearied exertions, he finally rendered sufficiently firm and well disciplined to cope even with the French. In 1833 he married his cousin, Louisa, daughter of the archbishop of Tuam, and widow of Thomas Hope, the millionaire banker, and author of "Anastasius." He left no children, and the title became extinct at his death.

**BERESINA**, or **BEREZINA**, a river of Russian Poland, famous for a battle fought on its banks, and for the disastrous retreat of the grand army of Napoleon I., after the burning of Moscow. The Beresina has its sources in several small lakes, a little to the north of the town of Dockszyce, in lat. 55° 10' N., long. 27° 20' E. It has a course of about 280 miles, in a direct line, without allowance for the sinuosities of the current, which are very great and continuous, owing to the level nature of the country through which it flows, principally due southward, with an inclination to the eastward in its lower waters, which fall by 2 mouths into the Dnieper at Rezhitz. For the first hundred miles of its course, until it reaches a

village of its own name, a short distance below the town of Borissov, it flows through open morasses and swampy meadows; below that place its banks, still deep and miry, are encumbered with forests. In its upward march the army did not come upon this river; for, having entered the Russian territory by the passage of the Niemen at the town of Kovno, situated at the junction of the Vilna with that river, June 24, 1812, numbering 200,000 men, including 40,000 horse, of whom 12,000 were cuirassiers, it marched direct on Vilna; which was evacuated by the Russians and occupied by Napoleon on June 28. The object of this march was to fall directly on the great intrenched camp of the Russians, centrally situated at Drissa, on the confluence of a stream of the same name with the Dwina, which lies N. E. of Vilna, at a distance of about 150 miles, the route between the two places running to the northward of the sources of the Beresina. The Russians, however, having fallen back, in accordance with a preconcerted plan, upon Vitepsk, in the line of their retreat to Moscow, of which movement Napoleon was informed at Gloubokoje, directly north and about 80 miles distant from the head-waters of the Beresina, the French army marched, in pursuit of the enemy, due west upon Vitepsk, thus turning the river, which they were destined to cross a few months later under such altered circumstances, and leaving its waters entirely to the right of their advance. On Sept. 5 was fought the desperate battle of Borodino, at the close of which the French had not enough ammunition on hand to fight another general battle; on the 14th of that month, Napoleon entered Moscow, in triumph, only to see the greater part of the city reduced to ashes, by the fires kindled by the hands of the Russians themselves, between the 15th and 19th, when the act of self-devotion was complete, and the army of the invader already doomed to destruction. On the morning of Oct. 19, exactly one month after the voluntary destruction of the capital of old Russia, and 6 days after the first fall of snow—which, it may be well to observe here, was not extraordinarily early, any more than it was the true cause of the French retreat, as orders had already been issued, and partially acted upon, for the retreat of the hospitals, magazines, and parks of artillery, previous to the appearance of the first snow-flake—Napoleon evacuated Moscow, and the most disastrous retreat which all history has recorded was begun by the great captain, "who, then for the first time in his life, retired in the open field from an enemy." Strategetical reasons of sufficient weight compelled Napoleon to retreat on Smolensk, by the wasted and ruined line of Mohaisk, instead of by that of Kalooga and Medynsk, which, not having suffered by the transit of the contending armies, would have afforded partial supplies for his troops, which were from this moment utterly destitute of magazines and portable supplies. The end of

the Russians, in their unusual tactics and long retreat on Moscow, as well as in the wonderful act of patriotism which destroyed that famous city, now appeared to be fully gained. While the French were in rapid and disorderly retreat, famishing with hunger, perishing with cold, and unable to snatch a moment's precarious sleep among the whelming snow-drifts, without the certainty of being aroused by the wild yell and the avenging lances of the close-pursuing Cossacks, from every quarter of the empire, from the very opposite extremities of Europe, the Russian armies were closing in to the front, in order to intercept what was now almost a hopeless and despairing flight of a disorganized host—and would have been so altogether, but for the steady resolution with which the veterans of a hundred victories stood to their arms, and resumed both the semblance and the spirit of an army, whenever the Russian trumpets announced an attack on their decimated columns. Already it was predicted in the capitals of his enemies—and that was in every capital of Europe, unless it were that of little Saxony—that the great conqueror's career of conquest was already run, and that no choice was left to him, but that of a grave or a prison, for himself and for the remnant of his innumerable armies, in the sacred soil of Russia. But, in spite of all, the extraordinary genius of the man, the zeal and devotion with which he knew how to inspire his lieutenants, and the indomitable courage of his veterans, carried him through; and he was enabled to burst asunder the toils, and escape. Still, when the army arrived at Orsha, whence Napoleon had, at first, determined to force his way across the Oula in a direct line on Vilna, his position appeared indeed hopeless. At this juncture, just when he had discovered the formidable obstacles that would oppose him on the route to Vilna, which led through almost impenetrable swamps and forests, and had taken the direct road on the Beresina by Borissov, he received information that he was, in fact, all but surrounded. Minak, on the line of his intended march, from Borissov eastward, was taken; the bridge of Borissov seized, and the course of the Beresina defended in his front by Tchichagoff with 80,000 men; Wittgenstein was in an impregnable position on his right; and, on his left, Kutusoff, with the main Russian army. To oppose this concentration of forces, all that Napoleon could collect was not above 40,000 actual combatants, although, nominally, after his junction with Victor's, Oudinot's, and Dombrowsky's corps, he numbered 70,000 men, with a powerful artillery of 150 guns. On the morning of Nov. 28, the advanced guard of Tchichagoff, having crossed the bridge of Borissov, in order to open his communications with Wittgenstein, was encountered by Oudinot's vanguard; defeated with loss, and driven back across the bridge, which, however, it had the presence of mind to destroy; and, the river being filled with

masses of floating ice, it seemed, at least, questionable how Napoleon could hope to make his way across its flooded and encumbered waters. On the following morning the whole force of the grand army was drawn up on the heights of Borissov, determined to effect their passage at that point; but so skilfully did Napoleon contrive to mask his intentions, and to lead the enemy to believe that his real operations were directed on the lower Beresina, that Tchichagoff remained inactive, and Tchaplitz, who commanded on the western bank of the river, exactly in the teeth of the vanguard as they should cross over, was ordered down to resist the false attack on the lower part of the river. In the mean time, the western bank being thus cleared for a while, the French sappers rushed into the river shoulder deep to establish the bridges; Corbineau, with his cavalry, swam across the stream, and drove back the Russian detachments which were collecting on the further side; and before Tchaplitz returned from his fruitless excursion, the French vanguard was so firmly established on the left bank of the river, that there was no longer a hope to dislodge it. A second bridge was erected, and Oudinot's corps being pushed across with 50 pieces of artillery, drove back the Russians to the thickets at a distance from the river, and thus secured the important defiles leading to Zembin, and the line of the retreat of the army. Meanwhile, however, Tchichagoff, learning what was in progress, marched at once to the aid of Tchaplitz, and established a bridge of pontoons at Borissov, a little way above the French bridges at Studianka, by which he passed over, reinforced by Yermoloff with the van of Kutusoff's army, in order to assail the French advanced guard on the right bank of the river; while Wittgenstein, coming up in force, and having already cut off Partonneaux, with 7,000 men, and obliged him to lay down his arms, was preparing to attack Victor, who commanded the rear-guard on the left-hand bank, and to force him down headlong on the bridges and the river. On the night of Nov. 27, the Russian commanders all met, and concerted measures for a simultaneous attack on the following day, on both sides of the river. The morning of the 28th opened by a spirited Russian attack on Oudinot; but he had been reinforced by Ney's corps, by the imperial guard, and by a few squadrons of cuirassiers, who charged with such impetuosity, that they drove all before them, and, although the battle was reestablished, gained so much time that the retreat was made good, and the guards and Davoust's corps defiled off safely in the direction of Zembin, during the continuance of the action, which was maintained in the woods between Brill and Stackhow, with incredible fury, until midnight. It was, however, on Victor's devoted rear-guard, seriously jeopardized by the loss of Partonneaux's division, that fell the brunt of the storm. After a fearful struggle the Russian advanced artillery established a battery of 12 guns

on a spot which commanded the bridges; then an irretrievable confusion and hideous rout commenced, while, corps after corps, and battery after battery, the Russian forces advanced girdling in both combatants and fugitives with a circle of desolating fire, and thundering upon the bridges, crowded and choked with the helpless throngs, through whom the guns and caissons tore their way, like the car of Juggernaut, over masses of the dead and dying. At nightfall the artillery bridge broke down under the mingled effects of the pressure and the enemy's fire; and thousands were precipitated into the waves, and perished under the freezing waters, which in the following spring gave up their dead, to the number of 12,000 human corpses. In the mean time, just in the crisis of this agony, Victor's last corps forced its way up, and passing over and through the miserable relics, principally non-combatants, of the host, held the bridge firmly until the morning, when on the approach of the Russian troops it was set on fire as the last measure of defence. It is said that hundreds of the deserted wretches rushed over the burning timbers, and when the heat became too intense for endurance, plunged into the fearful river, where so many thousands of their comrades had already perished; and there found their graves, happier perhaps than the other miserable thousands, who, prisoners to the Muscovite, paid for their leader's ambition by the horrors of Siberian bondage. This was the last act of the grand but appalling drama of the Russian invasion. Out of above 500,000 men with 100,000 horses, and above 1,800 cannon, who had opened this terrific campaign, less than 50,000 combatants and non-combatants, scarcely preserving the semblance of an army, or the show of discipline, straggled, beyond the Beresina, in detached groups, along the road to Vilna. The price paid for the passage of those wretched survivors, was 12,000 dead, 16,000 prisoners, and 25 pieces of cannon; and yet, of those thus dearly rescued, but 20,000, not one-third of whom had seen the towers of the Kremlin, defiled across the bridge of Kovno, too glad to see the last of Russian territory.

**BEREZOV**, or **BEREZOVSK**, a village on a plateau, containing gold, in the government of Perm, Asiatic Russia, or Siberia, on the eastern side of the Ural mountains. Since 1754, gold has been dug here. The first Uralian gold washing was in 1814. Now the mines employ about 6,000 hands.

**BEREZOV**, or **BERESSEF**, a district in Asiatic Russia, in the government of Tobolsk. The population is composed of nomads, who use the reindeer, and of Ostiaks (a Finnic tribe), and Russians. The soil is frozen, and thaws in summer only about a foot deep.—A town of the same name, the capital of the district, is situated at the confluence of the rivers Soswa and Obi. It is the most northern place in western Siberia in which the horse can exist. Barley and rye are cultivated with success. Bere-

zov supplies Tobolsk with dried fish, and is the centre for the fur trade with the Ostiaks, the Voguls, and the Samoyeds. Three of the favorites of Peter the Great, banished by his successors, namely, Ostermann, Menchikoff, and Dolgoroukoff, ended their days there.

**BERG**, a portion of Rhenish Prussia, called also Cleve-Jülich Berg, containing the two districts of Cologne and Düsseldorf. In the time of the Romans Berg was populated by the Ubii. Under the Franks it was divided into 4 shires and belonged to the Ripuarii. Hermann, and his brother Adolf I., are the supposed progenitors of the counts of Berg. Eight Adolfs held the sovereign power in the duchy, until 1848, when it fell, through inheritance, into the hands of the counts of Jülich, who were promoted to the rank of dukes; but on the extinction of this family in 1609, Berg was tossed about from one German power to the other, until 1666, when it came into the possession of the Electoral Palatinate till 1801, and eventually, in 1806, became the property of Prussia. In 1808 Napoleon made a grand duchy of it, which he presented to Murat, who derived from it the title of grand duke of Berg, but exchanged it in 1808 for the kingdom of Naples, when Napoleon bestowed it upon the eldest son of his brother of Holland. However, before he reached his majority, Berg fell, in 1818, into the power of the allies, and in 1814, at the congress of Vienna, it was allotted to its present sovereign, the king of Prussia.

**BERG**, **FRIEDRICH VON**, count, Russian general of infantry, chief adjutant of the czar, and governor-general of Finland, born in Dorpat, May 27, 1790, sprung from one of the historical families of Livonia. He studied at the university of his native town, and entered the army in 1812, and at the end of the campaign in 1814, was captain in the general's staff of the guard. He now passed several years in Switzerland, Italy, Greece, and Turkey; and his travels, published on his return to St. Petersburg in 1819, attracted the attention of Alexander, who promoted him to the rank of colonel. In the following year he entered the diplomatic service, at the suggestion of Count Capo d'Istria, who then was secretary of foreign affairs, and passed some time at Munich and at Naples. In 1822 he was intrusted with the regulation of the affairs of the government of Orenburg and of its nomad tribes, and after 8 years of negotiation and warfare he succeeded in reconciling the refractory Cossacks of the Kirgheez steppes to the Russian administrative system. In Dec. 1824, he was engaged in a cruise against the pirates along the Asiatic shores of the Caspian sea, and his services were recognized by the emperor Nicholas, who promoted him to the rank of major-general. In 1826 he officiated as secretary to the Russian embassy at Constantinople until the outbreak of the war with Turkey, when he joined the army, and served in the campaigns of 1828 and 1829, under Wittgenstein and Diebitch, as quartermaster-general,

and took part in the Polish war of 1830; after which he remained for 12 years at Warsaw as lieutenant-general, occasionally employed on diplomatic missions to Berlin and Vienna. In 1843 he was appointed general of infantry and quartermaster-general of the entire Russian army, and removed to St. Petersburg, where he occupied, at the same time, the post of chief adjutant of the czar, and continued to act from time to time as diplomatist in Germany. After the outbreak of the revolutions of 1848 and 1849, he was sent on a mission to Austria, and when the eastern war broke out he was put in command of Revel and Esthonia, and subsequently of Finland. In 1849 the title of count was conferred upon him by the emperor Francis Joseph of Austria, and on Sept. 3, 1856, he was made a Russian count by Alexander II.

BERG, JENS CHRISTIAN, a Norwegian judge and statesman, born Sept. 28, 1775, whose name is connected with the principal events in Norway for almost the last century, and who took a conspicuous part, in 1816-'17, in the separation of Norway from Denmark. He was a member of the Norwegian bank administration in 1835, and delegate from the city of Christiania in 1837. He also distinguished himself in the sphere of Norwegian archaeology by his contributions on the subject to the Norwegian press.

BERGAMA, a town of Asiatic Turkey, 50 or 60 miles N. N. E. of Smyrna, and famous for the ruins of the ancient city of Pergamus, on the site of which the modern town is built. The remains of several temples, of a prytaneum, gymnasium, amphitheatre, and other public buildings, bear witness to the magnificence of the ancient city. Many of the buildings of the town are constructed on the sites of ancient edifices, and one of the mosques was, probably, in former times, a Christian church. In the graveyard, also, are many interesting memorials of antiquity. Pop. about 10,000.

BERGAMI, BARTOLOMEO. The celebrated trial of Queen Caroline, wife of George IV. of England, was principally founded upon a charge of adulterous intercourse with Bergami, who, in 1814, upon recommendation of the marquis Ghislieri, in whose and Gen. Pino's previous employment he had been, was attached to her household as courier, and subsequently promoted in Italy to the rank of baron, chamberlain, and master of the horse. Bergami, who had fought his way up in the Italian army from a common soldier to the rank of quarter-master, belonged to a respectable family, and the marquis Ghislieri described him to the queen as a person of character and attainments superior to his condition, and bespoke for him a kind treatment. This, and the personal advantages of Bergami, who was singularly good-looking, combining athletic strength and stature with almost feminine beauty, naturally disposed the queen in his favor. Moreover, he was full of loyalty and devotion, and on one occasion nearly

became the victim of poison which was intended for her. The queen not only showered favor after favor upon him, but also treated his whole family, especially a little child of his, with the greatest generosity and kindness. All these circumstances were used by her enemies as so many indications of her criminality, and during the trial one of the Italian witnesses, Teodore Majocchi, excited special indignation by his admitting every fact unfavorable to the queen, and by answering every question which might tell in her favor with *Non mi ricordo*. Bergami, who was at Pesaro during the trial, exclaimed, when he was apprised of her acquittal, but at the same time of her death, that she had been poisoned, and never could be convinced to the contrary. To the last he ever spoke of the queen with the greatest reverence and affection, and his deportment before and after her death led to the conclusion that he looked upon her rather as a benefactress than a mistress. However, wherever he went he became the observed of all observers. During his occasional excursions to Paris his apartments were crowded with visitors, consisting principally of ladies, who, under the pretext of having been friends of Queen Caroline, gratified their curiosity and obtained an interview with the portly courier. When at home he lived in great splendor; in the capitals of Italy, Rome, Naples, Milan, he was a lion, and the houses of "the best families" were open to him. The only persons who were the losers by the death of the queen were his servants, many of whom had been employed by that lady, who was always kind and considerate to all, while Bergami lived with a person of obscure birth, who was formerly a servant-girl, who had the superintendence of his house, and tyrannized over those below her as much as she could. At the time of the trial many different statements about Bergami's character were circulated in the house of lords, but however contradictory in many other respects, they all agreed in this one fact, that he was as inoffensive as he was good-looking a person, who probably would never have been heard of beyond the precincts of Italian barracks if it had not been for his relation with Queen Caroline, and for the peculiar construction which was put upon it by her enemies at the trial. His name in England was, by a curious mistake, spelt with a P.

BERGAMO, a province of the Austrian kingdom of Lombardy, pop. 340,000, bounded N. by the delegation of Valtelino, E. by those of Tyrol and Brescia, S. by Cremona, Lodi, and Crema, and W. by Milan and Como. It is divided into 18 districts, and these into 373 communes or parishes, contains 1 city, 22 market-towns, and 333 villages. The north, lying on the southern slope of the Rhaetian Alps, is very mountainous, and covered with wood, but in the south are rich meadow lands. The rearing of silk-worms is the principal branch of industry, but there are also woollen

manufactures. The Bergamasks speak the worst dialect of Italy, and are notorious for their cunning and the drollery of their manners.—The capital of this province, also named Bergamo, population 38,000, is built in the form of an amphitheatre, on the side of a rocky hill, with fortifications constructed by the most eminent architects of the 16th century, 15 churches, 12 monasteries, 10 nunneries, 4 hospitals, 6 orphan-houses, a lyceum, a school of painting and architecture, a musical academy, which produced Donizetti, and a seminary with a library of about 50,000 volumes. Its most remarkable building is the *Fiera*, containing 600 booths, in which a great annual fair is held in August, the value of the goods disposed of sometimes exceeding \$5,000,000,  $\frac{1}{4}$  of which consists of silks. The public square is adorned with a statue of Torquato Tasso, whose father, Bernardo, was a native of the town. Bergamo was known to the Romans, and was taken successively by Attila, the Lombards, and Charlemagne. In the 12th century, it suffered much from the quarrels between the Guelphs and Ghibellines, and it fell under the dominion of Venice in 1428. In 1509 it was conquered by Louis XII. of France, but retaken by the Venetians, in whose possession it remained until 1796, when it passed into the hands of the French. In 1814 it was incorporated into the Lombard-Venetian kingdom, under the sway of Austria, under which it reluctantly remains.

BERGAMOT, a kind of green-colored citron or small orange, of fine flavor and taste, of round form; the fruit of the *citrus margaritta* (*limetta* of Riiso and De Candolle). The rind furnishes by distillation an essence or oil which is much used in perfumery, and to some extent in medicine. The bergamot tree is a native of the south of Europe, and is particularly abundant in the neighborhood of Nice. To obtain  $2\frac{1}{2}$  ounces of oil, 100 bergamots are consumed. This oil or essence has a very agreeable, sweetish odor, and a bitter, aromatic taste. Its specific gravity is 0.885. In composition, it is not to be distinguished from oil of lemons. Alcohol is used to adulterate it, and is not readily detected when added only to the extent of 8 per cent.—Also the name of a variety of pears, which, like the citron-tree of the same name, is said to have originated in Bergamo, in Italy. There are at least 9 sub-varieties of the bergamot pear, all of which are highly esteemed.—The word is used again to designate a coarse quality of tapestry, supposed to have been invented at the same place in Italy already referred to.

BERGASSE, NICOLAS, a French lawyer, born in 1750, at Lyons, died May 28, 1832. He became conspicuous at Paris in the case of Kornmann against his wife, in which he had Beaumarchais among his opponents. His memorials in favor of his client had a success nearly equal to that won several years before by the witty dramatist in his struggle against La-

blache and Goezman; both mixed politics with their pleadings, and while thus courting public opinion, augmented that growing dissatisfaction with existing institutions which prepared the way for the revolution. In 1789 he was elected deputy to the states-general by the *tiers-état* of Lyons. He soon, however, became dissatisfied with the revolution, and retired to private life. He was arrested in 1794, but the 9th Thermidor saved him from the guillotine. He wrote on various political and philosophical subjects, but only his *Mémoires* against Beaumarchais are now remembered.

BERGEN, a north-eastern county of New Jersey, bordering on New York, and having an area of about 850 sq. miles. It is bounded on the E. by the Hudson river, on the W. bank of which, within the limits of this county, are the "palisades," a remarkable range of trap-rock rising perpendicularly from the river to a height of nearly 500 feet. It is intersected by Ramapo, Hackensack, and Saddle rivers, which afford valuable water power. The surface of the county is uneven, and in the western part mountainous. The soil, particularly near the rivers, is productive, and in 1850 yielded 150,709 bushels of corn, 57,686 of oats, 166,368 of potatoes, 16,582 tons of hay, and 328,759 pounds of butter. There were in operation during the same year, 1 manufactory of printed calicoes, 4 cotton, 1 woollen, 15 flour, 8 paper, and 15 saw-mills. The public schools contained 2,725 pupils. Limestone and magnetic iron ore are the chief minerals. The county was organized in 1710, and has since been much diminished by the formation of Passaic and Hudson counties. Pop. in 1855, 17,774. Capital, Hackensack.

BERGEN, or BERGEN'S-STIFT, a province and diocese in southern Norway, consisting of the *amt* or bailiwicks of *Nordre* and *Søndre* (north and south) *Bergenhuus*, and a part of the *amt* of *Romsdal*; pop. in 1855, S. *Bergenhuus*, 104,762; N. *Bergenhuus*, 81,496; total pop. of the province, 195,000.—The capital is Bergen, a fortified city and seaport; pop. in 1855, 25,797; built on a peninsula, at the head of a deep inlet, and has an excellent harbor; lat. 60° 24' N., long. 5° 18' E. The town forms an amphitheatre, and is surrounded by lofty hills on the land side; it has a cathedral, churches, hospitals, a theatre, museum, diocesan college, naval academy, charitable institutions, and 5 public libraries. It is the seat of a court of secondary jurisdiction, of one of the 8 treasuries of the kingdom, and of a branch of the Norwegian bank. The harbor is defended by several forts, and a naval squadron is usually stationed here. Bergen sends 4 representatives to the *storting* or legislature. The fisheries form the most important interest of the place, fleets of small vessels from the north bringing fish, blubber, roes, &c., in summer, to exchange for goods. Its exports are stock-fish, lobsters, herrings, cod-oil, horns, fish-roes, skins, iron, timber, and rock-moss. Bergen was founded in the 11th century, and for a long time was a

member of the Hanseatic league. It has lost much of the commercial importance which it enjoyed toward the close of the 16th century.

**BERGEN-OP-ZOOM**, a strongly fortified maritime town of the province of North Brabant, in Holland, situated on the river Zoom, near its confluence with the East Scheldt, 17 miles N. N. W. of Antwerp; pop. 7,000. The town is well built, with spacious squares, has a good harbor, 2 arsenals, earthenware manufactories, and some trade in anchovies. Its defences, deemed almost impregnable, are the *chef-d'œuvre* of the famous Coehorn, the rival of Vauban. It was besieged unsuccessfully by the prince of Parma, in 1588, and by the marquis of Spinola, in 1622. In 1747, the French, under Marshal Löwendal, took it by stratagem, and it was surrendered to Gen. Pichegru in 1795. Sir Thomas Graham attempted to carry it by a night attack, March 8, 1814, but was repulsed with the loss of two-thirds of his force.

**BERGERAC**, **SAVINIEN CYRANO DE**, a French writer and duellist, born in 1620, in Périgord, died at Paris, in 1655. He gained a brilliant reputation in his day, by his readiness to fight a duel, of which he passed safely through several hundred. A cough, a look, a tone of the voice, a gesture, was sufficient to superinduce a challenge from the pugnacious Bergerac. As his nose had been terribly hacked up in these *rencontres*, and as people could never refrain from smiling at sight of the battered and mangled feature, Bergerac was never at a loss for a quarrel. However, the sobering influence of years turned his energies into a new channel—that of philosophy, which he studied under Gassendi, in company with Molière, and wrote plays, from which later writers have drawn without acknowledgment.

**BERGHAUS**, **HEINRICH KARL WILHELM**, a German geographer, born at Clevea, May 8, 1797. He served as a volunteer in the war of liberation against the French, and entered France with the allies, which gave him the opportunity of making his first map, which was of France. In 1816 he became geographical engineer in the war department of the Prussian ministry. In 1824 he was appointed professor of mathematics to the Berlin academy of architecture; and in 1836, director of the royal school of geographical art in Potsdam. The first edition of his "Physical Atlas," in 90 maps, was published at Gotha, from 1838 to 1849; a second edition has since appeared. The 1st part depicts the meteorology and climatology of the world; the 2d, its hydrology and hydrography; the 3d, its geology; the 4th, its magnetic diversity; 5th, the geographical distribution of plants; 6th, the geographical distribution of animals; 7th, anthropology; 8th, ethnography. Prof. Johnston, of Edinburgh, has made this great work of Berghaus the basis of his "Physical Atlas." He brought out a German edition of George Catlin's original work, "North American Indian Portfolio," and an immense variety of geographical and

ethnographical works, of which we will enumerate only 2, the *Atlas von Asien*, in 18 maps, and the *Völker des Erdballs*.

**BERGHEM**, **NIKOLAAS**, a Dutch painter, born at Haarlem, in 1624, died Feb. 18, 1688. His father, Peter Klaas van Haarlem, a painter of still life, gave him his first instructions in the art, after which he studied under Van Goyen, Weenix, and other eminent masters, whose influence did not prevent him from forming a style of his own. His pictures are principally landscapes, with groups of figures and cattle, and are remarkable for effective composition, harmonious coloring, and admirable atmospheric effects, in which he was unsurpassed by any painter of his time, although the brothers Both, who employed similar subjects, were formidable rivals. He painted rapidly, but his pictures are beautifully finished, and command enormous prices at the present day. He also executed a number of admirable engravings and etchings with a nicety of finish unusual in a painter.

**BERGHOLTZ**, or **NEW BERGHOLTZ**, a village of Wheatland township, Niagara co., N. Y., about 15 miles N. of Buffalo. It was settled in 1848, by Lutheran emigrants from the Prussian town of the same name. Pop. about 2,000.

**BERGIER**, **NICOLAS SYLVESTRE**, a French priest and philosopher, born at Darnay, in Lorraine, Dec. 31, 1718, died in Paris, April 9, 1790. He was the author of numerous works, on a great variety of subjects, and filled various ecclesiastical offices. He began life as the curé of a little village of Franche-Comté, and was afterward made professor of theology, superior of the college of Besançon, and canon of the cathedral of Paris. He was member of the academy of inscriptions and belles-lettres, and an inveterate enemy of the encyclopædists.

**BERGMAN**, **TORBERN OLOF**, a Swedish chemist and naturalist, born at Catharineberg, in West Gottland, March 9, 1785, died at Medevi, July 8, 1784. Intended by his father for the law or the church, he was sent to the university of Upsal. There he devoted himself with such ardor to the study, not only of the languages but especially of mathematics and natural history, that his health became disordered, and he was obliged to retire for several months from the university. He passed the interval in the study of botany and entomology, and was now permitted by his parents to pursue that scientific career which accorded with his tastes and which the fame of Linnæus rendered attractive. He sent to Linnæus several insects previously unknown in Sweden, and devised a new method for their classification founded upon the characteristics of the larvæ. His first paper, published in the memoirs of the academy of Stockholm, in 1756, narrated the important discovery that leeches are oviparous, and that the substance called *coccus aquaticus* was the ovum of a species of leech containing several of the young animals. Linnæus wrote upon the memoir as he gave it his sanction, *Vidi, et obstupui*. Berg-

man devoted himself from this time to almost every branch of science, producing original results in every department of his studies. He presented memoirs to the academy upon attraction, electricity, twilight, the rainbow, and the aurora borealis; became in 1761 adjunct professor of physics and mathematics, at Upsal, and was appointed in the same year one of the astronomers to observe the first transit of the planet Venus over the sun. In 1758, an association of savants was formed for the purpose of advancing a knowledge of the earth; to each of the members a particular portion of the subject was assigned, and Bergman received the department of physics. The report which he made after 8 years of study displayed a masterly knowledge of chemistry and mineralogy, and was rapidly sold and translated into foreign languages. When, in 1766, a vacancy occurred in the chemical chair of the university, by the resignation of Waller, he was, by the favor of Prince Gustavus III., appointed to that position, and he immediately silenced the murmurs of his opponents by publishing a curious and original memoir on the manufacture of alum. From this time he devoted himself wholly to the study of chemistry. Accustomed to the rigid method of geometry, he determined to banish from chemical science all preconceptions, and to proceed only by observation of facts. This purpose he expressed in his discourse on the search for truth, in which he distinguished the Cartesian or contemplative method from the Newtonian or experimental, and preferred the latter. His first step was to furnish his laboratory with abundant materials and utensils for experiment, and to arrange around it a vast mineralogical collection. He published in 1774 a paper "On the Aërial Acid," subsequently called carbonic acid, and he proved by a variety of experiments that it was a new and distinct acid. By boiling nitric acid with sugar, gum, and other vegetable substances, he produced oxalic acid. By a skilful employment of unusual reagents he succeeded in analyzing mineral waters, and he formed factitious mineral waters by a combination of their elements. In his researches on this topic he adopted the opinion that caloric is a fluid like electricity, and was the first discoverer of sulphuretted hydrogen, which he called the hepatic gas. He was the first to employ the humid method in the examination of minerals, and by combining it with the dry method he obtained a knowledge of the principal elements of the emerald, topaz, sapphire, and other precious stones. He was the first also to derive important results in chemistry from the use of the blow-pipe. All of his labors led him to a chemical classification of the minerals, according to which the genera were determined by the principal integrant elements, the species by the different degrees in which they were combined, and the varieties by the external form. Applying geometry to the forms of crystals, he laid the foundation for the theory of crystallization afterward develop-

ed by Haüy. He demonstrated that the superiority of certain kinds of steel was due to the presence of manganese, and that the brittleness of steel in extreme cold was caused by siderite, a substance which he thought a new metal, although it has since been recognized as the phosphuret of iron. The theory of affinities, proposed by Geoffroy, in 1718, had been the first step toward giving a philosophical foundation to the science of chemistry. Bergman seizing upon this idea, made it almost his own by an immense number of new experiments, and presented chemical phenomena as only modifications of the great law which rules the universe. To the curious operations of the elements when placed in juxtaposition—2 united elements being separated by the approach of a 3d with which one of them combines, and 2 compounds as they meet each other inter-exchanging some of their elements and thus forming 2 new compounds—to these elementary movements, as if by power of instinct or of choice, he assigned the name elective, and introduced the term, which has since passed from chemistry into sentimental literature, of elective affinities. His mathematical training is seen in the simple formulas by which he described chemical operations. He adopted the erroneous though ingenious ideas of Scheele concerning phlogiston, and in general his discoveries of facts were of much more value than his theoretical explanations. His labors distinguished him throughout Europe; he corresponded with the principal contemporary chemists and physical philosophers, was a member of numerous learned societies, and received from the king of Sweden the order of Wasa. He remained at Upsal, though invited to Berlin by Frederic the Great, till the state of his health broken by his immense labors obliged him to repair to the mineral springs where he died.

BERGUES (Fr. *Bergues-St.-Winoc*), a strongly fortified town of France, department of Nord, 5 miles S. S. E. of Dunkirk, pop. 5,668. The surrounding country, which is low, can be inundated at pleasure, by means of works provided for the purpose. The most remarkable object in the town is an old tower, 160 feet high, probably of Spanish origin. Bergues is connected with the sea, at Dunkirk, by a canal navigable for vessels of 250 tons burden.

BERHAMPOOR, a town of Hindostan, presidency of Bengal, 6 miles south of the city of Moorsheadabad, on the river Bhagruttee. It contains extensive barracks for British troops.

BERINGTON, JOSEPH, an English Catholic author, born in the county of Shropshire, in 1744, died in Berkshire, Dec. 1, 1827. He was educated at the college of St. Omer, in France, and exercised sacerdotal functions in France for many years. His first work was "A Letter on Materialism, and Hartley's Theory of the Human Mind" (1776). About this time, the English Catholics found their position much stronger in the arena of public opinion, and began to think of appearing there openly. Bering-

ton, in 1779, published a letter to Fordyce, on his "Sermon against Popery." In 1780 appeared his "State and Behavior of English Catholics from the Reformation till 1780." In 1786 he came forward with "An Address to the Protestant Dissenters," who had lately petitioned for a repeal of the corporation and test acts. In 1787 appeared the "History of Abelard and Heloise," with their genuine letters, and "An Exposition of Roman Catholic Principles, in reference to God and the Country," and other pamphlets. In 1790, Berington gave to the world a "History of Henry II." (of England), vindicating the character of Becket from Lord Lyttleton's attacks. In 1798 appeared his "Memoirs of Gregorio Panzani," papal legate to England in 1634-'36, translated from the Italian. This publication displeased many of the author's own persuasion, who called in question the authenticity of the memoirs, but without success. In 1796 he published a tract in deprecation of using the device of pretended miracles as a means of rousing the Italian peasantry against the French. But his most important work appeared in 1814, a "Literary History of the Middle Ages," giving an account of the state of learning from "the close of the reign of Augustus to its revival in the 15th century."

BÉRIOT, CHARLES AUGUSTE DE, an eminent violinist, born at Louvain, in Belgium, Feb. 20, 1802. He early showed an aptitude for the violin, and in 1821 went to Paris to perfect himself in the performance of it, under Viotti, and other accomplished masters. Soon after, he performed in public, at the same time with Paganini, and at once took high rank as a violinist. Subsequently he made extensive professional tours over Europe, and on his return to his native country, received a pension from the king. In March, 1836, he married the celebrated singer, Malibran, who died suddenly 6 months afterward. From that time until 1842 he gave concerts, and in that year was appointed professor of the violin in the conservatoire of Paris. His style of playing is finished and classical; but as a composer, he is not much esteemed.

BERKELEY, a county in the N. E. corner of Virginia, on the Potomac, organized in 1772, and named after Gov. Berkeley; area, about 250 sq. m. Its surface is uneven and broken, and its soil stubborn and underlaid with lime-stone and slate, through which permeate numerous sulphur and chalybeate springs. The Baltimore and Ohio railroad passes through it. Live stock, wheat, Indian corn, and wool, are its principal products. In 1850 it yielded 856,384 bushels of wheat, 171,686 of Indian corn, 50,581 of oats, 6,667 tons of hay, and 157,850 pounds of butter. There were 50 mills of different kinds, a railroad machine shop, 4 tanneries, 80 churches, and 550 pupils attending public schools. In 1850, its real estate was valued at \$4,408,018; in 1856, at \$5,097,188, showing an increase of 15 per cent. Value of live stock in 1850,

\$366,140. Pop. in 1850, whites, 9,566; free colored, 249; slaves, 1,956; total, 11,771. Capital, Martinsburg.

BERKELEY, a market town and parish of Gloucestershire, England, situated about 1½ mile from the Severn, on one of its tributaries; pop. of the parish, 4,844. The town is built on an eminence in a rich valley, famous for its dairy products, particularly for its cheese. It has a handsome church, in which Dr. Jenner was buried, a grammar school, town hall, and market house. The Bristol and Gloucester railway passes through the place. It was a town of great wealth and importance at the time of the Norman conquest. The coal trade, formerly considerable, has fallen off of late years, and timber and malt are the articles chiefly dealt in. Berkeley castle, in which Edward II. was confined and murdered in 1327, stands on an eminence S. E. of the town. It is one of the finest specimens of an old feudal castle in the kingdom, being in a perfect state of preservation.

BERKELEY, GEORGE, an Irish prelate and philosopher, born at Kilcristin, in the county of Kilkenny, March 12, 1684, died at Oxford, Jan. 18, 1753. His father, William Berkeley, came of a family noted for its loyalty to Charles I., and was himself rewarded by the collectorship of Belfast. The son received his early education at Kilkenny school, was subsequently transferred to Trinity college, Dublin, and became fellow of that institution in 1707. About the same time, he published a mathematical tract, which attracted some notice, and this was followed, in 1709, by a much more important work, "An Essay toward a new Theory of Vision." In this he maintained the doctrine that the eye has no natural perception of space, and that all its perceptions of distance, size, and position, are derived from the sense of touch. This theory has been very generally adopted, although questioned by Sir David Brewster, one of the best authorities in modern science. Berkeley himself vindicated his theory in a pamphlet written 24 years after his essay was published; but this tract is not included in his published works. In 1710 appeared his work entitled, "A Treatise concerning the Principles of Human Knowledge," &c.; and in 1718, his "Dialogues between Hylas and Philonous." In these famous works, Berkeley denies the existence of matter, and argues that it is not without the mind, but within it, and that that which is generally called matter is only an impression produced by divine power on the mind, by means of invariable rules styled the laws of nature. These works gained many converts to Berkeley's theory, yet some writers insist that they contain the strongest arguments against revelation, when they were in fact really intended to combat the fallacies of the enemies of revealed religion. Beattie's opinion is that they have a sceptical tendency, and Hume expresses himself even more plainly, regarding them as the best weapons of scepticism to be found in

any author, ancient or modern. Nothing can be more plain, however, than that they were composed by one who placed implicit trust in revelation, and that no idea of their being used as arguments against it was entertained by the author. His writings brought him into notice with the distinguished men of his time, and being intimate with Swift, he formed the acquaintance of Pope, Arbuthnot, Prior, &c; and in 1718 he accompanied the earl of Peterborough to Italy, as chaplain and secretary of legation. He returned next year to England, but soon again set out with a Mr. Ashe, and on this tour paid his celebrated visit to Malebranche, the French philosopher, who became so excited in a discussion with Berkeley, on the recent theory of the non-existence of matter, that he, being ill at the time, was rendered worse, and died a few days afterward. Berkeley remained 4 years abroad with his pupil; he devoted much time to Sicily, and collected materials for an account of its natural history, which were unfortunately lost at sea. On his return to England he was most cordially received in learned circles, but was entirely dependent on his fellowship in Trinity college, until Mrs. Vanhomrigh, the celebrated Vanessa, bequeathed him £4,000 sterling. In 1724 he was made dean of Derry, the value of the living being £1,100 per annum. But worldly wealth had little value in Berkeley's estimation, and having formed the plan of establishing a college in the Bermudas, for the purpose of training pastors for the colonial churches, and missionaries to the Indians, he accordingly took a letter from Swift to Lord Carteret, who, after long delays, promised the aid of the government. It was in anticipation of the happy results of his scheme that Berkeley wrote his well-known stanzas, in which occurs the oft-quoted verse:

Westward the course of empire takes its way;  
The four first acts already past,  
A fifth shall close the drama with the day;  
Time's noblest offspring is the last.

He now, Aug. 1728, married the daughter of the Right Hon. John Forster, speaker of the Irish house of commons, and in the next month set sail for Rhode Island, where he arrived, in Newport harbor, after a tedious passage of 5 months, Jan. 23, 1729. The dean thus writes of his new residence: "This island is pleasantly laid out in hills and vales, and rising grounds; hath plenty of excellent springs and fine rivulets, and many delightful landscapes of rocks and promontories, and adjacent lands. The town of Newport contains about 6,000 souls, and is the most thriving place in all America for bigness." Soon after the dean's arrival, he bought a farm about three miles from Newport, and erected a house which is still standing; and many interesting reminiscences exist of his sojourn in the island, where his memory is fondly cherished. His family circle, including some of his wife's relatives, was a large one, and among the

number was Smibert, the painter, one of the earliest portrait artists who visited America. He painted a large picture of the dean and family (introducing himself into the group), which now hangs in the Trumbull gallery of Yale college. Not far from his house, and adjacent to the sea, lie the hanging rocks (so called), where, at their most elevated point, Berkeley found a natural alcove, roofed and open to the south, commanding a wide expanse of the ocean, and in it, tradition relates, he meditated and composed his "Alciphron, or Minute Philosopher." But the scheme for the college failed, the government aid promised by Carteret was never granted, and, after a residence of 2½ years, Berkeley returned to England, leaving his infant son buried in the yard of Trinity church, Newport, and giving to Yale college a library of 880 volumes, as well as his estate in Rhode Island, called Whitehall. In 1734 he received, as a special mark of favor from Queen Caroline, the bishopric of Cloyne. This place he held for nearly 20 years, dividing his time between the duties of his diocese, which he fulfilled in the most exemplary manner, and his literary labors. In the latter years of his life, he became rather subject to hypochondria, and, in hopes of benefiting himself, had recourse to tar water, which he was constantly drinking and recommending to his friends; even writing a treatise on its virtues. His works, written at this period, are, "The Analyst," directed principally against Halley and the other mathematical sceptics; "Queries proposed for the Good of Ireland;" a letter to the Roman Catholics during the rebellion of 1745; another to the Catholic clergy, entitled "A Word to the Wise;" "Siris, a Chain of Philosophical Reflections and Enquiries concerning the Virtues of Tar-water," and "Further Thoughts on Tar-water." In 1751, feeling himself infirm, and desiring to be near his son, who was about to enter Christ church, Oxford, he wished to resign his bishopric, which the king would not permit, but gave him leave to reside where he pleased. He removed to Oxford in July, 1752, and died there after a residence of only 6 months. So peaceful was his end, that his wife, who was reading to him one of Sherlock's sermons, was not aware of his having ceased to breathe, until some time after his family discovered that his limbs were already stiffened in death. Berkeley is not alone remembered for his works, but for a character of the most exalted Christian purity. Pope ascribed to him "every virtue under heaven;" and Atterbury wrote of him; "So much understanding, knowledge, innocence, and humility, I should have thought confined to angels, had I never seen this gentleman." In Trinity church, Newport, Rhode Island, where he often preached, is to be seen the organ he presented to the society after he became bishop; and to the sequestered home which he built, now occupied as a farm-house and sadly neglected, repair, from the throng of summer fashion, many who reverence the name of

Berkeley, and his mind of the rarest spiritual beauty.

**BERKELEY, GEORGE HENRY FREDERIC**, a British general, born July 6, 1785, died at Richmond, near London, 1857. He served in the Peninsular war and at the battle of Waterloo. His military abilities, in addition to his family connections, led to his gradual promotion to the rank of general, in 1854. From Feb. to Dec. 1852, he was surveyor-general of the ordnance under the earl of Derby's cabinet, and in the interest of the same party, he was afterward elected a member of parliament for Devonport.

**BERKELEY, SIR WILLIAM**, royal governor of Virginia for a portion of the reigns of Charles I. and II., and during the protectorate of Cromwell, was born in the vicinity of London, died at Twickenham, July 18, 1677. The date of his birth cannot be ascertained with accuracy, but from the rolls of the university of Oxford, it appears he was graduated M. A. in 1629, and immediately afterward he travelled on the continent, and returned to England "accomplished and learned." He was sent from England to Virginia as governor in 1641, succeeding Sir Thomas Wyatt, which position he maintained with a few brief interruptions until 1660. He connected his name inseparably with the colonial history, exhibiting great ability and zeal, and maintaining the royal authority when it had fallen everywhere else. When Cromwell sent a fleet to subdue the refractory planters, he was able to make terms, and after the death of "worthy Thomas Matthews," was elected governor by the people of Virginia without dissent. He remained at the head of affairs for a long time, and only lost popularity in consequence of his high-handed measures and severity toward the adherents of Nathaniel Bacon, after the death of that unfortunate leader. Many of these were put to death—among them Thomas Hansford, a planter of wealth and position, who was the first person judicially executed in Virginia. The conduct of Berkeley produced great dissatisfaction, and though under his rule suffrage had been made universal, the planters had influence enough to have him recalled, which was soon done, and he died in England before he was able to have an interview with the king. Charles II. is reported to have said on his arrival in England: "The old fool! he has shed more blood in his naked country, than I have taken for my father's murder." In his reply to commissioners sent to inquire into the colony, Berkeley said: "Thank God! there are no free schools nor printing presses, and I hope there will be none for a hundred years, for learning has brought disobedience, and heresy, and sects into the world, and printing has divulged these and other libels." Berkeley's elder brother, John, who had been placed by Charles II. in the house of peers, attributed his brother's death to mortification at the king's reception of the commissioners' report.

**BERKENHOUT, JOHN**, an English physi-

cian and naturalist, of Dutch descent, born at Leeds, 1780, died 1791. His father sent him to Berlin to study foreign languages, instead of which the young man entered the Prussian army, and left it, as captain, in 1786, when he returned to Edinburgh, where he studied medicine, and subsequently practised with success at Isleworth, in Middlesex. In 1778 he was employed on a mission to the American congress at Philadelphia, and his services were rewarded with a pension, which the English government granted him with the more readiness as he had suffered imprisonment upon a charge of a treasonable character, which was unfounded.

**BERKHAMSTEAD, GREAT**, a market-town of Hertfordshire, England, lying on the Grand Junction canal, and London and Birmingham railway, 28 miles N. W. of London. Pop. in 1851, 8,395. The town, which lies in a deep valley, is irregularly built, and contains a large church, a grammar school, a blue-coat school, gaol, house of correction, and the ruins of a strong castle in which Henry II. at one time resided, with his court. It is the birth-place of Cowper, the poet.

**BERKHEY, JAN LEFRANCOY VAN**, a Dutch naturalist and poet, born at Leyden, Jan. 28, 1729, died March 3, 1812. He was a skillful anatomist, and his "Natural History of Holland" obtained for him the professorship of natural history at the university of Leyden. His poems, though somewhat inflated, have considerable merit, especially one written in celebration of the 200th anniversary of the siege of his native city by the Spaniards, which received great applause when read before a numerous audience, Oct. 4, 1774. Attached to the Orange party, he was subjected to severe persecutions, and after the outbreak of 1807, his property was so reduced that he died in a state of comparative indigence.

**BERKS**, a south-eastern county of Pennsylvania, intersected by Schuylkill river, and drained by Tulpehocken, Maiden, Manatawny, and Little Swatara creeks. On its north-western boundary is a mountain range, called the Kittatinny, or Blue mountains; another chain, called here South mountain, but known in Virginia as the Blue Ridge, traverses the south-east central part, and between these two ranges lies the extensive and fertile Kittatinny valley, comprising the greater part of the county. The soil here is of limestone formation, and is carefully cultivated. The productions in 1850 amounted to 811,947 bushels of Indian corn, 577,668 of wheat, 880,769 of oats, 246,358 of potatoes, 83,257 tons of hay, and 1,873,294 pounds of butter. There were 168 flour and grist mills, 76 saw mills, and a large number of factories of various kinds. The county contained during the same year 102 churches, and 9 newspaper offices. The public schools numbered 14,156 pupils. There are a number of rich iron mines, which are industriously and profitably worked. Copper is found in small

quantities in connection with the iron. The exportation of the various productions of the county is facilitated by the Schuylkill and the Union canals, and by the Philadelphia and Reading railroad. Berks was settled by Germans in 1734. It was organized in 1752, and named from Berkshire, England. Area, 920 sq. m. Pop. in 1850, 77,129. Capital, Reading.

BERKSHIRE, a county of Massachusetts, area about 1,000 sq. m.; pop. in 1855, 52,791. It is at the western extremity of the state, extending across its entire breadth, and embracing a great variety of beautiful and picturesque scenery. The surface is diversified by mountains, hills, valleys, and rolling lands. In the northern part is Saddle mountain, the highest summit in Massachusetts. The soil is fertile and well watered by the Housatonic, Deerfield, Farmington, Hoosick, and several smaller rivers. Most of the land is devoted to grazing purposes. In 1850 the county produced 240,899 bushels of corn, 369,642 of potatoes, 92,460 tons of hay, 1,060,807 pounds of butter, and 2,575,145 of cheese. There were a number of cotton, woollen, paper, and other factories, 87 churches, 5 newspaper establishments, and 10,218 pupils attending public schools. Marble, iron, and limestone, are the principal minerals. Two railroads, connecting Albany, N. Y., with Boston and with Bridgeport, Conn., traverse this county, and 2 branch railroads are included within its limits. Berkshire was organized in 1770, and named from the county of the same name in England. Capital, Lenox.

BERKSHIRE, a central county of England, in the Oxford circuit, almost exclusively agricultural, and lying in the basin of the Thames; area, 752 sq. m.; pop. in 1851, 170,065. It is well watered by the Thames, the Kennet, the Loddon, the Ock, and the Auburn, with other smaller streams and rivulets. It is traversed by the Great Western railway, by means of which a direct communication is opened with London and the west of England, and by 2 navigable canals. The surface is undulating and well wooded. The climate of Berkshire is one of the healthiest in England. The soil is chalk and stiff clay, with a fine rich loam in the valleys. The land is well cultivated, the various improvements in agriculture being promptly tried and adopted. Small yeomen, with farms of 40 to 100 acres, are numerous in this county. The principal towns of Berkshire are Abingdon, Newbury, Reading, and Windsor. Reading is the shire town. The antiquities of Berkshire are not numerous. A cave called Wayland Smith's cave, in which a fairy smith once had a residence, has been converted into a barrow by antiquarian examination. There is a stone about 18 cubic feet in size, near a place called Kingstonisle, which, on being blown into through holes on the surface, emits a powerful sound that can be heard some miles off. The White Horse is a Saxon monument. It is a figure of a horse about 370 feet in length cut on the

side of a hill in the chalk. The turf which accumulates on the surface is cleared away every few years. The royal residence of Windsor is in Berkshire, and a great part of the ancient forest is also included in the county. Wallingford castle and Denniston castle are also places of interest.

BERLICHINGEN, Götz, or GOTTFRIED VON, one of the last of the feudal knights of Germany, whom the genius of Goethe has immortalized, in an early drama, founded upon the autobiography of Götz. He was born at Jaxthausen, in Würtemberg, in the latter part of the 15th century; died July 23, 1562. He was the contemporary of Maximilian I., the predecessor of Charles V. A bold, restless, and reckless warrior, he had lost his right hand in a battle, and supplying its place by an iron one, was thence called Götz of the Iron Hand. Having long carried on private war against the powerful lords, his neighbors, he at last took part with the peasants, in their bloody insurrection against the nobles; but less from any feeling of sympathy in their cause, than from personal motives, and hatred of the new order of civil life, which was then beginning to be enforced. In 1513 he declared war against the free city of Nuremberg, arrested the merchants returning from Leipsic, plundered their goods, and consigned many to the dungeons of his stronghold on the Jaxt. In the end, his numerous offences caused the emperor to lay him under the ban of the empire, and to impose a fine upon him of 14,000 florins. The fine was paid, and he was again restored to his civil rights; but refusing to desist from his turbulent practices, he was besieged in his castle by the imperial troops. He defended himself with stubborn valor, until he received a wound, from which he died. His autobiography was printed at Nuremberg in 1781, in 1776, and, for the third time, in Breslau in 1818. (See *Allgemeine Geschichte des grossen Bauernkriegs*, von Dr. W. Zimmermann, Stuttgart, 1841.)

BERLIN, the capital of Prussia, in the province of Brandenburg, is situated on the Spree, in a sandy plain, the largest of Germany, on a deep and still growing deposit of infusoria, 180 feet above the level of the sea. It is one of the largest and best built cities of Europe, is renowned for its university, and its scientific, literary, and artistic developments, and is a great industrial and commercial emporium. It originated in 2 cities, Berlin and Köln, and is divided into 11 precincts, namely: Old Berlin, Old and New Köln (on an island of the Spree), Louisenstadt (on the left bank), Friedrichstadt, Friedrichswerder, Dorotheenstadt, Friedrich-Wilhelmstadt, Spandauer and Stralauer Viertel, Königstadt, and the suburbs of Vogtland and Potsdamer-Vorstadt. It is surrounded by a nearly circular wall of 10½ miles long, with 17 gates, and 2 smaller gates, of which the Brandenburg gate is remarkable for its architectural beauty, and the statue of Victory driving 4 horses, the whole of copper,

which, in 1807, was removed by the French to Paris, whence the Prussians brought it back in 1814. The foundation of the original cities, whose names are of Slavonic descent, cannot be ascertained, but reaches back to the 12th century. Among the architectural monuments of the 18th century, the Klosterkirche, the Nicolaikirche, and Marienkirche, are masterpieces of art, particularly the first, and the third, with its tower 286 feet high. To a somewhat later period belong the Berlinische Rathhaus, the residence of the margraves and electors of Brandenburg, and the later royal residences in the Breite-Strasse and Post-Strasse. The present royal palace was begun in 1442, and was rebuilt after 1669. The city owes many improvements to the "Great Elector," Frederic William, who enlarged the population by a colony of French refugees, about the year 1680, and founded several of the new suburbs. He also founded the library, picture-gallery, and the museum of art, and many schools and churches. The armory, another masterpiece of art, was established in 1706, by his successor, the first king of Prussia, Frederic III., when Berlin had 50,000 inhabitants. After 1720, a great many Bohemian and Saltzburgian refugees, driven out on account of Protestantism, found an asylum in the newly built Friedrichstadt. The same king built a great many substantial and ornamental buildings. Under Frederic the Great even more was done for the city; the opera-house was built in 1742, the Catholic Hedwig church, an imitation of the Pantheon, in 1778, the university building in 1760, the cathedral, and the park called the Thiergarten. He demolished the fortifications of the city. He and his successor, Frederic William II., aided, by liberal encouragement, the ascendancy of Prussian and Berlin manufactures, of which the French refugees had laid the first foundation. In 1800, the city had already over 200,000 inhabitants. Since 1815, the architect Schinkel has enriched Berlin with a number of tasteful buildings, of which the Schauspielhaus, the Werdersche Kirche, the architectural school, and the splendid new museum, the finest building of the city, must be mentioned. The new opera-house, built on the site of the old one, burnt in 1843, is magnificent. Since that time, an abundance of palace-like edifices have sprung up. Among the statues in the public squares and places, the equestrian statue of Frederic the Great, by Rauch, erected in 1851, deserves mention; as does the equestrian statue of the great elector, on the elector's bridge; the 6 statues of the great generals of the 7 years' war (Schwerin, Seydlitz, Ziethen, Winterfeld, Keith, and the duke of Dessau) on the Wilhelmplatz; the statues of Bülow and Scharnhorst, near the Königswache; and the statue of Blücher, by Rauch, on the magnificent opera-place. The royal palace, with over 600 rooms and saloons, and several palaces of the princes, are remarkable. The streets are mostly straight, long, and regularly laid

out, the Linden-Strasse being the most splendid. The whole city is well lighted with gas, well paved, with granite sidewalks, and well provided with pleasure-grounds in the environs.—The city government consists of a major or burgomaster, of a deputy-major, and of 22 aldermen. The term of office of the major is 12 years, and that of the other magistrates 6 years. They are appointed by a municipal board, which is composed of 101 members, who are elected for 6 years by the permanent residents of the city. The yearly expenditure of the city is \$1,500,000. The population amounted, in 1850, to 405,000, in about 14,000 buildings (among which are 40 churches), and in 1855, to 426,602. Of these, 380,000 were Protestants, 10,000 Catholics, 10,000 Jews, and 5,200 so-called Christian Catholics, beside some thousands in minor sects. The original Slavonic inhabitants of Berlin, like those of the whole of Brandenburg, were in part exterminated, in part Germanized, in the 11th and 12th centuries. The native Berliners are renowned for their quick and sharp wit and dry humor, their literary and artistic tastes, their general intelligence, and passionate love of music. Scarcely any city in the world can rival Berlin in the number of its gifted natives, among whom Frederic the Great, the Great Elector, Mendelssohn-Bartholdy, the Humboldts, Heinsius, the German grammarian, L. Devrient, Wolff, the sculptor, Gans, Zumpt, Ancillon, Bekker, both the Tiecks, both the Schadows, must be mentioned.—The university, founded in 1810, has boasted in speculative philosophy, the possession of such men as Fichte, Hegel, and Schelling; in natural science, Humboldt, Steffens, Lichtenstein, Mitscherlich, Schubert, Dove, Ehrenberg; in mathematics, Ohm, Dirichlet, Jacobi; in astronomy, Encke; in medicine, Schönlein, Müller, Jüngken, Dieffenbach, Langenbeck; in philology, Boeckh, Bekker, Bopp, Lachmann, Zumpt, both the Grimms, Gerhard, Ritscher; in history, Raumer, Ranke; in geography, Ritter and Rooin; in jurisprudence, Savigny, Gans, and a host of others; in theology, Schleiermacher, Marheineke, Neander, Nitzsch. During the last 20 years, however, its renown has considerably declined, especially in theology, jurisprudence, philology, and philosophy. During the winter semestre of 1857-'58 the attendance of students was as follows: Protestant theology, 812; Catholics, none; political science, 607; medicine, 808; philology, 343; natives, 1,090; foreigners, 480; *hospitanti*, 851; total number, 2,421. The number of professors and teachers at the university is 175. The library, under the direction of the renowned Pertz, has 500,000 volumes, and many valuable manuscripts, and is the largest and best in Germany; connected with it is a separate university library, for the exclusive use of teachers and students, of 100,000 volumes. The clinical, anatomical, and chemical institutions and collections, the botanic garden, the mineral cabinet, the obstetric establishment, the zoological

museum, are among the best of their kind in the world. Beside the university, there is, at Berlin, an academy of sciences and arts, whose members also belong, for the most part, to the former; among the 6 gymnasia that of the Gray convent is celebrated, and none are insignificant. The astronomical observatory, the school for midwives, the seminary for teachers, and that for female teachers, an architectural school and a technical academy, a missionary institute, an academy for military surgeons, 9 technical schools, a school of farriery, a cadets', an artillery and engineer school, and a great number of public and private primary and secondary schools, are deserving of mention. There are scores of scientific, literary, and artistic societies of almost every kind, and public lectures of the highest merit are nowhere so common as in Berlin. Every second year there is a public exhibition of productions in the fine arts, while the sculptures and paintings in the ateliers of Cornelius, Begas, Magnus, Kiss, Drake, and others, are generally open for public inspection. The old museum is a gallery of pictures and antique vases; the new one, opposite the king's palace, in one of the finest public squares of the world, comprises the Egyptian museum, arranged and enriched by the celebrated Lepsius, a gallery of pictures and statuary, and the celebrated frescoes of Kaubach in the stairway. The armory, undoubtedly the finest in Europe, in which there are weapons enough to equip 150,000 men, is artistically arranged. The private picture-galleries of M. Wolff, Consul Wagener, and Count Raczynski, are rich, and open to public inspection. Among the numerous singing societies, the singing academy, founded in 1790, and the two Liedertafeln, are worthy of mention. The royal opera and theatre, once rendered celebrated by such artists as Heik, Devrient, Wolff, Crelinger, Seydelmann, have sadly declined since the reign of the present king, and so have the 5 other theatres, among which is a French one. The number of churches is small, and though the present king has built 3, they do not accommodate one-third of the population; but even these churches are never filled. Among the great number of benevolent institutions, there is a large hospital called the *Charité*, 2 orphan asylums, Wadzeck's institution, the Louisenstiftung, and other hospitals, and the institutes for the blind and deaf, an insane asylum, the invalid asylum, and many others.—Berlin is the largest manufacturing, trading, and commercial place of Prussia, and owes in this respect much to former kings. Royal manufacturing and commercial institutes, like the *Seehandlung*, monopolize whole branches of industry, but in spite of this, private enterprise is generally thriving. Machine-shops, iron foundries, wool, silk, cotton, and other manufactures, are conducted on a large scale; the dyeing establishments, the manufactures of ribbon, gold, silver, looking-glasses, carriages, musical instruments, porcelain, and paper, and the sugar

refineries, are renowned; the tapestry, carpeting, wax-cloth, tin and wooden ware, wood and marble imitation ware, the composition metal fabrics, the philosophical instrument manufactories, and many others, must not be forgotten.

BERLINGHIERI, ANDREA VAOCA, an Italian surgeon, born in Pisa, in 1772, died in the same city, Sept. 6, 1826. He studied anatomy at Paris, under Desault, Pelletan, Baudelocque, Dubois, and Boyer, and in England, under Hunter and Bell, and, on his return to Pisa, received the degree of doctor of medicine, and published some observations on Bell's system of surgery. In 1799 he was appointed to assist his father, who was professor of surgery in the university of Pisa, and, 3 years later, was placed at the head of the school of clinical surgery, which was then founded. He invented useful instruments for performing the operations of cystotomy and cesophagotomy, and for the treatment of trichiasis, the lachrymal fistula, and the fracture of the femur bone. He made improvements in many other surgical instruments and processes, and was the author of numerous treatises on professional topics.

BERLIOZ, HECTOR, French musical composer, born at Côte Saint André, in the department of Isère, Dec. 11, 1808. He was educated for the medical profession, but devoted his leisure to the study of music. At Paris, where he had been sent to complete his knowledge of the healing art, he neglected the lectures of the faculty, and entering the *conservatoire de musique*, was discarded by his father, a country physician, and earned a bare subsistence by singing in the chorus at one of the Paris theatres. Devoting himself to music, he carefully studied composition, won the 2d prize at the conservatoire in 1828, and the 1st prize in 1830, by his cantata of "Sardanapalus." This success made him a pensioner of the academy of fine arts, at whose expense he visited Italy for 18 months. On his return his compositions showed that he had employed his time advantageously. Public opinion was divided as to the merits of his productions. Liszt declared them admirable; Paganini's admiration was unusually expressed, in the form of a check on his banker for 20,000 francs in favor of M. Berlioz. His requiem, in 1837, performed at the church of the *Invalides*, at the funeral of Gen. Damrémont, established his reputation. His first opera, "Benvenuto Cellini," was produced in Sept. 1838, and did not succeed, so much had he abandoned the old rules of art. Very popular, on the other hand, was the grand dramatic symphony of "Romeo and Juliet," performed at the conservatoire in Nov. 1839. His symphonies are allowed to be his best compositions, and abound in grand orchestral combinations and effects. Most remarkable among them are the *Symphonie funèbre et triomphale*, written, in 1840, for the inauguration of the column of July, in the *Place de la Bastille*. As a conductor, M. Berlioz has distinguished himself in Germany, Russia, and England, as well

as in France. Under his direction, in 1844, 1,200 musicians performed, at Paris, the "Hymn to France," which he composed for that occasion. M. Berlioz, who is a prolific composer, is also an accomplished art critic, and has contributed largely, in that capacity, to the *Journal des Débats*. He is librarian to the *Conservatoire de musique*. Soon after his return from Italy, in 1838, M. Berlioz married the beautiful Miss Harriet Smithson (born March 18, 1800), an Irish lady, who, after performing with marked success in the higher characters of tragedy and comedy, at Drury Lane theatre, was principal actress at the English theatre in Paris, in 1829-'30. M. Berlioz, who first saw her while he was yet a pupil at the conservatoire, so greatly admired her in the character of Juliet, that he formed the determination to attach her to him by the tenderest of all ties, should fortune ever enable him to do so. Madame Berlioz, who withdrew from the stage on her marriage, died at Paris in 1854.

BERME, in fortification, a horizontal bank of ground left standing between the upper interior edge of the ditch and the exterior slope of the parapet of a work. It is generally made about 8 feet wide. Its principal object is to strengthen the parapet, and to prevent the earth of which it is composed from rolling down into the ditch, after heavy rain, thaw, &c. It may also serve sometimes as an exterior communication round the works. It is, however, not to be overlooked that the berme serves as a very convenient resting and collecting place for storming and scaling parties, in consequence of which it is entirely done away with in many systems of permanent fortification, and in others protected by a crenellated wall, so as to form a covered line of fire for infantry. In field fortification, or the construction of siege-batteries, with a ditch in front, a berme is generally unavoidable, as the scarp of the ditch is scarcely ever revetted, and without such an intermediate space, both scarp and parapet would soon crumble under the changes of the weather.

BERMONDSEY, a parish of the county of Surrey, England, forming one of the suburbs of London. It is included in the borough of Southwark, on the east. Pop. in 1851, 48,128. Shipbuilding and tanning are extensively carried on here.

BERMUDAS, or SOMERS ISLANDS, in the Atlantic ocean, lat. 32° 15' N., long. 64° 50' W., 580 miles S. S. E. from Cape Hatteras. They belong to Great Britain, and contain above 12,000 acres; pop. in 1851, exclusive of troops, convicts, and government officials, 11,092, of which 6,428 were colored. The number of islets is considerable; the principal are Bermuda, or Long island, St. George's, St. David's, Somerset, and Ireland. They are of coralline formation, the rocks being in different stages of progress. The islands are healthy, the climate is delightful. Vegetable productions of all kinds are in great abundance; the potatoes are an article of export especially to the United States, where they

arrive long before the native crop is ripened, and the arrowroot excels that of any other place. The fisheries are productive, and whale-fishing, on a small scale, is carried on. There are no fresh-water springs, and the rain water is stored in tanks. The situation of the group in the edge of the trade-wind has given them an unpleasant notoriety for storms and hurricanes, and "the vexed Bermoothes" is a title which justly applies to them. The Bermudas are a naval and military station, for which purpose they have been fortified. They are a convict settlement of Great Britain, but the deportation of criminals has not been to any considerable extent. In 1850 there were 1,566 convicts. The islands are supposed to have been discovered by Juan Bermudez, in 1522. In 1609 Sir George Somers was wrecked on the Bermudas, and made his way to Virginia (his original destination) in 2 cedar-built vessels. He was sent back from the Virginian settlement to procure a store of the wild hogs from the Bermudas, but he died in the islands, and his men bore away for England. In 1612 the islands were settled by charter from James I., and in 1620 a regular government was established, and the population, having been greatly increased, was estimated to amount to 10,000 persons, probably an exaggeration. The government is in the hands of a governor, council, and legislative body. In 1852 Bermuda had 42 vessels of 2,952 tons. In 1850 the imports were £180,500; exports, £19,960; revenue, £12,680; expenditure, £16,227, the deficiency being made up by parliament. The military expenditure in 1850 was £70,000; the convict expenditure, £80,000. These figures are sterling, the currency being one-third less in value.

BERMUDEZ, GERONIMO, an old Spanish poet, supposed to have been born about 1580, and to have been alive in 1589. He was born in Galicia, resided some time in Portugal, and was a professor of theology at Salamanca. His most important works were 2 tragedies on the subject of Ines de Castro, entitled respectively *Nise lastimosa* (Nise or Ines, of which Nise is an anagram, the unfortunate), and *Nise laureada*, or Ines triumphant. The first of these is copied, indeed almost translated, from *Ines de Castro*, a tragedy by the Portuguese poet Ferreira. The other is a continuation of the first, and is original, but has little merit. Bermudez was well acquainted with Latin, and wrote a poem in that language entitled *L'Hesperoidea*, which he afterward translated into Spanish verse.

BERMUDEZ DE CASTRO, DON SALVADOR, a Spanish poet, born at Cadiz in 1817. He graduated at the university of Sevilla, where he also took the degree of doctor of laws. He was afterward one of the editors of the *Revista de Madrid*, in which publication appeared many of his poems.

BERN, one of the principal cantons of Switzerland, and the largest and most populous of all; area variously estimated at from 2,565 to 8,500 sq. m.; pop. 332,050 in 1818, 407,918

in 1837, 458,801 in 1850, all of whom, except 54,044 Catholics and 1,000 Mennonites, belong to the Reformed church, and, with the exception of perhaps 100,000 Frenchmen, in the Jura, to the German nationality. Bern is situated between lat.  $46^{\circ} 20'$  and  $47^{\circ} 50' N.$ , and long.  $6^{\circ} 50'$  and  $8^{\circ} 27' E.$  It is bounded N. by France, E. by the cantons of Soleure, Aargau, Lucerne, Unterwalden, and Uri; S. by Valais, and W. by Vaud, Freyburg, and Neuchâtel. The city of Bern is the capital; pop. in 1850, 26,840. The southern frontier toward Valais is formed by the highest crest of the main chain of the Swiss Alps, the so-called Bernese Alps, with the following peaks reaching to over 11,000 feet above the sea: Finsteraarhorn (14,106), Schreckhorn (13,886), Wetterhorn (12,176), Mönch, Eiger, Jungfrau (13,718), and numerous high mountain passes, but only 8 of them practicable for carriages, of which the Grimsel pass is the most commodious. From the crest northward stretch some dozen of steep and mighty mountain ridges, none much over 8,000 feet high. The valleys between these ridges are much deeper out into the mountain base than any other on the northern slope of the Alps, and therefore exceedingly fertile and mild, in spite of the general elevation of the canton, which around the city of Bern is still as high as 1,850 feet. From the city down toward the north-west these ridges meet with the forerunners of the Jura mountains, embracing within long ridges long parallel valleys, with a climate somewhat rougher than in the rest of the canton. There is in the whole canton no very broad plain, the comparatively largest being near the lake of Thun; but the main valleys, those of the rivers Aar, Birs, Doubs, Emmen, Simmen, and others, are generally extensive. More than 20 lakes, of which those of Thun, Brienz, and Biel are noteworthy, and a great number of small streams, water the canton. The northern half of it may be said to be rather an agricultural, the southern rather a grazing region, while the less fertile high valleys of the Jura form a manufacturing district. The only agricultural produce for export is cheese, while in many years grain is imported; the southern valleys produce chestnuts, figs, walnuts, wine, fruit; the forests consist of white and red pine and beeches. Hay is produced abundantly, but not for export. Gold is washed in the Emmen river, iron ore occurs here and there, naphtha in the little brooks of the valley of Habkerei, marble and sandstone are of frequent occurrence, and excellent millstones are fabricated from the granite of Wittlisbach. Timber as well as carved wooden wares is to some extent exported. Flax is largely grown in the valley of the Emmen; there are linen, woollen, and silk manufactories in the city and vicinity, and extensive watch manufactories are carried on in the Jura mountains. The manufacturing industry is only lately beginning to be more varied and extensive. The transportation traffic is lively, especially as during the last 4 years Switzerland has

built 3 or 4 railroad lines, connecting with the German and future Italian railroads. Roads and bridges are at present being built extensively; the canton has had a bank since 1836. —The population of the canton belongs in the northern portions to the Alemanni or Swabian, in the southern to the Burgundian tribe, which settled here after the expulsion of the Romans in the 5th century. The original political constitution of these tribes was thoroughly democratic, and remained so down to the 18th century or later, when it gradually became impaired in the open country by the increasing power of the nobility, and later by that of the patrician families of the city. Belonging to the Burgundian kingdom, and from the 11th century to the German empire, the territory of Bern was very small, until it was made a free city by the emperor Frederic II. in 1218, and increased after the end of the 18th century by successful struggles with the emperor and the more powerful nobles, while the lower class of the nobility found in the city a ready refuge from the magnates, and were absorbed into the patrician ranks. After the accession of Bern to the confederation of the 4 original cantons in 1353, it contributed greatly to the success of the Swiss in their struggles against Austria, Burgundy, and Milan; and it extended its sway by purchase and conquest of Aargau, Vaud, and other districts, and a century ago embraced an area of nearly double its present size. In 1528 the reformation began to spread rapidly all over the canton, and soon became the exclusive religion. The growing wealth of Bern and its aggressive policy could not be favorable to the preservation of the old popular liberty. Gradually the country people were reduced to obedience, first in the conquered districts, which under Austrian, Burgundian, and Savoyard sway had already become inured to subjection, afterward in the other districts, and at last, subsequently to the 16th century, even the poorer classes of the city and the country towns. The patrician families, possessed of great wealth, administrative skill, and ancient military glory, had their standing army, and after 1470, when the citizens rebelled for the last time against them, and drove them out at least for a single year, this aristocracy restricted more and more the remaining popular rights, and became a well-cemented oligarchy, proud and haughty as that of Venice. The first French revolution put an end to this state of things in 1798, and after the unfortunate battles of that year founded a Helvetic republic, in which the territory of Bern was divided into 4, and subsequently into 8 cantons, Aargau and Vaud becoming independent. After the restoration, and under the influence of Austria, the ancient aristocracy and government were, with a few democratic changes, revived, until the second French revolution, when the new constitution of 1831 was forced upon the patricians. The concessions made by them did not, however, satisfy the growing democratic spirit of the masses and

in 1846, under the influence of the Sonderbund excitement, a revision was enforced which was ratified by a popular vote of 36,079 against 1,267. It abolished all class privileges, established perfect equality of all citizens before the law, granted political rights, and the right of voting, to every male citizen of over 20; organized the administration and judiciary after modern democratic principles; guaranteed the rights of man, and promised trial by jury. Taxes having been unknown in Bern up to that time, a new income tax of  $\frac{1}{10}$  of 1 per cent. became indispensable for carrying out these new institutions, and created dissatisfaction enough to give a momentary ascendancy to the conservative party in 1851, but without producing a permanent change in the new form of government. The late civil wars of Switzerland and the political reforms of Bern have involved the canton in a public debt of 4,000,000 francs, which, however, is overbalanced by a public domain and capital of nearly 80,000,000, making Bern comparatively the richest state of Europe. The yearly expenditure is about 4,000,000 francs, the public income rather less.—The city of Bern, at present the seat of the administration of the Swiss confederation, is in a romantic situation, on a peninsula formed by the river Aar, which here forms a splendid cataract, and is crossed by a stone bridge. The city is very well built, with many remnants of ancient architecture, of which the cathedral, the church of the Holy Ghost, built in 1122, the citizens' hospital, the magnificent infirmary with an endowment of 8,000,000 francs, are remarkable. The city library has 30,000 volumes, including valuable historical treasures, and a museum of natural history, founded in 1802. The university, founded in 1834, has about 50 teachers, and 200 students. The federal palace, the iron Murtner gate, the unsurpassed promenades, with one of the grandest prospects of the Alps, are noteworthy. The city as well as the canton possesses great attractions for the host of travellers, from whom a considerable income is derived. The wall ditches are renowned for bears, kept there as the heraldic animal of Bern, which derives its name from it, and are stocked with deer. The armory, the richest in Switzerland, is full of ancient weapons and curiosities. The city is, to some extent, industrial, and produces cloth, printed linen, silk and cotton fabrics. Haller, the German poet, one of the founders of German classical poetry, was born here. Pop. in 1851, 26,840.

BERNADOTTE, JEAN BAPTISTE JULES, marshal of the French empire, prince of Ponte Corvo, and, under the name of Charles XIV. John, king of Sweden and Norway, was born Jan. 26, 1764, at Pau, in the department of Basses Pyrénées, died March 8, 1844, in the royal palace at Stockholm. He was the son of a lawyer, and was educated for that profession, but his military impulses induced him to enlist secretly, in 1780, in the royal marines, where he

had advanced to the grade of sergeant, when the French revolution broke out. Thence his advancement became rapid. In 1792 he served as colonel in Oustine's army; commanded a demi-brigade in 1793; was in the same year, through Kleber's patronage, promoted to the rank of brigadier-general, and contributed, as general of division in the army of the Sambre and Meuse, under Kleber and Jourdan, to the victory of Fleurus, June 26, 1794, the success of Jülich, and the capitulation of Maestricht. He also did good service in the campaign of 1795-'96 against the Austrian generals Clairfait, Kray, and the archduke Charles. Ordered by the directory, at the beginning of 1797, to march 20,000 men as reinforcements to the Italian army, his first interview in Italy with Bonaparte decided their future relations. In spite of his natural greatness, Bonaparte entertained a petty and suspicious jealousy of the army of the Rhine and its generals. He understood at once that Bernadotte aspired to an independent career. The latter, on his part, was too much of a Gascon to justly appreciate the distance between a genius like Bonaparte and a man of abilities like himself. Hence their mutual dislike. During the invasion of Istria Bernadotte distinguished himself at the passage of the Tagliamento, where he led the vanguard, and at the capture of the fortress of Gradisca, March 19, 1797. After the so-called revolution of the 18th Fructidor, Bonaparte ordered his generals to collect from their respective divisions addresses in favor of that *coup d'état*; but Bernadotte first protested, then affected great reluctance in obeying, and at last sent an address to the directory, but quite the reverse of that asked for, and without conveying it through Bonaparte's hands. The latter on his journey to Paris, whither he repaired to lay before the directory the treaty of Campo Formio, visited and cajoled Bernadotte at his headquarters at Udine, but the following day, through an order from Milan, deprived him of half his division of the army of the Rhine, and commanded him to march the other half back to France. After many remonstrances, compromises, and new quarrels, Bernadotte was at last prevailed upon to accept the embassy to Vienna. There, acting up to the instructions of Talleyrand, he assumed a conciliatory attitude which the Paris journals, inspired by Bonaparte and his brothers, declared to be full of royalist tendencies; expatiating, in proof of these charges, on the suppression of the tricolored flag at the entrance of his hotel, and of the republican cockade on the hats of his suite. Being reprimanded for this by the directory, Bernadotte, on April 18, 1798, the anniversary of a Viennese anti-Jacobin demonstration, hoisted the tricolored flag with the inscription, "Liberty, equality, fraternity," and had his hotel stormed by a Viennese mob, his flag burnt, and his own life endangered. The Austrian government declining to give the satisfaction demanded, Bernadotte withdrew to Rastadt with all his legation; but the directory, on the advice of Bonaparte,

who had himself been instrumental in provoking the scandal, hushed up the affair and dropped their representative. Bernadotte's relationship to the Bonaparte family consequent upon his marriage, in Aug. 1798, with Mlle. Désirée Clary, the daughter of a Marseilles merchant, and Joseph Bonaparte's sister-in-law, seemed but to confirm his opposition to Napoleon. As commander of the army of observation on the upper Rhine, in 1799, he proved incompetent for the charge, and thus verified beforehand Napoleon's judgment at St. Helena, that he was a better lieutenant than general-in-chief. At the head of the war ministry, after the directorial émeute of the 80th Prairial, his plans of operation were less remarkable than his intrigues with the Jacobins, through whose reviving influence he tried to create for himself a personal following in the ranks of the army. Yet one morning, Sept. 18, 1799, he found his resignation announced in the *Moniteur* before he was aware that he had tendered it. This trick was played upon him by Sièyes and Roger Ducos, the directors allied to Bonaparte. While commanding the army of the west, he extinguished the last sparks of the Vendean war. After the proclamation of the empire, which made him a marshal, he was intrusted with the command of the army of Hanover. In this capacity as well as during his later command of the army of northern Germany, he took care to create for himself, among the northern people, a reputation for independence, moderation, and administrative ability. At the head of the corps stationed in Hanover, which formed the first corps of the grand army, he participated in the campaign of 1805 against the Austrians and Prussians. He was sent by Napoleon to Iglau, to observe the movements of Archduke Ferdinand in Bohemia; then, called back to Brunn, he, with his corps, was posted at the battle of Austerlitz in the centre between Soult and Lannes, and contributed to baffle the attempt of the allied right wing at outflanking the French army. On June 5, 1806, he was created prince of Ponte Corvo. During the campaign of 1806-'7 against Prussia, he commanded the first *corps d'armée*. He received from Napoleon the order to march from Naumburg upon Dornburg, while Davoust, also stationed at Naumburg, was to march upon Apolda; the order held by Davoust adding that, if Bernadotte had already effected his junction with him, they might conjointly march upon Apolda. Having reconnoitred the movements of the Prussians, and made sure that no enemy was to be encountered in the direction of Dornburg, Davoust proposed to Bernadotte a combined march upon Apolda, and even offered to place himself under his command. The latter, however, sticking to the literal interpretation of Napoleon's order, marched off in the direction of Dornburg without meeting an enemy during the whole day; while Davoust had alone to bear the brunt of the battle of Auerstädt, which, through Bernadotte's absence, ended in an indecisive victory. It was only the meeting of

the fugitives of Auerstädt with the fugitives from Jena, and the strategical combinations of Napoleon, that counteracted the consequences of the deliberate blunder committed by Bernadotte. Napoleon signed an order to bring Bernadotte before a court-martial, but on further consideration rescinded it. After the battle of Jena, Bernadotte defeated the Prussians at Halle, Oct. 17, conjointly with Soult and Murat, pursued the Prussian general Blücher to Lübeck, and contributed to his capitulation at Radzau, Nov. 17, 1806. He also defeated the Russians in the plains of Mohrungen, not far from Thorn, Jan. 25, 1807. After the peace of Tilsit, according to the alliance concluded between Denmark and Napoleon, French troops were to occupy the Danish islands, thence to act against Sweden. Accordingly, March 28, 1808, the very day when Russia invaded Finland, Bernadotte was commanded to move upon Seeland in order to penetrate with the Danes into Sweden, to dethrone its king, and to partition the country between Denmark and Russia; a strange mission for a man destined soon after to reign at Stockholm. He passed the Belt and arrived in Seeland at the head of 82,000 Frenchmen, Dutch, and Spaniards; 10,000 of the latter, however, contriving, by the assistance of an English fleet, to decamp under Gen. de la Romana. Bernadotte undertook nothing and effected nothing during his stay in Seeland. Being recalled to Germany, there to assist in the new war between France and Austria, he received the command of the 9th corps, mainly composed of Saxons. The battle of Wagram, July 5 and 6, 1809, added new fuel to his misunderstandings with Napoleon. On the first day, Eugène Beauharnais, having debouched in the vicinity of Wagram, and dashed into the centre of the hostile reserves, was not sufficiently supported by Bernadotte, who engaged his troops too late, and too weakly. Attacked in front and flank, Eugène was roughly thrown back upon Napoleon's guard, and the first shock of the French attack was thus broken by Bernadotte's lukewarmness, who, meanwhile, had occupied the village of Adlerklaun, in the centre of the French army, but somewhat in advance of the French line. On the following day, at 6 o'clock in the morning, when the Austrians advanced for a concentric attack, Bernadotte deployed before Adlerklaun, instead of placing that village, strongly occupied, in his front. Judging, on the arrival of the Austrians, that this position was too hazardous, he fell back upon a plateau in the rear of Adlerklaun, leaving the village unoccupied, so that it was immediately taken by Bellegarde's Austrians. The French centre being thus endangered, Massena, its commander, sent forward a division to retake Adlerklaun, which division, however, was again dislodged by D'Aspre's grenadiers. At that moment, Napoleon himself arrived, took the supreme command, formed a new plan of battle, and baffled the manœuvres of the Austrians. Thus Bernadotte

had again, as at Auerstädt, endangered the success of the day. On his part, he complained of Napoleon's having, in violation of all military rules, ordered Gen. Dupas, whose French division formed part of Bernadotte's corps, to act independently of his command. His resignation, which he tendered, was accepted, after Napoleon had become aware of an order of the day addressed by Bernadotte to his Saxons, in discord with the imperial bulletin. Shortly after his arrival at Paris, where he entered into intrigues with Fouché, the Walcheren expedition (July 30, 1809) caused the French ministry, in the absence of the emperor, to intrust Bernadotte with the defence of Antwerp. The blunders of the English rendered action on his part unnecessary; but he took the occasion to slip into a proclamation, issued to his troops, the charge against Napoleon of having neglected to prepare the proper means of defence for the Belgian coast. He was deprived of his command; ordered, on his return to Paris, to leave it for his principedom of Ponte Corvo, and, refusing to comply with that order, he was summoned to Vienna. After some lively altercations with Napoleon, at Schönbrunn, he accepted the general government of the Roman states, a sort of honorable exile.—The circumstances which brought about his election as crown prince of Sweden, were not fully elucidated until long after his death. Charles XIII., after the adoption of Charles August, duke of Augustenburg, as his son, and as heir to the Swedish throne, sent Count Wrede to Paris, to ask for the duke the hand of the princess Charlotte, daughter of Lucien Bonaparte. On the sudden death of the duke of Augustenburg, May 18, 1810, Russia pressed upon Charles XIII. the adoption of the duke of Oldenburg, while Napoleon supported the claims of Frederic VI., king of Denmark. The old king himself offered the succession to the brother of the late duke of Augustenburg, and despatched Baron Moerner to Gen. Wrede, with instructions enjoining the latter to bring Napoleon over to the king's choice. Moerner, however, a young man belonging to the very large party in Sweden which then expected the recovery of their country only from an intimate alliance with France, on his arrival at Paris, took upon himself, in connection with Lapie, a young French officer in the engineers, with Seigneul, the Swedish consul-general, and with Count Wrede himself, to present Bernadotte as candidate for the Swedish throne, all of them taking care to conceal their proceedings from Count Lagerbälke, the Swedish minister at the Tuileries, and all firmly convinced by a series of misunderstandings, artfully kept up by Bernadotte, that the latter was really the candidate of Napoleon. On June 29, accordingly, Wrede and Seigneul sent despatches to the Swedish minister of foreign affairs, both announcing that Napoleon would, with great pleasure, see the royal succession offered to his lieutenant and relative. In spite of the opposi-

tion of Charles XIII., the diet of the States, at Örebro, elected Bernadotte crown prince of Sweden, Aug. 21, 1810. The king was also compelled to adopt him as his son, under the name of Charles John. Napoleon reluctantly, and with bad grace, ordered Bernadotte to accept the offered dignity. Leaving Paris, Sept. 28, 1810, he landed at Helsingborg, Oct. 2, there abjured the Catholic profession, entered Stockholm Nov. 1, attended the assembly of the states, Nov. 5, and from that moment grasped the reins of the state. Since the disastrous peace of Frederikshamn, the idea prevailing in Sweden was the reconquest of Finland, without which, it was thought, as Napoleon wrote to Alexander, Feb. 28, 1811, "Sweden had ceased to exist," at least as a power independent of Russia. It was but by an intimate alliance with Napoleon that the Swedes could hope to recover that province. To this conviction Bernadotte owed his election. During the king's sickness, from March 17, 1811, to January 7, 1812, Charles John was appointed regent; but this was a question of etiquette only, since from the day of his arrival, he conducted all affairs. Napoleon, too much of a parvenu himself to spare the susceptibilities of his ex-lieutenant, compelled him, Nov. 17, 1810, in spite of a prior engagement, to accede to the continental system, and declare war against England. He suppressed his revenues as a French prince; declined to receive his despatches directly addressed to him, because he was not "a sovereign his equal;" and sent back the order of the Seraphim, bestowed upon the new-born king of Rome by Charles John. This petty chicanery afforded to the latter the pretext only for a course of action long decided upon. Hardly was he installed at Stockholm, when he admitted to a public audience the Russian general, Suchtelen, who was detested by the Swedes for having suborned the commander of Sveaborg, and even allowed that personage to be accredited as ambassador to the Swedish court. On Dec. 18, 1810, he held a conference with Czernicheff, in which he declared himself "to be anxious to win the good opinion of the czar," and to resign Finland forever, on the condition of Norway being detached from Denmark, and annexed to Sweden. By the same Czernicheff, he sent a most flattering letter to the czar Alexander. As he thus drew nearer to Russia, the Swedish generals who had overthrown Gustavus IV., and favored his own election, retired from him. Their opposition, reechoed by the army and the people, threatened to become dangerous, when the invasion of Swedish Pomerania by a French division, Jan. 17, 1812—a measure executed by Napoleon on secret advice from Stockholm—afforded at last to Charles John a plausible pretext for officially declaring the neutrality of Sweden. Secretly, however, and behind the back of the diet, he concluded with Alexander an offensive alliance against France, signed March 27, 1812, at St. Petersburg, in which the annexation

of Norway to Sweden was also stipulated.—Napoleon's declaration of war against Russia made Bernadotte for a time the arbiter of the destinies of Europe. Napoleon offered him, on the condition of his attacking Russia with 40,000 Swedes, Finland, Mecklenburg, Stettin, and all the territory between Stettin and Volgast. Bernadotte might have decided the campaign and occupied St. Petersburg before Napoleon arrived at Moscow. He preferred acting as the *Lepidus* of a triumvirate formed with England and Russia. Inducing the sultan to ratify the peace of Bucharest, he enabled the Russian admiral Tchitchakoff to withdraw his forces from the banks of the Danube and to operate on the flank of the French army. He also mediated the peace of Orebro, concluded July 18, 1812, between England on the one side, and Russia and Sweden on the other. Frightened at Napoleon's first successes, Alexander invited Charles John to an interview, at the same time offering him the command-in-chief of the Russian armies. Prudent enough to decline the latter offer, he accepted the invitation. On Aug. 27 he arrived at Abo, where he found Alexander very low-spirited and rather inclined to sue for peace. Having himself gone too far to recede, he steeled the wavering czar by showing that Napoleon's apparent successes must lead to his ruin. The conference resulted in the so-called treaty of Abo, to which a secret article was appended, giving the alliance the character of a family compact. In fact, Charles John received nothing but promises, while Russia, without the slightest sacrifice, secured the then invaluable alliance of Sweden. By authentic documents it has been recently proved that it depended at that time on Bernadotte alone to have Finland restored to Sweden; but the Gascon ruler, deluded by Alexander's flattery, that "one day the imperial crown of France, when fallen from Napoleon's brow, might rest upon his," already considered Sweden as a mere *pis-aller*. After the French retreat from Moscow, he formally broke off diplomatic relations with France, and when England guaranteed him Norway by treaty of March 18, 1813, he entered the coalition. Furnished with English subsidies, he landed in May, 1813, at Stralsund with about 25,000 Swedes and advanced toward the Elbe. During the armistice of June 4, 1813, he played an important part at the meeting in Trachenberg, where the emperor Alexander presented him to the king of Prussia, and where the general plan of the campaign was decided upon. As commander-in-chief of the army of the north, composed of Swedes, Russians, Prussians, English, Hanseatic, and north German troops, he kept up very equivocal connections with the French army, managed by an individual who frequented his head-quarters as a friend, and grounded on his presumption that the French would gladly exchange Napoleon's rule for Bernadotte's, if he only gave them proofs of forbearance and clemency. Consequently, he prevented the generals placed

under his command from taking the offensive, and when Bülow twice, at Grossbeeren and Dennewitz, had vanquished the French despite his orders, stopped the pursuit of the beaten army. When Blücher, in order to force him to action, had marched upon the Elbe, and effected his junction with him, it was only the threat held out by Sir Charles Stewart, the English commissary in his camp, of stopping the supplies, that induced him to move on. Still the Swedes appeared on the battle field of Leipzig for appearance's sake only, and during the whole campaign lost not 200 men before the enemy. When the allies entered France, he retained the army of Sweden on her frontiers. After Napoleon's abdication, he repaired personally to Paris to remind Alexander of the promises held out to him at Abo. Talleyrand cut short his puerile hopes by telling the council of the allied kings, that "there was no alternative but Bonaparte or the Bourbons,—every thing else being a mere intrigue." Charles John having, after the battle of Leipzig, invaded the duchies of Holstein and Schleswig, at the head of an army composed of Swedes, Germans, and Russians, Frederic VI., king of Denmark, in the presence of vastly superior forces, was forced to sign, Jan. 14, 1814, the peace of Kiel, by which Norway was ceded to Sweden. The Norwegians, however, demurring to being so unceremoniously disposed of, proclaimed the independence of Norway under the auspices of Christian Frederic, crown prince of Denmark. The representatives of the nation assembling at Edisvold, adopted, May 17, 1814, a constitution still in force, and the most democratic of modern Europe. Having put in motion a Swedish army and fleet, and seized upon the fortress of Fredrickstadt, which commands the access to Christiania, Charles John entered into negotiation, agreed to consider Norway as an independent state and to accept the constitution of Edisvold, carried the assent of the assembled storting Oct. 7, and Nov. 10, 1814, repaired to Christiania, there, in his own and the king's name, to take the oath upon the constitution.—Charles XIII. expiring Feb. 5, 1818, Bernadotte, under the name of Charles XIV. John, was acknowledged by Europe as king both of Sweden and Norway. He now attempted to change the Norwegian constitution, to restore the abolished nobility, to secure to himself an absolute veto and the right of dismissing all officers, civil and military. This attempt gave rise to serious conflicts, and led, March 18, 1828, even to a cavalry charge upon the inhabitants of Christiania, who were celebrating the anniversary of their constitution. A violent outbreak seemed imminent, when the French revolution of 1830 caused the king to resort for the moment to conciliatory steps. Still Norway, for the acquisition of which he had sacrificed every thing, remained the constant source of embarrassments throughout his whole reign. After the first days of the French revolution of 1830, there existed a single man in Europe who

thought the king of Sweden a fit pretender for the French throne, and that man was Bernadotte himself. More than once he repeated to the French diplomatic agents at Stockholm, "How does it happen that Laffitte has not thought of me?" The changed aspect of Europe, and, above all, the Polish insurrection, inspired him for a moment with the idea of making front against Russia. His offers in this sense to Lord Palmerston meeting with a flat refusal, he had to expiate his transitory idea of independence by concluding, June 28, 1834, a convention of alliance with the emperor Nicholas, which rendered him a vassal of Russia. From that moment his policy in Sweden was distinguished by encroachments on the liberty of the press, persecution of the crime of *lèse-majesté*, and resistance to improvements, even such as the emancipation of industry from the old laws of guilds and corporations. By playing upon the jealousies of the different orders constituting the Swedish diet, he long succeeded in paralyzing all movement, but the liberal resolutions of the diet of 1844, which were to be converted, according to the constitution, into laws by the diet of 1845, threatened his policy with final discomfiture, when his death occurred.—If Sweden, during the reign of Charles XIV., partly recovered from a century and a half of miseries and misfortunes, this was due not to Bernadotte, but exclusively to the native energies of the nation, and the agencies of a long peace.

**BERNALILLO**, a county in the E. central part of New Mexico, with an area of about 900 sq. m. The Rio Grande and the Rio Puerco, which intersect it, and the Rio de San Jose, which forms its southern boundary, are the principal rivers. The surface in the E. is rough and mountainous. In 1850, this county yielded 17,701 bushels of wheat, 89,808 of corn, 2,800 of peas and beans, 8,500 pounds of wool, and 890 gallons of wine. Pop. 7,751. Albuquerque is the chief town.

**BERNARD**, saint and doctor of the Latin church, born at Fontaines, in Burgundy, in 1091, died in the abbey of Clairvaux, Aug. 20, 1153. Both of his parents belonged to noble families. His father, Tescelin, was a knight of the house of Châtillon, and his mother, Aleth, was a daughter of Count Bernard of Montbard. Bernard was the 3d of a family of 7 children. Before his birth his mother saw in her dream a white dog, spotted with red, and barking fiercely. The dream was interpreted to signify that the child to be born should be a guardian to the church, a foe to its enemies, and should bark loudly against them. It is uncertain whether the name afterward given to Bernard of "watch-dog to the church," produced the legend, or the legend produced the name. From the beginning the child was destined to a clerical and scholastic life, to which he was inclined by his native preference. His early thirst for knowledge was amazing. While his brothers shared the martial tastes of their rest-

less father, Bernard, busy in his studies, was astonishing all his teachers at Châtillon. His love for study was accompanied and sanctified by ascetic practices, which his mother encouraged. Visions of the infant Jesus were granted to him, and both mother and son were instant in prayer that all worldly passions might be extinguished in their hearts. On his return from the school at Châtillon he entered into a sort of domestic cloister, the blessed society of which was too soon broken by the death of his mother. At this time he was 19 years old. His youthful friends took advantage of this event to try upon him the fascinations of a worldly life. But the memory of his mother was stronger than their persuasions; the charms of splendor, and fame, and love, which they set before him, could not change his native bias, and he determined, at any cost, to be a monk. The passion which tempted St. Anthony was cured, it is said, in Bernard's case by a timely bath in a tank of cold water, which chilled out of his body all impure and unhallowed heat. Like Augustine and Gregory, and many of the early fathers, he asserted a miraculous call to the monastic life. And he would not go alone to his convent. He remembered, like Dives in the parable, that he had "five brethren," and his first care was to make these brethren such as himself, and bring them to share his holy lot. Andrew and Bartholomew, younger brothers, were easily won. Guy, the eldest, was for a time retained by his wife, but a judicious appeal to her fears overcame her reluctance, and she consented to go to a nunnery and leave her lord to his religious destiny. A rich and warlike uncle was next the proselyte of his pious nephew, and giving up castles, and retainers, and treasure, assumed the cowl and frock of perpetual poverty. Gerard, the second brother, was more insensible. He loved the excitement of knightly life, and could not believe that the world and its good things ought to be despised. A wonderful vision disarmed his obstinacy. Lying wounded in a dungeon, he saw and heard the Holy Spirit calling to his mind a prophecy which his brother had made, that by that wound the Lord would find the way to his heart. Then, as to Paul at Philippi, the prison doors were opened, his chains were thrown off, and he was led into the church by Bernard to join the devoted brotherhood. The rule chosen by the brethren was the new Cistercian rule, and they applied themselves diligently to fulfil their season of novitiate. Bernard's discipline was rigorous in the extreme. His labors were severe, his fastings protracted, his sensibilities were blunted by various exposure, till he lost almost all sense of outward impressions. His meagre and haggard frame was a fearful witness of the struggle of the soul in its contest with the body. Bernard gloried in this physical weakness, and used it as a proselyting influence. His novitiate year brought numerous converts. Sons were separated from fathers, husbands from wives, the knight from his hall,

and the epicure from his pleasure, to try the blessing of a hermit life. A son and a sister of the devoted family remained yet to be won to the church. Nivard, the Benjamin of the house, was left to comfort the old father, forsaken by his children. But the boy preferred a heavenly to an earthly father, and the prospect of a fuller inheritance could not keep him back. "It is too unfair," said Nivard; "you give me earth while you take heaven. I must go with you." Daily new recruits were added, and before Clairvaux had gathered its company, the slopes of the Alps and Pyrénées testified, by their frequent processions and their multiplied vigils, to the efficient zeal of the young Cistercian evangelist. The year of novitiate was passed by the brethren in the convent of Oiteaux. In this time several new convents had been founded in the neighborhood. The abbot of Oiteaux, a shrewd and skilful judge of character, had discovered qualities in Bernard which indicated him as the proper head of a new foundation. In the year 1115, Bernard, with 12 monks, among whom were his brothers, was sent out to find in the province of Champagne a suitable place for a Cistercian community. He chose a wild gorge in the diocese of Langres, noted as a haunt of robbers, the ill-omened name of which was the "Valley of Wormwood." Here the self-denying brethren built their cells, arranged their duties, chose Bernard their abbot, and attracted by their sanctity such crowds of visitors that the new name of "Clairvaux," or "Beautiful Valley," seemed fairly justified. The numbers of the brotherhood rapidly multiplied. Their charities were the praise of all the region. Their austerities recalled the legendary story of eastern cenobites. The gifts which came to them were at once redistributed to the poor and the penitent. In all their labors, in all their watchings, in all their self-denials, Bernard was foremost, and the pride of asceticism was shamed by his ghastly countenance and emaciated frame. The fame of miracle was speedily added to the evidence of such endurance. Men came to Clairvaux to be healed of their infirmities by one whom sickness had reduced almost to spiritual proportions, and whose courage and power no disease or starvation seemed able to destroy. Without the care of an earthly friend, however, it is probable that the protection of the Divine Spirit would have failed to rescue the abbot from his obstinate self-immolation. This friend felt that it was too soon for so rare a man to die. Compelled by superior authority to submit himself to regimen and a physician, Bernard, against his will, recovered; but the chapter of his long sickness is as edifying as any of his life. William of Champeaux, the friend who saved him from himself, has given a glowing account of his interviews with the sufferer in those hours of pain, the patience, humility, trust, exaltation of that darkened cell,—the visible forms of saints, angels, and

the Virgin, which came to lend aid to their wailing devotees,—the celestial music which seemed to float around, and the inspired words which seemed to flow like a heavenly voice from the lips of this dying Christian. The restoration from such a sickness seemed a new miracle. It taught Bernard a useful lesson: that immoderate self-denial was not less an evil than immoderate indulgence. Henceforth, recognizing his own weakness of body, he was less enthusiastic in his austerities. The 12 succeeding years of Bernard's life were devoted to monastic work, either in the reform and direction of the convents already established, or in suggestions concerning new establishments. His correspondence in this period was vast, and he gave audience to great numbers who came to consult him. His studies were not less vigorously prosecuted, both in scriptural and patristic lore; and while metropolitan bishops marvelled at his sagacity, the monks of his convent listened with admiration to his daily religious readings. Augustine's theology and the Canticles of Solomon were favorite themes. In the year 1124, his heart's desire was gratified by the vows which the last of his family, Humbeline, his only sister, offered at one of the convents of his foundation. Two years before she had visited Clairvaux, and had been so impressed with the sanctity of its life that she returned determined to renounce the pomp of the world, the charms of her high social rank, and the society of her noble husband, for a home in the cloister. A posthumous sainthood rewarded her devotion. The eminent fitness of Bernard for public affairs compelled him gradually to engage in labors of a different kind. He was repeatedly called abroad to reconcile disputes between bishops and their dioceses, between the church and the nobles. No arbiter had such influence. The prelates of the church could depend upon him to sustain them against the civil power, but he asked in return that they should renounce the luxuries of secular living. Abbot Suger, prime minister of Louis the Fat, was persuaded by Bernard to relinquish his secular station and confine himself at St. Denis to his religious charge. Henry, archbishop of Sens, and Stephen of Paris, were supported in their appeal to Rome, against the king, by the commanding voice of the abbot of Clairvaux. At the council of Troyes, in 1128, he vindicated the canons of the church, and took part in those stormy debates about the excesses of the Templar knights. At the council of Châlons, in 1129, he assisted to depose the bishop of Verdun. Repeated offers of lucrative sees were steadily refused by him. He preferred to dictate Catholic faith and practice from his convent, rather than accept any bishopric. In the year 1130, an event occurred which drew Bernard from the seclusion of his convent, and caused him to make longer journeys and enter more into political life than ever before. Less than 50 years after the death of Hildebrand, the mag-

nificent papal empire which he had consolidated was threatened with ruin by a schism in the sacred college. Rival claimants disputed the divine right of spiritual lordships. Before the death of Honorius II., the succession had been apparently secured by Peter of Leon, a cardinal whose ability, learning, and eloquence, all confessed, whose wealth was unbounded, and whose genius for management few could resist. The chief objections to him were that he was the son of a Jew, and that his tastes were rather secular than religious. On the death of Honorius, without making official announcement or calling a regular meeting of the college, the cardinals who were hostile to Peter met secretly, and published simultaneously with the announcement of the death of the former pope, the name of the new one, Innocent II., whom they had chosen. The partisans of Peter, indignant at the act, held at once a counter meeting, and chose Peter, who took the name of Anacletus. The strife was unequal. Wealth and ability turned the scale in favor of the cardinal of Leon. Innocent and his partisans were compelled to seek refuge in Tuscany, and leave the Jew's son to reign in the capital of Christendom. The king of France seized the opportunity of interfering, and called a council at Étampes, near Paris, to decide between the claimants. Bernard came to this council, gave his support to Innocent, and procured a decree in favor of the exile. He sustained the cause of the poor claimant against the rich, of the humble Christian against the haughty grandee. It was easier, however, to decree the right of Innocent than to restore him to Rome or depose his rival. The consent of the sovereigns of Europe must first be obtained, and the pretensions of Anacletus must first be set aside in the secular courts. Bernard undertook the task of doing this. He became Innocent's missionary. Henry, of England, who was first visited, hesitated to admit the justice of Innocent's cause, but yielded to the obliging offer of Bernard: "You can answer to God for all your other sins," said the astute abbot, "leave this to me; I will take the responsibility!" From England, after a tour of preaching through France, in which he left every one devoted to Innocent, Bernard sought the German emperor, already half inclined to Innocent's party. At Liège the solemn meeting took place between the greatest of temporal and the chief of spiritual sovereigns (for Innocent had accompanied Bernard on this journey). Holding the bridle of the pope's horse, the emperor led his holy guest through the streets of the city. But more conspicuous than either pope or emperor in the procession was the gaunt and bent figure of that monk, whose works and worth had won for him, throughout all Europe, the renown of a saint. Lothaire was willing to defend the claim of Innocent, if he might be allowed the right of investiture, formerly exercised by the German emperors. Bernard would not make any such

concession, or consent to yield any point which the church had gained upon the state. He asked, and finally won from the emperor, an unconditional support of Innocent. The grateful pope in the next year, 1181, honored his advocate by a visit to Clairvaux, where himself and his companions were greatly edified and moved by the simple furniture, the coarse garments, the scanty fare, and the pious hymns of the Cistercian brotherhood. New privileges to the order were the result of this visit, and the tithes which they had paid to the elder order of Cluny from henceforth ceased. In 1182 Bernard accompanied Innocent into Italy. His labors in this peninsula were various and excessive. The division between its various states tended to hinder the restoration of Catholic unity. Some of them had already declared for Anacletus, in hatred to others who were favorable to Innocent. It was Bernard's joy to reconcile these hereditary foes. First Genoa, whose jealousy of Pisa was obstinate and deep-rooted, was subdued by the preaching of the great apostle, until the people almost forced him to stay as their chief bishop. Then Pisa, in turn, yielded to the persuasions of his eloquence. In turbulent Milan he found a harder task; but here, too, the prejudice of prelates and the passions of the multitude were charmed into submission, and the city claimed the saintly mediator to be the fit successor of Ambrose in their cathedral chair. Bernard could hardly withhold himself from their urgency. He granted them the partial boon of a Cistercian colony. In the mean time, the indefatigable missionary was found negotiating at the German court, to reconcile an imperial uncle with the nephews of his predecessor, Conrad and Frederic; and a finer issue of this secondary mission was the conversion of the duchess Aloïde, sister to Lothaire, from her scandalous life to the practice of piety. Returning, after 5 years of conflict, to his quiet home at Clairvaux, he was delighted to find its affairs peaceful and prosperous, unity of spirit among the brethren, and a welcome as fraternal as that which Alpine peasants had given him all along his way. If the shepherds came down from their rocks and begged him to bless their children, the monks wept for joy when they embraced the knees of their holy director. His hope of rest was soon disappointed. The embers of schism rekindled. Count William of Aquitaine, the boldest of French barons, had sworn an oath to listen to no sophistries which should persuade him and his people away from their allegiance to Anacletus. His arbitrary insolence, the terror inspired by his gigantic presence, and his real ability, both as a statesman and a general, made him a more formidable enemy than Bernard had thus far dealt with. He had deposed bishops who supported Innocent. Failing in his argument with this bold man, Bernard tried an experiment, such as Ambrose had tried with Theodosius. He chose the occasion of the holy mass in the church where William was wont to attend.

The mystic rite of transubstantiation performed, the monk, who seemed now to the multitude to be a very prophet of God, lifted the paten with its wafer, bore it out to meet the entering count, and, with stern voice and flashing eye, thus addressed him: "We have prayed to you, and you have despised us. With many servants of God we have prayed, and you have mocked our vows. Now comes to you the Son of the Virgin, the head of the church whom you persecute. Now stands here thy Judge, the Judge of all the earth! Wilt thou despise, as thou hast despised his servants, the Judge into whose hands thy soul shall fall?" Trembling, the crowd waited the issue. An instant more, and the scowling hero turned pale, and the haughty count fell like a dead man at the feet of the prophet. He rose a penitent; and two years later, they wondered to see this reckless leader go off to finish his course and die a martyr in pilgrimage to the shrine of the Spanish St. James. In 1137, Bernard was a 3d time summoned from the quiet of his convent, to plead the cause of Innocent, before King Roger, of Sicily, who had possessed himself of the holy city. The necessity of unity in the church, and the right of majorities to decide disputed questions, were arguments which Roger and his partisans could not well resist. The opportune death of Anacletus weakened the schism still further; and, although the form of electing his successor was tried, the party were forced to confess themselves vanquished, and the persevering abbot received the testimonies of their final submission. Innocent was installed at Rome, and Bernard was able to see the fruit of his 8 years of toil and contest. Thus far the public work of Bernard had been mainly against schism. He was now to enter the field against heresy, and in defence of traditional Catholic faith. A visit to the convent of the Paraclete, of which Heloise was abbess, had acquainted him with the views and principles of Abelard, the great scholastic reformer. Through his influence, in the year 1140, a council was held at Sens to consider those opinions. From a conviction that his cause was hopeless, or from fear, as some say, Abelard did not dare to justify himself before the council, and his default was pronounced, with his sentence as a heretic. His death at Cluny, on the journey which he was making to Rome, saved his adversary from the annoyance of further controversy. In this and subsequent years Bernard's life was embittered by misunderstandings with the pope, who preferred the good-will of the secular powers to the friendship of that religious vassal who had placed him on the papal throne. In touching reproaches Bernard expresses his sorrow at this ingratitude and neglect. His influence at Rome, however, was soon regained. After the short reigns of Celestine II. and Lucius II., one of his own spiritual children, another Bernard of Clairvaux, was called to the chair of St. Peter. Eugenius III. (for that was the name which the

Cistercian assumed) hastened to declare his full confidence in his religious father. Bernard could write to him playfully, but proudly: "They say that I am more the pope than you are." The confidence of Eugene was speedily proved by the work which he intrusted to his friend of preaching and organizing a new crusade. Already the Christian kingdom in Syria, which Godfrey and his followers had won, was rent by internal feuds, and menaced by the gathering forces of the Saracens, who had made head at Edessa. Returning pilgrims brought back doleful tidings, and the call for aid was too loud to be disregarded. King Louis, of France, was ready to go, and only asked for the sympathy of his people and the alliance of the German emperor. Bernard now took up the mission of Peter the Hermit. He ran through France and Germany, in cities and villages, stirring up high and low, arousing indifference, inflaming piety, opening the coffers of the rich, promising indulgence to the profligate, and calling all, saints and sinners, together, to come to the holy war. His success was instant and wonderful. More than once his robe was torn to shreds in furnishing crosses to the eager volunteers. He writes to Eugenius that the cities and castles are deserted, that the wives are becoming widows, and that there is hardly one man to 7 women. Soon he had to moderate the excitement and check the excesses of the host which he had gathered. He strove especially to prevent the persecution of the Jews, which was the first sign of the new Christian fury. In the year 1147 the 2 great expeditions set out. Confusion marked their way, and disaster followed them. The Greek emperor, in his dealing with Conrad, sustained the fame of his race for treachery, and suffered the German forces to be cut to pieces by their Moslem foes. The French expedition was equally unfortunate, and, though a fragment reached Syria and laid siege to Damascus, the climate and vices of that region finished the destruction which the fortunes of war had begun. Mortified and dejected, as well by the conduct of his queen as by the ruin of his enterprise, Louis came back to his kingdom, bringing with him scarcely a tenth of the grand army which had departed. The weight of the blame was thrown upon the adviser of the ill-starred expedition, and Bernard, who had deprecated the evils and protested against the blunders of the campaign, was cursed in hall and cabin, by priest and prince, by widow and orphan, for its fatal result. His firmness had well-nigh given way under such reproaches. His evident error in judgment was treated as crime, and the fact that he had not accompanied the host seemed to testify against him. The fame of Bernard, tarnished by this disaster abroad, was retrieved by his successful warfare with new heresy at home. He cleansed Languedoc from the scandal which Henry of Lausanne and Peter of Bruiis, the Cathari, or Purist, leaders had brought upon that province. These men had inveighed against the vices of

the clergy, and proclaimed a return to the simple decencies of the gospel age. Bernard hated luxury in the priesthood, but he hated schism more; and the same voice which had protested against the persecution of Jews counselled the extermination of rebellious Christians. A rabbi could praise the good monk who had saved him from massacre, but numbers of men and women whose crime was that they exalted virtue above submission, were sent to death by the approval of this same monk. It is the darkest spot in Bernard's life. More pleasant is the story of his refutation, at the council at Rheims, in 1148, of the Sabellian bishop, Gilbert of Poitiers. Warned by the fate of Abelard, the heretic bishop found it expedient to save himself by judicious concessions. In vain, after this, did they try to engage Bernard in the preaching of a new crusade. His public life was finished. His last 5 years were passed in comparative retirement, varied only by literary occupations and the visits of distinguished friends. Guinard, king of Sardinia, and Pope Eugenius, were at different times his guests. The "burning and shining light of the Irish church," Malachi, saint and bishop, died on a visit to the home of his early friend, and it was Bernard's privilege to close the eyes and write the life of this dear brother in the faith. That biography established Malachi's right to sainthood. The abbess Hildegard, the marvel and the enigma of Christian Europe in all the 12th century, found in Bernard a friend who vindicated her at Rome, and believed that her gift of prophecy was real. In these last years the most remarkable of Bernard's compositions were written. But his physical powers were waning to their end. Early in 1158 a sickness attacked him, in which distress of mind aggravated his pains of body. His friend Eugenius had departed, with his other friends, before him, and he had no wish to live longer in a world so full of sin, and care, and sorrow. Sad words he dictated from his sick bed, telling the trial of his weary heart. Yet his faith did not fail, and he was ready for more service if the church had need of him. Summoned by the archbishop of Metz to heal a bloody feud which had arisen in his diocese, between the knights and the people, he rose from his bed, made a rapid journey of some 50 miles, and met the contending parties as they stood arrayed on either side of the Moselle. The nobles ridiculed the interference of this ghost, scorned his words, and laughed at the dream which he told them. But that very night the prophecy of peace which he left was fulfilled, the hearts of the knights were melted, and the *Gloria in excelsis* was chanted by the united hosts. This last effort was fatal. Bernard returned to his convent to die. At the age of 68, surrounded by his brethren, he breathed his last. His body was buried in the church at Clairvaux. He had been abbot 38 years. The public voice demanded his immediate canonization. In the year 1165, 12 years after his death, his name

was set in the calendar of the church by Pope Alexander, though, from the great number of candidates, it was not openly proclaimed among the saints until 1174.—Few men have better deserved this honor. Few have loved the church with more steadfast and unselfish devotion. Few have rendered to it more signal services. On his moral purity no stain rests. His stern integrity has never been doubted. He enforced upon others no rule to which he was not ready to conform, no duty which he was not ready to do. If he loved influence and was not insensible to praise, he compromised no principle, and he adopted no policy for the sake of power or applause. He was by nature loyal to tradition, and suspicious of novelty. Severe sometimes in his judgments of others, he was always severe in his judgment of himself. His temper was that of a champion and a ruler, but not of a despot. Skilled in diplomatic arts, he was yet intolerant of all temporizing or hesitation in the service of truth. The church knew him as a trusty servant, faithful to his profession, terrible to all its foes. Lacking that kindness of manner and that broad charity which made Peter the Venerable, of Cluny, the friend of the unfortunate, Bernard gained the ennobling reputation of guardian to the faith. No man of his age had a wider renown. No man of that age fills a larger place in its history. Bernard's reputation rests on 4 substantial grounds, his integrity and consistency of personal character, his remarkable executive ability, his eloquence as a preacher, and his affluence and skill as a writer. Of his personal character we have already spoken. In proof of his executive ability, apart from the fact that he was for a long term of years the virtual dictator of the church, we have the record of the monasteries which he founded or gathered, viz.: 35 in France, 11 in Spain, 10 in England and Ireland, 6 in Flanders, 4 in Italy, 2 in Germany, 2 in Sweden, 1 in Hungary, and 1 in Denmark. At Clairvaux at the time of his death, there were 700 brethren. Such organizing power was unprecedented in mediæval Christian history, and seemed to entitle Bernard to rank with Basil and Paul. It is not easy, at this distance of time, to measure Bernard's influence as a preacher and a writer. His treatises, authoritative as they still are, have been superseded by the works of Bellarmine and Aquinas, and his sermons do not justify or explain his singular fame for pulpit eloquence. It needs nice discrimination to separate his genuine writings from those which have been falsely attributed to him. Some of these latter are palpable forgeries; but some are close imitations of his style and manner. The genuine writings of Bernard may be divided into 8 classes: epistles, sermons, and treatises, moral and theological. Of the epistles 480 are contained in the collections of Mabillon and Martène, 439 of which were the work of Bernard himself, the remainder being either addressed to him or drawn up by his

secretary. These letters are addressed to 5 classes of persons: 1, to monks and abbots; 2, to archbishops, bishops, and secular priests; 3, to the pope and the various officials at the Roman court; 4, to princes, nobles, and statesmen; 5, to private individuals. The subjects of the letters are very various. Some are monastic, dwelling on the needs and the methods of cenobite life. Some are mystical, descending upon the doubts and struggles of the soul on its way to perfection. Some treat of the general principles of right and duty, some of particular applications of those principles. Many of the letters are concerned with matters of elections in the church, questions of disputed episcopal authority or fidelity. Many of them are political, many dogmatical, some highly polemic, and not a few purely complimentary and personal. Chronologically, the letters may be ranged into 4 series: the first covering 11 years, from 1119 to 1180; the second 8 years, from 1180 to 1188; the third 7 years, from 1188 to 1145; and the fourth the remaining 8 years of the writer's life. The general characteristics of all these letters are earnestness, energy, clearness of expression, and a fierce sincerity. One spirit breathes through them all. The style is unequal, in most instances rugged and harsh, quite lacking the grace which adorns the letters of Abelard. The efforts at wit are undignified, especially the occasional travesties of the sentences of the Scriptures. It may be said in mitigation of the judgment of Bernard's rough style, that the words of many of his epistles are not his own, that he furnished the thoughts to be clothed in words by his scribes. There are some in the collection, notably those addressed to Innocent and Eugenius, which are tenderly pathetic, and may pass as fine examples of this kind of composition. The sermons of Bernard, 340 in number, may be arranged into 4 classes: 86 on the Canticles of Solomon; 86 on the events of the ecclesiastical year; 48 on the saints and the virgin; and 125 miscellaneous. Most of them are short. The sermons on the Canticles exhibit Bernard's fondness for allegories, and his skill in extracting moral teaching from erotic and poetical description. They explain only the first 2 chapters of this book. Gilbert of Holland, about 25 years after Bernard's death, published a continuation of the series on the Canticles, bringing the work down to the middle of the 5th chapter. The sermons of Bernard cannot be regarded as eminent specimens of religious oratory. They are cold, ethical, sometimes even obscure. Written in Latin, they seem poorly adapted to make impression even upon those hearers to whom the Latin tongue was still intelligible. It is greatly to be regretted, that the sermons in the common tongue, by which Bernard was enabled to awaken such a mighty revival in Europe, have not been preserved to us, rather than the uninspiring and scholastic compositions which remain to attest his gifts as a preacher. The actual impressive-

ness of his preaching is paralleled only by the stories of the crowds in England and America which were moved and swayed by the appeals of Whitefield; while the written monuments of that preaching which survive seem, as in the case of Whitefield, wholly inadequate to such a result. The best sermons of the collection are the eulogies of departed brethren. Of the 12 treatises of Bernard, the first in time is entitled the "Twelve Degrees of Humility and Pride." This youthful treatise is very carefully drawn up, and the antitheses, though redundant, are often ingenious. The work on "The Love of God," seems to show that Bernard was not a believer in perfect disinterestedness of love. It is a logical and accurate treatise. The "Apology" is a severe polemic attack upon the disorders and extravagances of the monks of Cluny. The language is sharp and bitter. The treatise on "Grace and Free-will" is more subtle than thorough as a discussion of that subject. The treatise *De Conversione ad Clericos*, exposes the iniquities which had crept into the ecclesiastical life, and urges a reform. The "Exhortations to the Knights Templars," is a panegyric on that impetuous order of religious servants, with the anomaly of whose state Bernard's disposition and taste readily sympathized. Baptism and the Incarnation are treated in a work first addressed as a letter to Hugo St. Victor. Another treatise refutes the "Errors of Abelard." Another, on "Precept and Dispensation," answers interesting questions of monastic morality, and is still considered an excellent convent manual. The only biographical work of Bernard is his life of the bishop Malachi, which relates prodigies, and indulges equally in pious reflections and in harshness of censure. The last and most important of the treatises of Bernard is his work on "Consideration," suggested by the visit of Pope Eugenius to his monastery, and dedicated to that pontiff. It is in 5 parts. In the 1st, he insists upon the necessity of gaining and preserving the habit of religious meditation; in the 2d, he tells what a pope ought to be and to do; in the 3d, he deals with the relation of the nations of the earth to the papacy; in the 4th, he considers the officers and servants of the papal court; and in the 5th, he explains the relation of the pope to superior intelligences, to the angels, and to God. The writings of Bernard give us the idea of a patient and diligent scholar, working in a limited range of study. He knew well the letter of the Scriptures, but he quotes it chiefly from the Vulgate, and shows little acquaintance with the Greek or Hebrew text. Among the fathers, Augustine was his favorite, and his dogmatic system was a reproduction of that great master. A moderate knowledge of the classics, especially of Ovid, enables him to vary with occasional heathen fancies, the severe force of his argument and invective. He had the faculty of bringing in at the right time and place all his knowledge, and his singular memory enabled him to call up for practical

use illustrations which another would have lost. Yet he was able to assimilate his fruits of study, and no great doctor of the church seems less indebted to his culture for his influence. He was an original thinker, independent in his opinions, and his fresh strength makes the old views which he produces seem new and peculiar. In his case, a mind naturally imaginative was trained and disciplined to the exigencies of service in affairs and to the commanding restraints of established institutions and traditional truth. One would hardly be prepared to find in such a writer the talent of the hymnist, or to expect from such a source the stanzas of a Prudentius or a Gregory. Yet the works of Bernard have their appendix of anthology. The watchman of the church found leisure to be a poet. And among the most praised hymns of the Roman breviary is that long meditation upon the Saviour in stanzas of four-fold rhyme, *Jesu, dulcis memoria*, which has the charm of musical cadence, if it lacks the merit of correct Latinity.—The works of Bernard have been frequently republished. The standard edition is that of Mabillon, in 1690, in 2 vols. folio. This contains valuable notes, in addition to the edition of 1667. A new edition appeared in 1719 and in 1726. Another less valuable but more convenient edition, by the same famous Benedictine, is in 9 vols. 8vo. The biographies of Bernard, some of which descend most eloquently upon his power as a miracle-worker, which in this sketch has been left unnoticed, but which has been for ages and is still a source of the reverence in which as a saint he is held, leave nothing to be desired concerning his history. French, Italian, German, and English writers have made his life a special study. The most recent and accessible are the biographies of the abbé Ratisbonne (2 vols. Paris, 1846), Neander (Berlin, 1841), Montalembert, Daunon, in vol. 18 of "French Literary History," and Abel Desjardins (Dijon, 1845).

BERNARD, CLAUDE, a French physician and physiologist, born at St. Julien, in the department of Rhone, July 12, 1818. In 1834 he went to Paris, intending to pursue literature as a vocation, but not meeting with success, soon gave up the attempt, and devoted himself to the study of medicine. He has especially distinguished himself by his researches in comparative anatomy and physiology, and has been professor in the college of France during the last 10 years. He has made special studies of the liver and pancreas.

BERNARD, EDWARD, a versatile English scholar and divine, born May 2, 1688, near Towcester, in Northamptonshire, died at Oxford, Jan. 12, 1697. Distinguished for a rare knowledge of oriental languages and for his scientific attainments, he graduated with high honors at the university of Oxford, officiated in 1669 as deputy professor, and on Christopher Wren's retirement in 1678, as professor of astronomy, and finally in 1691, after having spent a year at Paris, as tutor to the children of

Charles II. by the duchess of Cleveland, he relinquished the astronomical chair, and became rector of Brightwell, in Berkshire. In mathematics he rendered himself especially useful at Oxford, while he left beside a great mass of unprinted matter, over 15 distinct scientific and theological publications and annotations on classical works. One of his most valued productions is on the subject of the ancient weights and measures; and the *Catalogus Manuscriptorum Angliæ et Hiberniæ*, prepared by him, and published in 1697, for the university of Oxford, is still used in that institution at the present day.

BERNARD, SIR FRANCIS, an English lawyer, governor of the American province of New Jersey, from 1758 to 1760, and of Massachusetts, from 1760 to 1769, died in London, July 1, 1818. It was his misfortune to preside over the latter province, and to be an advocate of the claims of the crown, and of coercive measures, in the period shortly preceding the outbreak of the American revolution. With no talent for conciliating, and no insight into the spirit which animated the people whom he governed, he fanned the discontent which the English ministry originated. He brought the troops into Boston, and prorogued the general court when it refused to make provision for their support. He secretly sought to undermine the constitution of the province, by changing its charter, so as to transfer the right of appointing the council from the general court to the crown. He was despised for his cowardice, duplicity, and avarice, and his letters to England show the readiness with which he distorted facts, and magnified trivial rumors into acts of treason. The house of representatives at length unanimously voted a petition to the king, humbly entreating that Sir Francis Bernard might be removed forever from the government of the province. He was recalled, and as he departed from Boston, the bells were rung, cannon fired after him from the wharves, and the liberty tree hung gayly with flags. The government, however, manifested its approbation of his course, by creating him a baronet. He was a man of erudition, had committed to memory the best passages of the best authors, and was a patron of Harvard college.

BERNARD, JACQUES, a French writer, born at Nyons, Sept. 1, 1658, died April 27, 1718. A minister of the reformed church, he fled to Holland upon the revocation of the edict of Nantes, and founded at the Hague a school for belles-lettres, philosophy, and mathematics. He continued the publication of the "Universal Library," which had been undertaken by Lelerc, and, in 1698, succeeded Bayle in editing the journal entitled the "Republic of Letters." He made a collection of the treaties of peace, truce, neutrality, suspension of arms, and alliance, and other international compacts in Europe from the time of Charlemagne.

BERNARD, JOHN, English actor, born at Portsmouth, 1756, died in London, 1830. He was an excellent light comedian, and had some

ability as a dramatic author. For many years he was joint manager of Plymouth theatre. His first appearance in London was in 1787, at Covent Garden theatre, as Archer in the "Beau's Stratagem," and was very successful. He was secretary for 9 years of the celebrated beef-steak club. In 1797 he appeared for the first time in the United States, at Birkett's circus (then fitted up as a theatre), Greenwich street, New York, as Goldfinch in the "Road to Ruin." He became one of the managers of the Boston theatre, in which capacity he continued for several years. Finally, he returned to England. His "Recollections of the Stage" (chiefly written by his son) relates his adventures up to the period (June, 1797) when he went to America. As he went on the stage in 1774, and quitted it in 1820, this period included exactly 28 years, or one-half of his theatrical career. The book, though full of anecdote, was not popular, and the second part, which was to have related Mr. Bernard's American experiences, never appeared.—WILLIAM BAYLE, son of the above, born at Boston, Mass., Jan. 1, 1808. He went to England with his father, and his first literary work of any importance, was the preparation for the press of his father's "Recollections of the Stage." Soon after this he commenced his career as a dramatic writer, and has supplied the London stage and actors with a quick succession of original plays, most of which have been as popular all over the United States as in England. Many of the pieces in which the late Tyrone Power made his most effective hits, were written by Bayle Bernard. Among his best known plays are "The Nervous Man and the Man of Nerve," "The Irish Attorney," "The Mummy," "His Last Legs," "Dumb Belle," "A Practical Man," "The Mid-dy Ashore," "The Boarding School," "The Round of Wrong," "A Splendid Investment," and "A Life's Trial." With the exception of Jerrold, no modern English dramatist has borrowed so little "from the French." Mr. Bernard's plots are well constructed, his leading characters distinctly individualized, and the *morale* of his incidents exemplary.

BERNARD, SAMUEL, a Parisian banker, born about 1651, died 1739. The son of an artist, he rose, by his financial abilities, to a position of great influence, and is said to have amassed a fortune of \$6,000,000. His services were put in constant requisition by the minister of finance, Chamillard, and his successor, Desmaretz, had more dealings with Bernard than with any other farmer of the public revenue in Paris. He was personally introduced to Louis XIV., and afterward to Louis XV., both monarchs deeming it prudent to treat their plebeian but powerful creditor with the utmost kindness and affability. Lending large amounts of money to poor officers and other insolvent parties, without the least prospect of return, he left the reputation of a man who made a skilful, but also a benevolent use of his means. His pecuniary ability was so great that he was supposed

to have been of Jewish origin, although he seems to have been born in the Christian faith. He was ennobled for his public services.

BERNARD, SIMON, French general of engineers, born at Dôle, April 28, 1779, died in Paris, Nov. 5, 1839, was educated by charity in his native town. He was appointed to the polytechnic school, whither he went on foot, and would have died of cold in the streets of Paris but for the care and kindness of a humble woman, who sheltered him and took him to his destination. At the school he profited greatly by the instructions of his masters, among whom were La Place, De Fleury, Fourcroy, and Monge, obtaining the second position in the class of engineering. He was appointed into the *corps de génie*, and first served in the army of the Rhine, in which he soon became a captain. The emperor having confided to him an important commission, he became his aide-de-camp, and during the 100 days was put at the head of the topographical bureau. He came to America with La Fayette in 1824, and while in this country he was made chief engineer of the army, in which capacity he rendered great service to the country. He left here as his monuments some admirable works, among them Fort Monroe, at the mouth of James river, in Virginia. Many of the defences of New York also date from his superintendence of the engineers. After the revolution of July he returned to France, and was made aide-de-camp of Louis Philippe. On Sept. 6, 1836, he became minister of war, having been previously made lieutenant-general of engineers. He remained in the ministry until the fall of the cabinet in April, 1837.

BERNARD, SIR THOMAS, an English baronet and philanthropist, born at Lincoln, April 27, 1750, died July 1, 1818. At an early age he went with his father to America, and was educated at Harvard college. He returned to England while still quite young, and was called to the bar in 1780. He married, in 1782, a lady who subsequently became sole heiress of a large property, and during the later years of his life, he devoted himself especially to philanthropic labors, and it was mainly through his exertions that, in 1796, a society for the purpose of improving the condition of the poor was founded in London. By his influence, also, a free chapel for the use of the poor was opened in the quarter of St. Giles, in that city, and the attention of the public was called to the sufferings of the laboring classes and the means of alleviating their miseries. He was also active in the efforts which led to the founding of the "Royal Institution," on the plan of the French academy, and the British institution for the purpose of collecting works of art.

BERNARD, ST., GREAT and LITTLE. See ST. BERNARD.

BERNARD LE TRÉVISAN, an alchemist of Padua, born in 1406, died in 1490, who flourished in society under the title of count de la Marche Trévisane, and who spent his life and

fortune in travels and investigations in search of the philosopher's stone, to the infinite satisfaction of the charlatans and adventurers who abounded in Italy in the 15th century, and who rejoiced in taking advantage of his scientific hallucination. His complete writings, in Latin and French, were published long after his death, in the 16th and 17th centuries, and, although all more or less connected with the philosopher's stone, they are not without some crude scientific theories about chemistry and heat, and were for a long time singularly popular with the adepts of alchemy.

**BERNARDIN, SAINT,** of Sienna, born at Massa, in Italy, Sept. 8, 1380, died at Aquila, in Abruzzo, May 20, 1444. He became a Franciscan friar, in a monastery near Sienna, in 1404, but desiring to make a pilgrimage to the Holy Land, was appointed a commissary of that country, and thus enabled to gratify his wish. After his return he acquired a great reputation as a preacher, and 8 cities were rival suitors for the honor of having him as a bishop. Bernardin, however, was unwilling to accept the distinction, and was made vicar-general of the friars of the Observantine order in Italy. He is said to have founded more than 300 monasteries. In 1450 he was canonized by Pope Nicholas V. His works appeared at Venice in 1591 in 4 vols. 4to. and at Paris in 1636, in 2 vols. folio. They consist of essays on religious subjects, sermons, and a commentary on the book of Revelations.

**BERNARDIN DE ST. PIERRE.** See **ST. PIERRE.**

**BERNARDINES,** monks or nuns of St. Bernard, a branch of the Cistercians, and hence allied to the great Benedictine order. In France the great fame of the Cistercian abbey of Clairvaux, and of its founder and first abbot, St. Bernard, led to the adoption of this name as the common designation of the whole Cistercian order. In Spain it is applied to a congregation of reformed Cistercians founded early in the 15th century by Martin Vargas, or Bargas, and approved by Pope Martin V. They had famous colleges at Salamanca, Alcalá, and elsewhere. In Italy, they owe their establishment to a bull of Pope Julius II., in 1511, by which all the Cistercians of Lombardy and Tuscany were erected into a separate congregation under the name of St. Bernard. In 1497, a bull to like effect had been issued, but soon after recalled, by Alexander VI. In process of time disorders grew up in the brotherhood, and a reform was undertaken about the year 1557, by John de la Barriere, abbot of Notre Dame des Feuillants, in France. Hence arose the Feuillants, who soon spread into Italy, and were there called reformed monks of St. Bernard. The Bernardines include several other reformed congregations, among which are the *Recollects*, the sisters of Providence, and the *sisters of the Precious Blood*.

**BERNARDO DEL CARPIO,** a popular hero in the romantic literature of Spain. He is said to have flourished at the beginning of the 9th cen-

tury, and to have been the offspring of a secret marriage between the count de Saldafia and the sister of Alfonso the Chaste. The king's wrath, on hearing of this marriage, knew no bounds. He doomed Saldafia to perpetual imprisonment and to cruel tortures, the infant was sent to a convent, while Bernardo was educated as the son of Alfonso and kept ignorant of his birth. The brilliant exploits of Bernardo, ending with the great victory over Roland at Roncesvalles—his heroic efforts to restore liberty to his father, when he learns who his father is—the treachery of Alfonso, who promises repeatedly to release the count, and as often breaks his word, with the despair of Bernardo, and his rebellion against the king and final flight to France, after Saldafia's death in prison, constitute the chief incidents in the hero's life, as represented in about 40 ballads and in the accounts in the "chronicle of Alfonso the Wise." Three plays of Lope de Vega are founded on the romantic career of Bernardo del Carpio, while the best epic on the subject, resembling Ariosto's *Orlando Furioso*, was published in 1624 by the poet Bernardo de Balbuena, under the title of *El Bernardo*.

**BERNAUER, AENEA,** celebrated for her romantic fate, died Oct. 12, 1435. She was the daughter of a poor citizen of Augsburg, of rare beauty and virtue, and captivated the heart of the young Albert of Bavaria, only son of the reigning duke, who met her at a tournament. She returned his love, and after a secret marriage, he conducted her to one of his castles. His enraged father, discovering this union by the son's refusal to form a more exalted matrimonial connection, caused him to be refused an entrance to the lists at a celebrated tournament at Ratisbon. The prince revenged this indignity, proclaiming Agnes duchess of Bavaria, and gave her a brilliantly appointed household; but, with a sad foreboding of her fate, she prepared a funeral chapel for herself in a neighboring convent. At the death of an uncle, who was tenderly attached to the young duke, the rage of his father broke forth, and by his orders, the beautiful young duchess, during the absence of Albert, was drowned in the Danube. The infuriated son took up arms against his father, and it was long before he could be appeased. At length he was induced to lay down arms, and to marry Ann of Brunswick, but during his lifetime he paid every honor to the memory of the unfortunate Agnes, and their loves have been the favorite subject of many Bavarian poets. Agnes has been made the theme of an opera, by Karl Kreba, which was for the first time performed at Dresden, Jan. 17, 1858.

**BERNAY,** a city of the French department of Eure, agreeably situated on the left bank of the Charentonne, 25 miles W. N. W. of the town of Evreux; pop. in 1856, 7,287. It is the seat of the greatest horse fair in France, attended by nearly 50,000 persons. It has cloth, woollen, linen, cotton, and paper manufactories,

tanneries, and bleacheries. Bernay has 2 fine old churches, a court of law, a tribunal of commerce, a communal college, a hospital, and interesting remains of mediæval architecture.

BERNBURG, capital of the German duchy of Anhalt-Bernburg, on the river Saale; pop. 10,000; divided into the old and new towns, with the suburb Waldau on the left bank and the Bergstadt on the right bank of the river, which is crossed by a stone bridge. It is the seat of the ducal court. The church of St. Mary is the finest of the 4 churches of the town, which has a gymnasium, a grammar school, a female high school, &c. The trade in corn, fruit, wine, earthenware manufactures, paper, sugar, copper, snuff, iron castings, &c., is stimulated by the branch of the Leipzig-Magdeburg railroad, which passes by Bernburg, on its way to Köthen.

BERNERS, JOHN BOURCHIER, lord, the translator of Froissart's "Chronicles," born 1474, died 1532, the eldest son of Sir Humphrey Bourchier, and related to the royal family through the duke of Gloucester, the youngest child of Edward III. Lord Berners made his début in the political world as member of the 11th parliament under Henry VII., but without any marked success. Under Henry VIII., with whom he was a great favorite, he became chancellor of the exchequer, and afterward governor of Calais. He wrote a comedy, *He in vainsam meam*, for the edification of those who attended the cathedral of Calais, where it was usually performed after vespers, and translated various foreign works; but his claims to the notice of posterity rest exclusively upon his translation of Froissart, with which he was charged by Henry VIII. The first volume appeared in 1523 and the second in 1525.

BERNERS, THE LADY JULIANA, an English lady of rank of the 15th century. It is not accurately known to what noble family she belonged, as her name is sometimes written Barnes; and as the lordship of Berners in the reign of Henry VIII. was in the family of Bourchier, which is, of course, the name of the cadets, male and female, of that house. The lady in question was the prioress of the nunnery of Sopewell, near St. Albans, in Hertfordshire; and was either the author or compiler of a work which has many claims to be considered among the most curious and interesting of mediæval literature. In the first place, it is one of the earliest productions of the English press, the first edition bearing date of 1481. In the second, it is to this day, on one of the subjects of which it treats, the art of falconry, or as it was called in old times, the "Mystery of Rivers," the recognized authority of scientific hawkers. The second edition was published in 1486, in the abbey of St. Albans, which probably had authority over, or some connection with, the nunnery of which the lady was prioress. It is entitled "The Boke of Hawkyng and Huntynge, wyth other pleasures dyverse, and also coot-armuries." The edition of 1481 has no treatises on coats-armorial or heraldry. The second is

embellished with a curious wood-engraving of a man angling, that ancient art being included in the "pleasures dyverse." It was afterward reprinted under the title of "The Boke of St. Albans," and became the most popular work, and the manual of field sports, for the space of several centuries. It was not in fact until the 18th century, when the improvement in fire-arms produced a complete change in the forms of hunting and fowling, that it was superseded, in general; although it still continues, as to all the branches of which it treats, and which still exist in their old method unaltered, to be the authority. Many editions were published during the 16th century, and in 1811 a small impression was reprinted as a matter of literary curiosity, by a Mr. Hazlewood.

BERNETTI, TOMMASO, an Italian cardinal and statesman, born at Fermo, Dec. 29, 1779, died March 21, 1852. He was one of the 18 cardinals who refused to attend the marriage of Maria Louisa and Napoleon, and who were called "black cardinals," as the emperor forbade them to wear purple. For 5 years he was detained in Rheims, and returned to Rome on the re-installation of Pius VII. in the Vatican. In 1826 Leo XII. sent him as nuncio to St. Petersburg; Jan. 29, 1827, the cardinal's hat was conferred on him; June 17, 1828, he succeeded Cardinal della Somaglia as secretary of state, and took a prominent part in the conclusion of the concordat with the Netherlands, June 18, 1827, and in the election of Pius VIII. to the Holy See. When the French revolution made itself felt in Italy, and the pope was obliged to call in the aid of the Austrian soldiery, Bernetti proposed the creation of a militia in order to obviate the expense connected with the engagement of foreign troops. This, however, gave offence to the Austrian government, which in 1836 prevailed upon the pope to dismiss the cardinal. When the revolution of 1848 broke out, he escaped from Rome in disguise.

BERNHARD, duke of Saxe-Weimar, one of the most distinguished generals in the 80 years' war, born at Weimar, Aug. 6, 1604, being the youngest of the 8 sons of Duke John of Saxe-Weimar, died at Neuburg on the Rhine, July 8, 1639. At the breaking out of the 80 years' war, he took part with the elector Frederic, king of Bohemia, against the emperor, and achieved great fame in the bloody battle of Wimpfen in 1621, in which Tilly was totally routed. In the autumn of 1623, he entered the Dutch service; in 1625 he assisted Christian, king of Denmark, in the war in Westphalia against Wallenstein, who, after the defeat of the Danish army, in 1628, reconciled him with the emperor. He was one of the first German princes who joined the party of Gustavus Adolphus on his landing, in 1631, in Germany, and distinguished himself in his service in Hesse and on the Rhine in 1632, and joined him in his attack upon Wallenstein's camp at Nuremberg in Aug. 1632. To the military genius of the

duke, the victory was chiefly due at the battle of Lützen, in which, however, Gustavus Adolphus was killed. He claimed from Chancellor Oxenstiern the command of the army and the dukedom of Franconia, and after some hesitation on the part of the Swedish statesman, he was eventually, in 1688, formally installed in this dignity, with the possession of Bamberg and Würzburg. In 1688 he took Regensburg; his attempts to penetrate into Austria were frustrated by Wallenstein, who, however, long weary of his allegiance to the emperor, made treasonable overtures to the duke; but Wallenstein was assassinated, Feb. 15, 1684, and was succeeded in May, 1684, in the command of the army, by the king of Hungary, afterward Ferdinand III., who took Regensburg in July, and totally defeated the Swedish army at the battle of Nördlingen in the autumn of the same year, the duke barely escaping with his life. Unwilling to accede to the peace of Prague, the terms of which were accepted by the majority of the German princes, after the victories of the imperial over the Swedish army, during the year 1685, the duke separated himself from the latter, and resolved to make a treaty on his own account with France. By the terms of this treaty, concluded at St. Germain-en-Laye, Oct. 27, 1685, he was to receive 4,000,000 francs yearly, on condition of furnishing a contingent of 12,000 foot and 6,000 cavalry, and of making a peace with the emperor and his allies without the consent of the king, a secret article securing to him a considerable additional pension, and the possession of Alsace. He was several times obliged to apply in person for the payment of the subsidies, which led to unpleasant personal collisions between himself and the French king. In 1687 he was appointed commander-in-chief of the French auxiliaries and of the German troops, achieving many victories in Lorraine, Burgundy, and Alsace, but for some time was unsuccessful in his attempts upon Swabia and Bavaria. In the latter part of 1688, however, he succeeded, after a desperate siege, in conquering Breisach, which he intended to make in future the centre of an independent principality in Germany. Richelieu, watching with Argus eyes the insatiable ambition of the duke, stopped the supplies, treating the conquest of Breisach as a French conquest made with French money and partly with French soldiers. The duke soon afterward died, as was supposed, by French poison. Crafty as he was, he was outwitted by the superior craft of the cardinal, who did not even respect his dying request in reference to the transmission of the duke's conquests to Germany; these the cardinal appropriated to France, by bribing the officers in command. The only privilege granted to his family was the permission of removing his remains to the vaults of the dukes of Saxe-Weimar, where he was buried in 1686.

BERNHARD, KARL, the pseudonym and recognized name of St. Aubin, one of the most excellent of Danish novelists. Many of his

works are included under the general title of "Pictures of Life in Denmark." He has also written 2 historical romances, "Christian VII. and his Court," and "Christian II. and his Times," and his last work, the "Chronicles of the Time of King Eric of Pomerania," is of a political character. With great power of observation, Bernhard excels in sketches of domestic life, and the delineations of Danish society, which is his principal theme, are both genial and humorous, and given in a very lively and elegant style.

BERNI, FRANCESCO, an Italian poet of the 16th century, born about 1490, of a poor but noble family, at Campo Vecchio, in Tuscany, died July 26, 1586, in Florence. He lived in the latter place in a state bordering on indigence, until the age of 19. He then determined to visit Rome, in the hope of receiving aid from the cardinal Bibbiena, his uncle. In this he was disappointed, and considered himself happy in obtaining the situation of private secretary to the chancellor of Pope Leo X. He now assumed the ecclesiastical habit. Gay and ardent, he sought relief from the austerity of his employer's household in the society of a circle of young ecclesiastics, who devoted themselves to good cheer, wine, pleasure, and poetry. His most celebrated work was the *Orlando Innamorato* of Bojardo, which he re-wrote entirely, correcting the style, and opening every canto with lines of his own. At the sack of Rome, in 1527, Berni lost all that he possessed. He retired to Florence, where he lived for some time, but at last was ruined by the friendship of Alessandro de' Medici, who wished to engage him to poison the cardinal Ippolito de' Medici. On his refusal, Alessandro put an end to his life by poison, in the fear that he might betray him.

BERNIER, FRANÇOIS, a French traveller and philosopher, born at Angers about the year 1625, died at Paris, Sept. 22, 1688. He first studied medicine, but his taste for travelling led him to Syria and also to Egypt, where he had the plague. He afterward went to India, and resided there for 12 years, during 8 of which he was physician to the emperor Aurungzebe. Under the protection of this prince and his ministers, with whom he became a great favorite, he was enabled to visit countries hitherto inaccessible to Europeans. On his return to France, he published his observations, and the information he had collected. A friend of Gassendi, and his most distinguished pupil, he made a summary of the writings of his master, and for the first time presented in French a luminous abridgment of the ideas of this rival of Descartes. He also aided Boileau in the composition of the famous *Arrêt burlesque*, which saved Aristotle and his doctrines from proscription by the parliament of Paris. Bernier was sometimes called the *joli philosophe*. Among his intimate friends were La Fontaine, Ninon de l'Enclos, and St. Evremond.

BERNIER'S ISLAND, an island off the W. coast of New Holland, in lat. 24° 50' S., and long

118° 5' E., near the mouth of Shark's Bay. It is formed of horizontal strata of sand and limestone, containing sea-shells, and is scantily supplied with vegetation.

**BERNINA**, a peak of the Rhetian Alps, in the canton of Grison, Switzerland, 86 miles S.E. of Chur, famous for its glacier. The pass of that name, between the upper Engadine and the Valteline, is elevated 7,672 feet above the sea.

**BERNINI, GIOVANNI LORENZO**, an Italian sculptor and architect, born at Naples in 1598, died at Rome, Nov. 28, 1680. When but 10 years old, he was introduced to the notice of Pope Paul V., who recommended him to Cardinal Barberini. He commenced by making busts of the pope and several of the cardinals, of extraordinary merit, but soon gave his attention almost exclusively to architecture, and during the pontificate of Urban VIII. executed the great altar of St. Peter's, the 4 colossal statues of saints, the belfry, and the circular place before the church, beside other works, which gained him honors and emoluments from the pope, as well as a European renown. Commissions flowed in upon him from all quarters; he designed numerous churches, palaces, and public buildings, executed a statue of Charles I. of England, and at the urgent request of Louis XIV., in 1666, travelled in great state to Paris, where he was received with honors seldom bestowed upon an artist, and where, during a residence of 8 months, he executed a bust of the king, and prepared several important architectural plans. His return to Rome was the occasion of another ovation, and during the remainder of his life he resided there, busily occupied in designing and executing great works. The facility with which he executed, and a certain brilliancy and quickness of invention and combination, doubtless explain the extraordinary estimation in which he was held; but that his style or works possess no substantial merit is certain, from the fact that they have never been deemed worthy of imitation by artists.

**BERNIS, FRANÇOIS JOACHIM DE PIERRE DE**, count of Lyons, cardinal and archbishop of Albi, born May 22, 1715, at St. Marcel, department of Ardèche, died at Rome, Nov. 1, 1794. He was of a noble and ancient, but not wealthy family, and was destined from childhood for the church. In 1735 he went to Paris, having first been appointed canon of Lyons. His pleasing countenance, graceful manners, gay and amiable disposition, together with a ready talent for making verses, soon gained him access to the best circles. He did not, however, obtain any substantial advantages, and his gay life prevented him from finding favor with Cardinal Fleury, and obtaining a benefice. He did not present himself at court until after the death of the cardinal, and then, through the favor of Madame de Pompadour, he was appointed ambassador to Venice. On his return, he was received at court with great considera-

tion, appointed member of his council by Louis XV., and charged with the duty of forming an alliance between France and Austria. The highest favors were the reward of his success. He was appointed minister of foreign affairs, and the king claimed for him the hat of a cardinal. The disastrous consequences of this treaty were, however, imputed to him, notwithstanding his reluctance to conclude it, and he was exiled in 1758 to Soissons, where he remained until 1764, when he was recalled, and elected archbishop of Albi. He received the appointment of ambassador to Rome from the court of France, in consequence of the ability he manifested in the conclave of 1769. The object of this embassy was the suppression of the Jesuits; a measure contrary to his own judgment. In consequence of refusing the oath to the new constitution, he was deprived of his clerical revenues, and reduced to destitution. Through the influence of a friend, he obtained a pension from the court of Spain, which was continued to his death. The light poetry of his youth, although it obtained for him the honor of being made member of the French academy, did him no credit; and even a poem, written later in life, and graver in style, was but little superior.

**BERNOULLI**, a name made famous by 3 mathematicians of the highest order, and 5 of a less distinguished rank. The family were driven from Antwerp by the bloody cruelties of Philip II., and took refuge first at Frankfurt, afterward at Basel, where **JAMES BERNOULLI** was born, Dec. 25, 1654. He was chosen professor of mathematics there, in 1687, and died Aug. 16, 1706. Elegant in his classical scholarship, and wonderful in mathematical genius, he was also a devout and conscientious man, and won the personal esteem of the savants of France, Holland, and England, during his visits to those countries. His fame rests chiefly on his application of Newton's and Leibnitz's calculus to the subject of curvature and curves, in which he made brilliant discoveries.—His brother **JOHN**, born July 27, 1667, died Jan. 1, 1748, pursued mathematical studies to his eightieth year, and then quietly fell asleep. In 1695 he was appointed professor of mathematics at Groningen, and, in 1705, succeeded his brother in the chair at Basel. Equal to his brother in mathematical power, and as sincere in his good purposes, he attained the highest scientific honors; and the only stain on his memory is from the capriciousness of his temper, which made him jealous and severe to some of his friends, although generous and tender toward others.—His second son, **DANIEL**, born at Groningen, Feb. 2, 1700, died at Basel, March 17, 1782, was the 3d mathematician of the family who attained the highest rank. At the age of 24, he was offered the presidency of a projected academy at Genoa, and the following year was appointed professor of mathematics at St. Petersburg. Returning to Basel, in 1733 (much to the regret of the court at St. Petersburg), he be-

came professor of botany and anatomy, and afterward of natural philosophy. He resigned his post in 1777, and died, like his father, in sleep. His fame rests on his ingenious and successful application of mathematics to questions of a mechanical nature, in astronomy, hydraulics, &c. He and his successor at St. Petersburg, Euler, stand alone in the number of prizes which they obtained from the academy of sciences at Paris.—His elder brother, **NICHOLAS**, born at Basel, Jan. 27, 1695, was appointed professor of mathematics at St. Petersburg, with Daniel, and died July 26, 1726.—**JOHN**, their brother, born at Basel, May 18, 1710, was professor of eloquence in that city 5 years, and in 1748 succeeded his father in the chair of mathematics; was a distinguished and successful mathematician, and died July 17, 1790.—His son, **JOHN**, grandson of the first John, was born at Basel, Nov. 4, 1744, died July 18, 1807. At the age of 19 he was appointed astronomer royal at Berlin. After extensive travels, during leave of absence, he was made director of mathematics in the academy. Before his death he had published valuable works on mathematics, and many other subjects.—His brother, **JAMES**, born at Basel, Oct. 17, 1759, died in St. Petersburg, July 8, 1789. At the age of 21 he assumed the duties of his uncle's professorship of natural philosophy. At 29 he was appointed professor of mathematics in St. Petersburg, where he married a granddaughter of Euler, and in 2 months after marriage died suddenly while bathing in the Neva.—The 5th of these Bernouillis of the 2d magnitude, **NICHOLAS**, was contemporary with the earlier of the first mentioned, a nephew of the first James and John; he was born in Basel, Oct. 10, 1687, and filled a professorship of mathematics at Padua (1716-'22), formerly filled by Galileo. Returning to Basel, he filled successively the chair of logic and that of law, and died Nov. 29, 1759.—**JEROME**, a member of the same family, born at Basel, in 1745, died in 1829, was distinguished as a naturalist and mineralogist. He was for a time president of the council of his native canton.

**BERNSTORFF**, **CHRISTIAN GÜNTHER**, count, a Danish diplomatist, born at Copenhagen, April 3, 1769, died at Berlin, March 28, 1835. After having been ambassador in Berlin and Stockholm, he was appointed minister of foreign affairs in 1797. He followed the policy of neutrality, and went on a diplomatic mission to London in 1801, but could not prevent a bombardment of Copenhagen by the English in 1807. He was ambassador to Paris in 1811, represented Denmark in the congress of Vienna, and signed the cession of Norway to Sweden in 1815. In 1818 he passed into the service of Prussia.—**JOHANN HARTWIG ERNST**, count of, a Danish statesman, called by Frederic the Great, "the oracle of Denmark," born in Hanover, May 13, 1713, died in Hamburg, Feb. 19, 1772. In 1782 he was Danish ambassador in Saxony, in 1787 at the imperial diet at

Ratisbon, in 1744 was sent to Paris, and in 1751 was prime minister. In 1770 he lost the favor of Christian VII., through the ascendancy of Struensee, was thrown out of employment, and retired to Hamburg. Having brought about the downfall of Struensee, he was recalled to Copenhagen, but died just before setting out.

**BERCEA**, a city of ancient Macedonia, lying south of Thessalonica, at the foot of Mount Bermus. It was founded, according to tradition, by the Macedonian princess Bercea. During the Peloponnesian war it was taken by the Athenians. After the battle of Pydna, it was the first to surrender to the Romans. Saint Paul preached the gospel here A. D. 49-65, and met with a reception which is commended in Scripture. Occupied by the Slavonians, and then by the Bulgarians, it was almost ruined by an earthquake in 904. In 1204, it formed a part of the Latin kingdom of Thessalonica. It fell under the power of the Turks in 1397, and during the middle ages became known by the name of Veria.

**BEROSUS**, a priest of the temple of Belus, 276 B. C. He wrote a history of Chaldea, cited by Josephus and other ancient writers. An edition of his fragments was published by Richter (Leipzig, 1825), and by Didot (Paris, 1848).

**BERRIEN**, a south-western county of Michigan, with an area of about 600 sq. m. It is drained by the St. Joseph's, Pawpaw, and Galien rivers, the first of which is here navigable for keel-boats. The surface is undulating and the soil of various qualities. Near the St. Joseph's it is remarkably fertile, and consists of a deep, black, sandy loam, overgrown with thick forests of hard timber. The agricultural products in 1850 amounted to 224,306 bushels of corn, 88,289 of wheat, 78,600 of oats, 59,158 of potatoes, and 6,165 tons of hay. There were 15 churches, 8 newspaper offices, and 4,082 pupils attending public schools. The Central railroad intersects the county. Pop. 11,417. Capital, Berrien.

**BERRIEN**, **JOHN MACPHERSON**, an American lawyer and statesman, born in New Jersey, Aug. 23, 1781, died at Savannah, Ga., Jan. 1, 1856. He was the son of an officer in the war of the American revolution, graduated at Nassau Hall in 1796, was admitted to the bar of Georgia at the age of 18, and gradually rose in reputation till he was ranked among the most able lawyers in the country. He was elected in 1809 solicitor of the eastern district of Georgia, became judge of the same district the next year, retaining the latter office till 1822, when he became a member of the Georgia senate, from which he was transferred in 1824 to the senate of the United States. He established in that body a high reputation as an orator and statesman, was appointed attorney-general of the United States in 1829, resigned this office in 1831 when Gen. Jackson's cabinet became inharmonious, resumed the practice of his profession in Savannah till 1840, when he was elected again to the na-

tional senate, and was reflected in 1846. He left a reputation for consistency and eminent ability in public life.

BERRY, a succulent fruit, having its seeds lying loosely among pulp. The gooseberry and the currant are genuine berries, but aloes and plums, hips and haws, are not admitted in this definition of a berry, by botanists, although commonly called berries in popular language. According to Prof. Lindley, a berry is a succulent or pulpy fruit, containing naked seeds; a pulpy pericarp or seed-vessel without valves, containing several seeds which have no covering but the pulp or rind; mostly round or oval.

BERRY, or BERRI, an ancient province of France, now forming the departments of Indre and Cher, together with a small part of Loire-et-Cher, Nièvre, Creuse, and Allier. It was divided into Le Haut Berry and Le Bas Berry, the former lying between the Cher and the Loire, and the latter S. W. of the Cher. Greatest length 100 miles; greatest breadth 90 miles. The chief rivers are the Loire, Cher, Indre, and Creuse, the banks of which are generally fertile, but elsewhere the land is either sandy, marshy, or covered with heaths. There is plenty of timber, good pasturage for cattle, and a superior breed of sheep. Coal, iron, ochre, marble, and building stone are abundant. Berry comprises the greater part of the territory anciently held by the *Bituriges Cubi*, who were styled by Livy, the chief people of Celtic Gaul, and are described as having been far advanced in civilization before the time of Christ. They were conquered by Cæsar, and remained under Roman rule until about the year 476, when their country was invaded by Euric, king of the Visigoths. Clovis united it to France in 507, and it was afterward governed by counts who took their title from Bourges, the capital city. Under Charles the Bald it became independent, and the title was made hereditary. The last count of Bourges, Eudes Arpin or Herpin, took the cross in 1094, and on his departure for Palestine sold the earldom to King Philip I., who made it an appanage of the princes and princesses of the blood. John the Good erected it into a duchy in 1360, and for a long period it was held by members of the royal family, although since the time of Henry IV., the title has been purely nominal. The last duke of Berry, the younger son of Charles X., was assassinated Feb. 18, 1820. During the religious and political disturbances which at different times have agitated the empire, Berry has generally borne a conspicuous part. In the Norman invasion, the wars against the English, and the religious struggles, it suffered greatly. In the great revolution of 1789 its losses were comparatively few, but in 1848 it was the theatre of considerable disorders.

BERRY, AGNES and MARY, two sisters celebrated for their relation with Horace Walpole, who met them in the winter of 1787, and who became fascinated by the varied attainments of the ladies. They were the daughters of a

Yorkshire gentleman of fortune, and distinguished alike for grace of person and beauties of mind. Mary, born in 1762, died Nov. 20, 1852, was an accomplished scholar. Agnes, the elder sister, died in May, 1851, was a proficient in the fine arts. The ladies were flattered by the statesman's attention, and although he was very advanced in years, they formed a Platonic attachment for the "forlorn antique of 71," which resulted in an interchange of letters, and in repeated visits which the 2 sisters paid to their veteran lover at Strawberry Hill. "Walpole," says an English critic, "was fond of his 2 wives, as he called them, would write and number his letters to them, and tell them stories of his early life, and what he had seen and heard, with ten times the vivacity and minuteness that he employed in telling similar stories to Pinkerton or Dalrymple." In 1797, the 2 sisters published, in connection with their father, an edition of Walpole's works in 5 vols. Mary Berry brought out in 1844 a collection of her own writings in 2 vols. 8vo, entitled "England and France," "Life of Rachel, Lady Russell," and "Fashionable Friends," a comedy. Subsequently she wrote a "Vindication of Macaulay's Character of Horace Walpole." The publication in 1840 of the letters of Walpole to herself and to Agnes, proved the most popular of their literary enterprises.

BERRY, CHARLES, duke of, the 8d son of Louis, dauphin of France, and of Maria Christina, of Bavaria, grandson of Louis XIV., born Aug. 31, 1686, died May 4, 1714. He was never noted, except for having married, when 24 years old, MARIE LOUISE ELIZABETH, of Orléans, duchess of Berry. This most notorious princess, daughter of Philippe, regent of France, born Aug. 20, 1695, died July 21, 1719. From her early youth, she indicated in her deportment and temper a strange combination of the profligacy of a courtesan with the pride of a royal princess. She had been married but a few months, when she threw off all restraints, and made herself conspicuous by the corruption of her morals in a court where corruption was the rule. Without entering into the details of her long series of love intrigues, which embrace persons of all ranks and nearly all ages, we are constrained to mention at least the most important in politics, and the most criminal in morals. One of the equerries of her husband, named Delahaye, seems to have been the first object of the brief, but impetuous passions, which more than once, it is said, found their satisfaction even among private soldiers. So utterly destitute of moderation was her love for Delahaye, that she proposed to run away with him. But the equerry prudently declined acceding to such a plan, and soon after, the duchess entertained new fancies, the best known and most important of which is her intrigue with Riom. This person was an officer of the guards, a nephew of that celebrated Lauzun, who, after the most extraordinary career, had married the great Mlle. de Montpensier. It seems that the

example of the uncle had inspired the nephew in more than one respect, for the latter began to treat his mistress even worse than the former had used his wife. In a word, the officer beat the princess, who found this discipline attractive enough to marry Riom secretly, as soon as she got rid of her husband. The duke of Berry died very suddenly at Marly, and the event gave rise to the most serious suspicions against the duchess. The intrigue with Riom was not in fact the only interest favored by the death of the duke. The incestuous intercourse between the duchess and her own father, the regent, was now no secret, being carried on publicly, to the scandal even of that licentious court. The memoirs of that time agree as to this revolting intrigue, into which the duchess had been led, less by an unnatural passion than by certain ambitious schemes, for the accomplishment of which she needed to exert an unbounded influence over the regent. Still, if she succeeded in the shameful means, she failed in the final result, and was never invested with that sovereign power which she so unscrupulously sought. Having been secretly confined, and being particularly anxious to conceal the fact, she offered to her father a great festival, in order to disconcert all suspicion. Scarcely able to leave her bed, she still exposed herself boldly to the fresh air of a spring night, and to the fatigues of a protracted entertainment. This last imprudence proved fatal. Being seized with fever, she left the illuminated gardens of Meudon to return to her bed, where she died soon after of pleurisy. She was then only 24 years old, but in so short a time, she had exhausted passions and practised vices enough to disgrace a century, "having never ceased," says St. Simon, "to combine with the tastes of a Messalina, the ambitious cares of a woman who felt herself called to govern men, without doubt because she despised them as much as they despised her."—CHARLES FERDINAND, duke of, 2d son of the count of Artois, afterward Charles X., and of Marie Thérèse, of Savoy, born in Versailles, Jan. 24, 1778, assassinated at Paris, Feb. 18, 1820. In 1789 he emigrated with his father, and for 9 years served in the army of Condé. In 1798 he went to Russia, but 8 years later he took up his residence in England, where he led a comparatively quiet and obscure life. There he married secretly an English lady, by whom he had 2 daughters. This marriage was afterward cancelled for political reasons, when the prince returned to France in 1814. He landed at Cherbourg, and at once produced a favorable impression. The abrupt frankness of his manners, and his military habits, won the sympathies of the people, and were even welcome with the army. He had the command of all the troops in and around Paris, with the title of colonel-general of the dragoons, but when Napoleon returned from Elba, he could do nothing but follow Louis XVIII. to Ghent, where he remained till after the battle of Wa-

terloo. On his second return to France the natural independence of his temper was unchanged. He kept aloof from all political coeries and intrigues, and after his marriage, the happiness of his home, the liberality of his ideas, as well as his freedom from all revengeful feelings, preserved him from these excitements. It was far more congenial to his temper to bestow a noble protection upon arts and literature. This contrast with the rest of his family had made him personally popular in France. The assassin, named Louvel, a fanatical Bonapartist, was employed as a saddler in the king's mews. He denied to the last having any accomplices, although the probabilities remained to the contrary. His actual motive, according to his own statement, was to strike to death the Bourbon dynasty in the person of its only member who could perpetuate the race. In fact, the duke of Berry had only one daughter, Louise of Bourbon, Mademoiselle, born Sept. 21, 1819, who was unable to succeed to the crown, by virtue of the Salic law. The unfortunate prince was leading his wife to her carriage at the door of the opera, when he was mortally stabbed in the right side. He was carried into a parlor belonging to the administration of the theatre, where he expired at 6 o'clock in the morning of Feb. 14, surrounded by his family, the high officers of the state, and the king himself. The last words of the victim were to ask pardon for his murderer, who had after all partially failed in his atrocious purpose, as the duchess was then in the second month of her pregnancy, and gave birth to a son 7 months afterward.

BERRY, MARIE CAROLINE FERDINANDE LOUISE, duchess of, daughter of Francis I., king of Naples, and of Maria Clementina, archduchess of Austria, born in Palermo, Nov. 5, 1798. When but little over 17 she was married by proxy to the duke of Berry, and soon after arrived in Paris, where she at once became popular by the generosity of her heart, the liveliness of her mind, and her fondness for art, literature, and pleasure, all qualities particularly congenial to the temper of the French people. As it happened that her husband had the same natural propensities, they lived together in mutual affection, but little troubled by political cares. On Sept. 21, 1819, she gave birth to a daughter, and, in the following year, she was pregnant when her husband was assassinated in the night of Feb. 18. Seven months after that dreadful event, she was delivered of a son, whose destiny seemed to be to succeed to the crown of France; but Providence had decided otherwise. In 1830, after a long parliamentary contest between the crown and the middle classes, the revolution of July broke out. In the midst of the bloody contest, conscious of her popularity, and well aware of the decisive influence that she might exert on the final result, she resolved to leave the Tuileries, and to go to the Hotel de Ville, the head-quarters of the insurgents. There she

intended to trust her son as their king to the loyalty of the people. This bold step might have changed the history of France, especially as several of the most influential citizens, dreading the consequences of a complete overthrow of the throne, were prepared to proclaim the young duke of Bordeaux as Henry V., and pacify the people, who had taken up arms at first more against an unpopular administration, than against the reigning dynasty. The duchess might thus have saved for her son the crown, which was falling from the head of the old king. But the blind obstinacy of the family destroyed this last chance. As the young duchess insisted with great energy on the execution of her design, and did not seem to be disposed to yield to moral opposition, the old king had recourse to material restraint. The mother of the presumptive heir of a tottering crown was put under arrest, and kept prisoner in her own apartments. Soon after, all was lost, and no other alternative was left to her but to follow the Bourbon family into exile. She did not remain long with them at Holyrood, where they took refuge, and, in the following year, she went to reside at Sestri, in Sardinia. From the very moment of leaving France she was resolved to return, and to attempt all means of restoring her son to the throne. The new government, in its unsettled condition between the yet powerful body of the legitimists and the fast-growing republican party, was specially uneasy about the threatening plots of the only member of the exiled family who had any claims on the popular sympathy, and showed energy enough to take advantage of it. By diplomatic pressure, they prevailed upon the king of Sardinia to expel the duchess from that country. Wounded in her feelings, but submissive to necessity, she went to Modena, where she was affectionately received, and thence to Rome, where she soon became the centre of active political intrigues. Those members of the legitimist party, who dreamed of a restoration by means of civil war, were busy around the duchess, whose ideas agreed but too well with theirs. Men of experience were not wanting who did their best to dissuade her from a rash enterprise of which the only possible result would be a useless waste of blood in Vendée and Brittany. Deceived by erroneous reports and groundless hope, she left Massa, April 21, 1832, and landed secretly on a point of the French coast, where she had to pass the first night in the open air, wrapped up in a cloak, without any followers but M. de Mesnard and M. de Bourmont. In the mean time, a movement attempted by her partisans in Marseilles failed entirely, and should have been a warning against any further step. Still, instead of reëmbarking, as she might have done without any serious difficulty, she resolved to seek in the west of France that fortune which she had not found in the south, and through imminent dangers and extraordinary incidents, she succeeded in reaching Vendée. Before

arriving at Montpellier, in order to escape arrest, she boldly presented herself to the mayor of the commune, who, she was informed, was a thorough republican. "Sir," said she, "I am the duchess of Berry; I am going to Vendée to try the chances in favor of my son. I know what are your political opinions; but I trust in your honor, and I come to ask you to assist me in continuing my journey." The answer was what the adventurous heroine had expected, and she entered the city in the wagon of the republican mayor, himself driving. She stopped one day in Toulouse, and made her entrance into Bordeaux in an open barouche by broad daylight. But to penetrate into Vendée, where she was more closely watched, she had to disguise herself in the garments of a peasant woman. Her first proclamation to call the legitimists to arms, issued in the name of Henry V., was dated May 19. She met immediately with a strong and decided opposition from many of the most influential men of the party. In Paris, especially, they disapproved this untimely insurrection against a government which had in hand all the means of suppressing it. Berryer, one of the most renowned among the leaders, waited on the duchess, and respectfully but earnestly insisted upon her desisting from the fatal enterprise. All was in vain. The insurrection, adjourned for a few days by a counter-order from Marshal Bourmont, broke out June 4, the very same day when the republican party made a similar attempt in Paris, and desecrated the funeral of Gen. Lamarque by bloody riots. The first fight of the legitimists in Vendée took place near Visille-Vigne, and is known as the *combat du chêne*. During the firing, and without fear of the bullets, the duchess who was on the spot attended to the wounded; but the odds were against her, and in the defeat of her followers, she was so near being taken prisoner, that it was only by exchanging her horse for M. de Charette's that she could escape. After the equally unsuccessful result of some other encounters in which her devoted partisans fought bravely, she gave up all hope of overthrowing or even endangering the established government, and sorrowfully confined herself to the care of her personal safety. Driven from place to place by the columns of troops on her footsteps in every direction, she took refuge in the city of Nantes, where she entered on a market day, as a country-woman, barefooted and carrying a basket of eggs and vegetables, followed at a distance by M. de Mesnard and Mlle. de Kersabiec. A safe asylum had been prepared for her in the house of 2 unmarried ladies of the name of Du Guigny, and there for the first time for many days, she could enjoy rest in spite of the efforts of the government to effect her capture. About that time a German renegade Jew, of the name of Deutz, presented himself to the ministers, and proposed a shameful bargain for the delivery of the proscribed duchess. By dint of base and hypocritical steps, he had previously succeeded

in being introduced to the duchess when in Rome, in the preceding year. He had obtained her protection and confidence by feigned religious and political devotion, and she had been imprudent enough to trust all her secrets to him, although it had been suspected, not without good reasons, that even then he was a secret agent of Louis Philippe. Whatever may have been his real character in Rome, he now appeared in Paris for the purpose of betraying his benefactress. Among the members of the cabinet, M. Thiers eagerly acceded to the proposals of Deutz, discussed the price of the treason, and when the bargain was concluded at 1,000,000 francs, according to some authorities, or, what is more probable, at half of that sum, according to some others, the traitor left for Nantes, in company with an agent of the secret police, of the name of Joly. So close had the transaction been kept, that nobody suspected it among the most distrustful friends of the duchess. Without any great difficulty, Deutz succeeded in ascertaining where she was; he was even admitted to visit her in her asylum, and at once gave all the information to the authorities. Suddenly the house of the Mlles. Du Guigny was surrounded by a large body of troops, dispersed in such a way as to prevent escape. The inside was invaded, searched with the greatest minuteness, and the duchess was not found. Still the most positive information left no doubt about her presence in the house at the time it was entered, and the possibility of escape was out of the question. For 86 hours every room, closet, and corner, was occupied by the soldiers, gendarmes, and policemen. The most liberal offers made to the 2 humble female servants of the Mlles. Du Guigny, to the extent of a table covered with gold, to tempt their fidelity, were of no avail, and the prefect announced his determination to destroy the entire house, stone by stone, rather than give up the pursuit. At last, 2 gendarmes posted in an attic room, having kept up a fire in the chimney to preserve themselves from the cold of an autumn night, heard to their utter astonishment a feminine voice ordering the fire to be put out, and announcing that the duchess of Berry was ready to surrender. There she had been in fact concealed with Mlle. de Kersabiec, M. de Mesnard, and M. Guibourg, 4 persons, in a space less than 4 feet long by 2 wide, in the angle of the walls behind the fire-place. This long and sharp trial she had borne with the most extraordinary bravery, endurance, and even gayety. As she was the last to crowd into the place, she found herself close by the hot iron plate of the chimney, and several times, half suffocated by the want of air, she had to extinguish with her own hands the flames communicated to her dress by the burning contact. She was at first imprisoned in the castle of Nantes, and subsequently transported to the citadel of Blaye. The royal court of Poitiers had already issued an indictment against the duchess to ap-

pear at the assizes of the department of Vendée. This was quashed without any legal authority, by her imprisonment without judgment in Blaye. In fact, it was neither more nor less than the actual restoration of the *lettres de cachet*, abolished by Louis XVI. The liberal legitimists and republicans were unanimous in protesting against the proceeding through all the channels of publicity, newspapers, magazines, and pamphlets. Numerous petitions were addressed to the chamber of deputies, which ought to have been the natural guardian of the public rights and protector of the law. A report was presented Feb. 5, 1838, and in answer to the reclamations founded on common justice, M. de Broglie, a minister of the *doctrinaire* school, put forward some general considerations of propriety and public tranquillity, and devised an indefinite rule of action from the circumstances. The chamber, apparently satisfied, passed to the order of the day. About that time rumors began to circulate, first among the people, and soon after in the press, to the effect that the prisoner of Blaye was pregnant, and even near her confinement. The most violent discussions arose at once everywhere in France, and soon led to many duels, which an insignificant although official report from Messrs. Auvity and Orfila as physicians, sent to Blaye by the government, did not silence. What Louis Philippe and his cabinet wanted was to publicly disgrace the duchess, and for this purpose no means seemed unworthy. Col. Chousserie, a brave and gentlemanly old soldier of Napoleon, who at first had the command of the citadel, tendered his resignation rather than obey his private instructions, which he thought utterly incompatible with his honor as a soldier and his delicacy as a man. Gen. Bugeaud, however, attempted the part refused by his predecessor, and so devotedly performed it that on Feb. 23, the ill-treated princess, in order to escape incessant persecutions, signed the following declaration: "Urged by circumstances, and by the measures ordered by the government, although I had the most serious reasons for keeping my marriage secret, I owe it to myself and to my children to declare, that while in Italy, I secretly married the count of Lucchesi-Palli, one of the princes of Campo-Franco." This document was immediately published in the *Moniteur*. A loud cry of indignation from all sections of the opposition answered to this act of coercion. Fresh protests were presented to the chamber of deputies, but were rejected by the majority. Nor did the declaration suspend the work of the tormentors, till on May 10, the duchess gave birth to a daughter, when the presence of all the public officers as witnesses was forced upon her by Bugeaud, the ever unscrupulous soldier, whose ambition contemplated only the future reward promised to his zeal.—So ended the political career of the duchess of Berry. June 8, she was set at liberty, as illegally as she had been put in prison,

and a French frigate transported her to Palermo. This episode of modern history had a worthy epilogue but 2 days after the departure of the duchess. A violent discussion arose in the chamber of deputies, when M. Thiers, mounting the tribune, made the following bold declaration: "We are accused of having violated the common law. I confess it. The arrest, the imprisonment, the release, all has been illegal. Well, where is then the excuse for our conduct? It is in the very frankness of our conduct." The majority applauded. From that time the duchess of Berry has lived retired from the political arena, and has confined herself to the quiet enjoyments of domestic life with her husband, the count Lucchesi, who has since inherited the title of Duke Della Grazia, surrounded by 4 children born of her second marriage, exclusive of the one that died soon after her release from Blaye. She resides part of the year in Venice, where she owns the beautiful Vendramin palace, and part of the year in her princely castle of Brunsee, in Styria. The concourse of friends who visit her constantly, proves that even after so many years, she is still popular among many of the French people, who either admire the heroic qualities displayed by her as the mother of a pretender, or sympathize with the womanly graces characteristic of her private life.

BERRYER, ANTOINE PIERRE, a French advocate and politician, born in Paris, Jan. 4, 1790. The political trials which took place after the second restoration brought him into public notice. He aided his father and the elder Dupin in the useless defence of Marshal Ney, while he alone was intrusted with that of Cambronne and Debelle. The former was acquitted; the latter having been sentenced to death, the young advocate went to the king, and succeeded in obtaining his pardon. His practice became extensive, and in 1830 he was elected deputy from the department of Haute Loire, and took a conspicuous part in the debates preceding the revolution of July. After the flight of Charles X., Berryer, in opposition to all the members of his party, retained his seat, in the chamber of deputies, where, though the only remaining representative of the fallen monarchy, he supported the most liberal measures. In 1832, when the duchess of Berry came to France to raise a rebellion among the Vendéans, he went to the princess to dissuade her from it. He was arrested as an accomplice in the undertaking he had opposed; but the charge was abandoned. In 1836 he strenuously but vainly opposed the restrictive measures of the government. On the question of voting 25,000,000 francs, to satisfy the claims of the United States, he made a powerful and successful speech against the bill. He held his position as leading orator in the assembly till the fall of Louis Philippe. Being elected to the constituent and legislative assemblies, he did not hesitate to manifest openly his monarchical predilections, and declare that a

republican system of government was entirely repugnant to the interest, manners, and traditional opinions of the French nation. He opposed the government of Louis Napoleon; and on the *coup d'état* of 1851, was vehement in denouncing him as a usurper. Since then, he has abandoned politics for the law. He was elected to the French academy in 1852. We must add the fact, that Berryer is a spend-thrift; and that, notwithstanding the profits of his large practice, he has been several times under the necessity of accepting large sums of money, contributed by his party, to relieve him from pecuniary difficulties.

BERSERKER (Scand. *ber*, bare, and *serkr*, a coat of mail), in Scandinavian mythology, a descendant of the eight-handed Starkader and the beautiful Alphilde. He was a mighty warrior who fought without coat of mail or helmet, contrary to the custom of his time. His rage supplied the place of armor, whence his name. He married the daughter of king Swafuram, whom he had killed in battle, and had by her 12 sons, as ferocious as himself.—The name was also applied to the possessed champions of the ancient Scandinavians. There is something extraordinary and incomprehensible in what is related of these persons, in some respects analogous to what we read in the Holy Scriptures concerning the *εμψυχομενοι*, or possessed of devils, to the understanding which neither experience nor science furnishes any clue. These Berserkers were persons, who at times were liable to uncontrollable fits of martial frenzy, during the occurrence of which they could perform the most extraordinary feats of strength and agility, far beyond their ability to attempt at any other period. They foamed at the mouth, bit through iron shields, broke maces of iron with their bare hands, snapped spears and sword-blades like pipe-stems or pieces of glass, set assaults, tortures, and even mortal wounds at defiance, and, if not invulnerable, appeared to be exempt from death, until at least the moment when the fit, or whatever it was, passed away; when they were not only as other men, but were so exhausted, so entirely prostrated and debilitated by the effects of the reaction, that they could be managed and controlled by a weak woman or an infant. Whether it was merely an abnormal state of excitement produced by the maddening effects of excessive drinking, and by stimulating the nerves by howling and frantic exercises into a semi-cataleptic state, like that superinduced by the orgies of the howling and dancing dervises; or whether it was some unknown nervous seizure, rendering for the moment the mind impassive to fear and the muscular body insensible to pain, is not now to be ascertained; but it is clear from all the accounts of contemporaneous writers, who mention it as a thing of course, and as no subject for wonder, that it was neither an exaggerated account of ordinary occurrences, nor an invention of the priests and apostles of a false religion.

BERTAUT, a French violoncellist, whose Christian name has not been preserved, and whose family name also is uncertain, being spelled by some Berthaut, and by others Bertault, the first who raised the instrument to the dignity of a science in France, born at Valenciennes at the beginning of the 18th century, died 1756. He possessed a fine voice and excelled upon the violoncello. His manner of performing upon this instrument was diffused over France by his pupils, Cupis, Duport the elder, and the two Jansons. When Bertaut did not sing or play upon the violoncello, he paid homage to Bacchus, and frequently his exploits in that department interfered with the full development of his musical genius.

BERTHA, a legendary name derived from the *Berchta* and *Perahia* of pagan times, and applied to celebrated women of the middle ages, as, for instance, St. Bertha, the beautiful and pious daughter of King Charibert of Paris, married in 560 to Ethelbert, king of Kent, whom she converted to Christianity, and, on account of her missionary services among the Anglo-Saxons, canonized by the see of Rome, which fixed her anniversary upon July 4. Again, we find in the poetry of the middle ages, a lady of the name of Bertha, or "Berthrada with the large foot," as with more truth than gallantry she was called, who figured as the daughter of Count Charibert of Laon, wife of Pepin the Small, and mother of Charlemagne. In 1822, Mr. Paulin Paris discovered an old poem, of which this lady (who died at Choiseul, July 12, 783, and was buried at St. Denis) was the theme, and which bears the title of *Berte aus grans pies*. A sister of Charlemagne, who married Milo d'Angleris, and became the mother of Roland, also appears in the poetical literature of the day under the name of Bertha. But the most celebrated among the Berthas was the daughter of Burchard, duke of the Allemanni, and queen of Rudolf II., the king of Swiss Burgundy, who, after his death in 937, was regent during the minority of her son Conrad, and subsequently married King Hugo of Italy. Queen Bertha, who died toward the end of the 10th century, was, like her namesake the old pagan divinity Berchta, a singularly thrifty housekeeper, and is represented upon monuments, coins, seals, as sitting upon her throne with a distaff in her hand. It is probable that, with the spread of Christianity, pagan emblems were in this manner transferred upon Christian monuments; but there is no doubt about the fact that many high-bred ladies of the 10th century were much addicted to household duties. Whenever Italians wish to express in a strong manner their regret at the changes which have come upon something good in the past, they say: *Berta non fila piu*; and the Germans' less pointed and laconic proverb, *In der guten alten Zeit, wo die Königin Bertha spann*, comes in the same manner from good Queen Bertha and her love for the distaff.

BERTHELDORF, a village of Saxony, 18

miles S. E. of Bautzen, where the central conference of the sect of Herrnhuter Christians is held.

BERTHIER, a western county of Canada E., with an area of 9,590 sq. m. It borders on the St. Lawrence, and is drained by Assumption river. In its N. E. part is Lake Maskinonge, a sheet of water about 4 miles long and 3 miles wide. A river of the same name rises in this lake and flows into the St. Lawrence. In 1852 Berthier produced more flax, oats, and tobacco, than any other county of Canada E. These productions, together with fabrics of wool and linen, form its chief staples. Pop. 84,608; chief town, Berthier-en-Haut.

BERTHIER, FERDINAND, a deaf mute, eminent as a teacher and author, was born at Louhas, near Macon, department of Saône et Loire, France, about 1801. He entered the national institution for deaf mutes, at Paris, at an early age, and was a pupil of M. Laurent Clerc. He was while quite young appointed an instructor there, and has risen from one position to another till he is now the dean of the institution, and one of the most eminent teachers of the deaf and dumb on the continent. He has written a very interesting memoir of the abbé de l'Épée, as well as several other works.

BERTHIER, LOUIS ALEXANDRE, marshal of France, prince and duke of Neufchâtel and Valengin, prince of Wagram, born at Versailles, Nov. 20, 1758, murdered at Bamberg, June 1, 1815. He was educated as a soldier by his father, the chief of the corps of topographical engineers under Louis XVI. From the topographical bureau of the king, he passed to active service, first as lieutenant in the general staff, and subsequently as a captain of dragoons. In the American war of independence he served under Lafayette. In 1789, Louis XVI. appointed him major-general of the national guard of Versailles, and on Oct. 5 and 6, 1790, as well as Feb. 19, 1791, he did good service to the royal family. He perceived, however, that the revolution opened a field for military talents, and we find him, in turn, the chief of the general staff under Lafayette, Luckner, and Oustine. During the reign of terror he avoided suspicion by exhibiting zeal in the Vendean war. His personal bravery at the defence of Saumur, June 12, 1795, secured an honorable mention in the reports of the commissaries of the convention. After the 9th Thermidor, he was appointed chief of the general staff of Kellermann, and by causing the French army to take up the lines of Borghetto, contributed to arrest the advance of the enemy. Thus his reputation as a chief of the general staff was established before Bonaparte singled him out for that post. During the campaign of 1796-'7, he also proved himself a good general of division in the battles of Mondovi (April 22, 1796), Lodi (May 10, 1796), Codogno (May 9, 1796), and Rivoli (Jan. 14, 1797). Of a weak character, of a tenacious activity, of a herculean strength of constitution, which allowed

him to work during 8 consecutive nights, of a stupendous memory for every thing respecting the details of military operations, such as movements of corps, number of forces, cantonments, chiefs; of a promptitude always to be relied upon, orderly and exact, well versed in the use of maps, with an acute appreciation of the peculiarities of the ground, schooled to report in simple and lucid terms on the most complicated military movements, sufficiently experienced and quick-sighted to know on the day of action where to deliver the orders received, and himself attending to their execution, the living telegraph of his chief on the field of battle, and his indefatigable writing machine at the desk, he was the paragon of a staff officer for a general who reserved to himself all the superior staff functions. Despite his remonstrances, Bonaparte placed him, in 1798, at the head of the army destined to occupy Rome, there to proclaim the republic, and to take the pope prisoner. Equally unable to prevent the robberies committed at Rome by French generals, commissaries and purveyors, and to arrest the mutiny in the French ranks, he resigned his command to the hands of Massena, and repaired to Milan, where he fell in love with the beautiful Madame Visconti; his eccentric and lasting passion for whom caused him during the expedition to Egypt to be nicknamed the chief of the *faction des amoureux*, and cost him the best part of the 40,000,000 francs successively bestowed upon him by his imperial master. After his return from Egypt, he seconded Bonaparte's intrigues on the 18th and 19th Brumaire, and was appointed minister of war, a post he occupied till April 2, 1800. Acting again as chief of the general staff during the second Italian campaign, he contributed somewhat to the apparently false position in which Bonaparte had placed himself at Marengo, by crediting false reports as to the route and position of the Austrian army. After the victory, having concluded an armistice with Gen. Melas, he was employed on several diplomatic errands, and then reinstated in the war ministry, which he held till the proclamation of the empire. He then became completely attached to the person of the emperor, whom, with the title of major-general of the grand army, he accompanied as chief of the general staff during all his campaigns. Napoleon showered titles, dignities, emoluments, pensions, and donations upon him. May 19, 1808, he was created marshal of the empire, grand cordon of the legion of honor, grand huntsman of France. Oct. 17, 1806, he had the honor of stipulating with Mack the terms of the capitulation of Ulm. From the Prussian campaign of 1806, he carried home the dignity of sovereign prince of Neufchâtel and Valengin. In 1808 he was ordered to marry the princess Elizabeth Maria of Bavaria-Birkenfeld, the king of Bavaria's niece, and was made vice-constable of France. In 1809, Napoleon placed him as general-in-chief at the head of the grand army destined to

operate from Bavaria against Austria. On April 6 he declared war, and on the 15th had already contrived to compromise the campaign. He divided the army into 8 parts, posting Davoust with half of the French forces at Regensburg, Massena with the other half at Augsburg, and between them, at Aversberg, the Bavarians, so that by quickly advancing, the archduke Charles might have vanquished these corps singly. The slowness of the Austrians and the arrival of Napoleon saved the French army. In his more congenial functions, however, and under the eyes of his master, he rendered excellent service in this same campaign, and added to his long list of titles that of prince of Wagram. During the Russian campaign he broke down even as chief of the general staff. After the conflagration of Moscow he proved unable even to interpret the orders of his master; but in spite of his urgent request to be allowed to return with Napoleon to France, the latter ordered him to stay with the army in Russia. The narrowness of his mind and his devotion to routine were now fully illustrated in the midst of the fearful odds against which the French had to struggle. True to his traditions, he gave to a battalion, sometimes to a company of the rear-guard, the same orders as if that rear-guard was still composed of 80,000 men; assigned posts to regiments and divisions which had long ceased to exist, and, to make up for his own want of activity, multiplied couriers and formulas. During the years 1813-'14 we find him again at his usual post. After the deposition of Napoleon had been proclaimed by the senate, Berthier, under false pretences, slunk away from his patron, sent in his own adhesion to the senate and the provisional government, even before Napoleon's abdication, and proceeded, at the head of the marshals of the empire, to Compiègne, there to address Louis XVIII. in the most servile language. On June 4, 1814, Louis XVIII. created him peer of France, and captain of a company of the newly established royal guard. His principality of Neufchâtel he resigned to the king of Prussia in exchange for a pension of 84,000 florins. On Napoleon's return from Elba, he followed Louis XVIII. to Ghent. However, having fallen into disgrace with the king in consequence of the concealment of a letter received from Napoleon, he withdrew to Bamberg, where, June 1, 1815, he was killed by 6 men in masks, who threw him out of one of the windows of his father-in-law's palace. His memoirs were published in Paris in 1826.

BERTHOLD, the second apostle of Christianity in Livonia, born in the first part of the 12th century, and killed in 1198 in a skirmish with the natives of Livonia, whom he endeavored, after his arrival at Yxküll, on the Düna, the head-quarters of the first Livonian Christian community, to convert to Christianity, first by amicable theological means, and as these had not the desired effect, by military exertion, in

which he was assisted by the crusaders of lower Saxony.

**BERTHOLD VON REGENSBURG**, a German missionary preacher, born at the beginning of the 18th century, died Dec. 18, 1272, and buried in the Franciscan convent at Ratisbon, of which he was a member. From 1250 to the close of his life, he preached to immense congregations of 60,000 to 100,000 persons, in Switzerland, Hungary, Austria, Moravia, Bohemia, Saxony, Swabia, &c., speaking to them from the summits of mountains or from the tops of trees. In the Heidelberg university library some MSS. of his sermons are preserved, and a portion of them was published by Kling of Berlin in 1824. The eloquent manner with which he exposed the iniquities of his times seems to have produced an electric effect upon his hearers. Near Glatz, in Silesia, a tent under which he had preached was exhibited long after his death, and revived the feelings of affection and reverence in which his name is held by the people.

**BERTHOLLET**, **OLAUDÉ LOUIS**, chemist, born Dec. 9, 1748, at Talloire, near Annecy, in Savoy, died at Paris, Dec. 6, 1822. He received his early education at Chambéry, and subsequently entered the university of Turin, where he obtained his diploma as doctor of medicine. Soon after he went to Paris, and made the acquaintance of Mr. Tronchin, a medical practitioner of some eminence, and a native of Geneva. Through the influence of Dr. Tronchin, Berthollet was appointed physician to the duke of Orleans, and while holding this appointment he applied himself diligently to the study of chemistry. He soon became advantageously known by his "Essays" on this branch of science, and in 1781 was elected a member of the French academy of sciences. Some years later, the duke of Orleans procured for him the office of government commissary and superintendent of dyeing processes—a position previously held by Macquer. To this appointment chemistry is indebted for his work on the theory and practice of the art of dyeing, which is much superior to any thing of the kind ever published before. In 1785, Berthollet, at a meeting of the academy of sciences, announced his belief in the antiphlogistic doctrines propounded by Lavoisier, in opposition to the phlogistic theory, then in vogue, and he was the first French chemist of celebrity who did so. He differed from Lavoisier, however, on one point: not admitting oxygen to be the acidifying principle, he cited sulphuretted hydrogen as a compound possessing the properties of an acid; and the justness of Berthollet's views has been confirmed by the discovery of other acids, into the composition of which oxygen does not enter. During the same year he discovered the composition of ammonia, and published his first essay on dephlogisticated marine acid, now called chlorine, proposing the use of it in the process of bleaching, a suggestion which has been extensively applied in

practice. When the French revolution involved the country in war, saltpetre, which had been largely imported for the manufacture of gunpowder, became very scarce, owing to the difficulties of importation. In this emergency Berthollet visited almost every part of France for the purpose of pointing out the means of extracting and purifying the salt from the natural resources of the land. He was also engaged with other men of science in teaching the processes of smelting iron and converting it into steel, which processes were then but little known in France. In 1792 he was appointed one of the commissioners of the mint, and, in 1794, a member of the commission of agriculture and arts, and professor of chemistry at the polytechnic and normal schools. In 1795 he became a member of the newly organized institute of France, and in the following year he was appointed by the directory to proceed to Italy with Monge, to select works of art and science for the French capital. On this occasion he became acquainted with Gen. Bonaparte, and was led to join the expedition to Egypt, where he took part in the formation of the institute of Cairo, the memoirs of which body were printed in one volume in 1800. In conjunction with Lavoisier, Guyton de Morveau, and Fourcroy, Berthollet planned and proposed a new and more philosophical system of chemical nomenclature, which, notwithstanding many imperfections incident to the incipient stage of all improvements, has been very useful to chemical science. He was the author of more than 80 scientific papers, some of which were inserted in the memoirs of the academy, and others were printed in the *Annales de chimie*, *Journal de physique*, and the *Mémoires de physique et de chimie de la société d'Arcueil*, so called from the place where Berthollet lived, the meetings of the society being held at his house. In some of the first memoirs published by Berthollet on sulphuric acid, on the volatile alkali, and the decomposition of nitre, he adopted the phlogistic theory; but subsequently, in a paper on soaps, he showed that they are chemical compounds, in which the oil, by combining with the alkali, acts the part of an acid. Berthollet was the discoverer of the ammoniuret of silver, commonly called fulminating silver. He also first obtained hydrate of potash in a state of purity, by dissolving it in alcohol. In 1808 he published his *Essai de statique chimique*, in which he attempts to confute the opinion of Bergman with regard to the nature of chemical affinity. Sir Humphry Davy in his "Elements of Chemical Philosophy," gives a synopsis of the views of Berthollet on this point, and shows them to be incorrect. In a controversy with Proust, Berthollet maintained that inorganic bodies are capable of combining in all proportions; but the views of Proust have been since corroborated by the doctrine of definite proportions.—On his return from Egypt, Berthollet was made a senator by the first consul Bonaparte, and afterward grand

officer of the legion of honor and grand cross of the "order of reunion." He was created count by the emperor Napoleon, and after the restoration of the Bourbons he was made a peer of France, though not by birth a Frenchman. These high distinctions did not affect the studious and simple mode of life of Berthollet; and being obliged to adopt armorial bearings, he selected the simple figure of his faithful dog. The latter years of his life, however, were embittered by the misconduct of his son, M. Amedée Berthollet, who had already distinguished himself by his chemical researches, but was ruined by dissipation, and finally committed suicide. The shock, no doubt, affected the health and spirits of the father, who, in 1822, was attacked with a fever, which was followed by a number of boils and a gangrenous ulcer of large size. He knew, as a physician, the extent of his danger, and bore with fortitude the sufferings which during several months exhausted his remaining strength.

BERTHOUD, FERDINAND, a Swiss writer on watchmaking, born in Neuchâtel, March 19, 1725, died near Montmorency, June 20, 1807. Intended at first by his parents for an ecclesiastic, his mechanical skill and tastes gained him permission to learn the art of watchmaking. He went to Paris in 1745, where he quickly excelled in his art, especially in the construction of chronometers, in which he surpassed all rivals. He twice visited London, wrote various books upon topics connected with his labors, was a member of the institute of France, and of the royal society of London, and a chevalier of the legion of honor.

BERTIE, a county of North Carolina, at the western extremity of Albemarle sound, bounded on the E. by the Chowan and on the S. by the Roanoke river, and drained by the Cashie. Area, 900 sq. miles; pop. 12,851, including 7,194 slaves; capital, Windsor; surface, flat; soil, fertile; chief staples, Indian corn, cotton, sweet potatoes, and hay. Productions in 1850, 762,563 bushels of Indian corn, 94,836 of sweet potatoes, 1,810 bales of cotton, and 3,566 tons of hay. There were 6 corn and flour mills, 4 saw-mills, 7 tar and turpentine distilleries, and 16 churches. Value of real estate in 1857, \$1,719,919.

BERTIN, the name of a family distinguished in French politics, journalism, arts, and letters. I. LOUIS FRANÇOIS the elder, the founder of the *Journal des Débats*, born in Paris, Dec. 14, 1766, where he died, Sept. 18, 1841. He was intended for the pulpit, but the revolution made him a journalist. In 1793 he formed a connection with the *Journal Français* and the *Courrier universel*, and in 1795 the *Eclair* became his principal means of combating the excesses of the revolutionary party. After the 18th Brumaire, the conservative party had no influential organ except the *Mercur de France*. Bertin felt that the time was propitious for the foundation of a new and powerful journal, and, purchasing from the printer Baudouin, for 20,000

francs, his patent for an advertisement paper, he founded the *Journal des Débats*, the first number of which appeared Jan. 20, 1800. But under the Argus eyes of Napoleon an independent political character was impossible for any journal, and Bertin gave to his a scientific and literary tendency, employing as writers men like Chateaubriand, Royer-Collard, Dus-sault, Feletz, and Geoffroy. Yet, careful as he was, he gave umbrage to the emperor, and, in 1800, he was accused of royalistic conspiracies and confined for 9 months in the Temple, from which place, however, he continued to edit the *Débats*, which had already acquired considerable influence. Toward the end of 1801 he was exiled to Elba, and after effecting his release he was allowed, on his return to Paris, to resume his connection with his paper, but only under the control of the government, which changed the name from *Journal des Débats* to *Journal de l'Empire*, and imposed upon it a creature of its own, a M. Fiévée, as chief director, who was soon replaced by a still more pliant tool, of the name of Étienne. At the same time the managers of the paper had to defray the salary of the official censor, which amounted to 24,000 francs. But, notwithstanding all these adverse circumstances, the *Journal de l'Empire* was prosperous, and the number of its readers went on increasing from day to day until it printed, in 1811, over 30,000 copies per diem. But the government became frightened at the extent of its influence. Under the mask of literature, theatrical criticism, and fine arts, it had actually insinuated itself into the arena of politics. It opened its columns to the 2 foremost political literary characters of the day, Madame de Staël and Chateaubriand. On every occasion, when literature or the stage permitted, sentiments were put forward by Bertin which were diametrically opposed to the views of Napoleon. After the performance of *Edouard en Écosse* the *Débats* came out with a theatrical criticism which bestowed great praise upon the Stuarts; while at the same time the *Mercur de France*, then under the editorial care of Bertin and Chateaubriand, alluded in the same complimentary strains to the English pretender. In such allusions Napoleon detected an attempt to support legitimate royalty, and he took this opportunity to vent his resentment against the paper, by confiscating it, and by sending Chateaubriand, Alexandre Duval, and Bertin himself, into exile in the island of Elba, whence, after a detention of nearly a year, Bertin escaped to Italy, and, in 1814, returned to Paris and resumed the conduct of his journal, which henceforward was published under its original name of *Journal des Débats*. On March 20, 1815, Bertin followed Louis XVIII. to Ghent, where, from April 14 to June 21, 1815, he edited *Le Moniteur de Gand*. After the 2d restoration he was again at work in Paris, and supported the king until the dismissal of Chateaubriand, when the *Débats* went over to the opposition, and Bertin was indicted for

having used in one of its articles, written by M. Bequet, the ominous and memorable words, *Malheureuse France, malheureux roi!* He was acquitted by the court of appeal. After the advent of Louis Philippe, the *Débats* steered clear through all political breakers, by making itself the organ of the constitutional bourgeoisie. M. Bertin presided over it from the first day of its publication until the eve of his death, Sept. 12, 1841. Many temptations had been held out to him, in the course of his long career, to occupy prominent political positions, but he declined all such proffers. He was fond of the society of literary men and artists, and figured himself as an author in the novels, *Elisa*, *La Cloche de minuit* and *La caverna de la mort*, partly translated from the English. II. BERTIN DE VEAUX, LOUIS FRANÇOIS, brother of the preceding, born in Paris, Aug. 18, 1771, died there, April 23, 1842, took an active part in the foundation of the *Journal des Débats*, after having been previously connected with the management of the *Eclair*. During the suspension of the *Débats*, in 1801, he established a banking house, and became, at the same time, vice-president of the tribunal of commerce. Like his brother, he followed Louis XVIII. to Ghent, and on his return, in Sept. 1815, was elected member of the chamber of deputies. He subsequently, until 1817, occupied the post of secretary of the minister of police. In 1820 he was reelected to the chamber, and in 1824 and 1827 he was member for Versailles. On Aug. 9, 1829, when Polignac came into office, he resigned the post of councillor of state, which he had held since 1827, and was one of the 221 deputies whose hostile vote led to the downfall of the cabinet, and became the forerunner of the July revolution, which Bertin prophesied by saying that "in less than a year France would be covered with tricolored cockades." After 1830, although the *Débats* had not joined in the protest of the other journals against the July ordinances, he submitted to the new order of things, and exerted a great influence in the chamber. He resumed his seat in the council chamber, and, Sept. 22, 1830, was sent on a diplomatic mission to Holland and England. Oct. 18, 1832, he became a member of the chamber of peers. He did not long survive his brother, to whose journalistic genius he was chiefly indebted for his prominent position. III. ÉDOUARD FRANÇOIS, nephew of the preceding, a landscape painter of some eminence in Paris, where he was born in 1797. When his brother Louis Marie Armand died in 1854, the interests of the journal required that the name of Bertin should continue to appear as chief editor; and Edouard Bertin, although his interest in the paper, like that of many other members of the family, is purely of a pecuniary character, and although entirely absorbed in his artistic pursuits, consented to sign his name every day to the paper as nominal editor. IV. LOUIS MARIE ARMAND, son of Louis François, born in Paris, Aug. 22, 1801, died Jan. 11, 1854, was employed, from 1820, in the *Jour-*

*nal des Débats*, and succeeded his father, as chief editor, after having been for some time secretary of Chateaubriand in the French legation in London. Under his management Michel Chevalier, Philarette Chasles, Alloury, Cuvillier-Fleury, Benazet, St. Ange, Berlioz, and other rising and eminent men, were enrolled under the banner of the *Journal des Débats*. Like his father, he pleaded the cause of his political and literary friends, but never accepted a favor or office for himself. He followed, also, his father's conciliatory course in politics, yet never degraded himself to the level of subserviency; and on one occasion, when Louis Philippe sent him for insertion a laudatory notice of the duke d'Aumale, he rejected the royal MS. V. LOUISE ANGÉLIQUE, sister of the foregoing, born at Roches, Jan. 5, 1805. She possesses the hereditary intelligence of her family, modified by feminine grace and delicacy. She is distinguished both as a musical composer and poetess. Her opera of "Esmeralda" with the libretto of Victor Hugo, was produced Nov. 12, 1836, with success. She has composed 2 others, and published a volume of poems entitled *Les Glanes*. Her poems are tender, sad, and harmonious, the versification peculiarly correct and elegant, and yet, although crowned by the academy, they have failed of complete success.

BERTRAND, HENRI GRATIEN, count, a French general, born March 28, 1773, at Châteauroux, died Jan. 31, 1844, celebrated chiefly for his faithful devotion to Napoleon, whose exile at St. Helena was not only shared by the general, but also by his wife. Napoleon dictated to him memoirs of the campaign of Egypt and Syria, which were published, after the death of the general, by his sons, in 1847. After the death of Napoleon, he returned to Paris, in 1821, the sentence of death passed upon him in 1816 having been cancelled by Charles X., who reinstated him in his former position. After the revolution of 1830, he was elected by his department to the chamber of deputies.

BERTRAND DE BORN, a celebrated troubadour and warrior of the 12th century. He was viscount of Hautefort, and assembled nearly 1,000 men under his feudal banner. Wars were his delight, and he was indefatigable in stirring them up. He took part in all the quarrels between Henry II., of England, and his sons, and urged Henry of Guienne, the elder, to rebel against his father, and declare himself sovereign of his continental possessions; he even pursued the war himself when Henry had made his submission to his father. He was at last subdued by Richard, but managed his affairs with so much address, that he obtained pardon, and his castle was restored to him. He excited the weak and undecided Henry to a second revolt, he hardly knew why, against his father. Henry died during the contest, and Bertrand was made prisoner by the king in his own castle, but he succeeded in disarming his anger by a few artful words, and all was restored to him, with the addition of a payment in money to defray the

expenses of the war. At the moment of the death of the old king, Bertrand was engaged in exciting Richard Cœur de Lion to rebellion. This event changed his plans, and he availed himself of the rivalry between Richard and Philip Augustus, to engage them in a crusade. After the disastrous termination of that enterprise, history loses sight of him, and biographers only relate that he died in the habit of a monk at Cîteaux. See Thierry's *Conquêtes de l'Angleterre*.

BÉRULLE, PIERRE DE, cardinal, was born of a noble family near Troyes, Feb. 4, 1575, and died in Paris, Oct. 2, 1639. He early showed remarkable mental acuteness and knowledge, and became distinguished for skill in controversy. He instituted, and was the first superior of, the order of Carmelites in France, and also founded the congregation of the Oratory in spite of the opposition of the Jesuits. He was a statesman as well as priest, and took a leading part in politics. He was often opposed to Richelieu, whose jealousy he excited, and who could not conceal his satisfaction at the news of his death. He accompanied the princess Henrietta to England, on her marriage with the prince of Wales. He shunned elevated positions, and was very unwillingly obliged to accept the hat of a cardinal. This elevation made no difference, however, in his humble way of life, and did not prevent him from sometimes taking part, as he had always done, in the servile work of the religious community to which he belonged. He was also a man of letters, and was the first to appreciate and encourage the genius of Des Cartes, urging him, by his sense of obligation to his Creator, to make known to the world his discoveries.

BERWICK, JAMES FITZJAMES, duke of, natural son of James II. of England and Arabella Churchill, the sister of John Churchill, the celebrated duke of Marlborough, born Aug. 21, 1670, killed before Philippsburg June 12, 1784. He was created duke of Berwick during his father's tenure of the English crown. He was early destined to a military life, was educated in France, and served his first campaigns in Hungary, under Charles, duke of Lorraine, who commanded for Leopold I. When the English revolution broke out, he was in attendance on his father, and accompanied him in his flight from Rochester to France. In the following year, 1689, he landed with his father at Kinsale, in Ireland, where he was, in spite of his youth, at once placed in command of a division of the army. In the first Irish campaign he greatly distinguished himself, both in forcing the passage of the river Finn at Cladiford, and subsequently in the repulse of the sortie *en masse* of the defenders of Londonderry, in which M. de Mairmont was killed at the first fire, and the duke had 2 horses shot under him. In the following year he conducted the retreat of the Irish army from Dundalk to the banks of the Boyne, with decided skill, and showed courage

in that disastrous battle. After his return to France, he never interfered again in the affairs of his native country, except in so far as he was opposed to her generals in the field, while serving the sovereigns to whom he had attached himself. While on the continent, he served under Luxembourg in Flanders; and then in the campaigns of 1702 and 1703, under the duke of Burgundy and Marshal Villeroy, in the course of which he was opposed to his illustrious uncle, the duke of Marlborough. In 1706 he was made a marshal of France, and sent into Spain, with an army, to support Philip V., the Bourbon claimant of the crown. The latter had just been driven, in defeat, with a broken and ruined army, from Barcelona, the siege of which he had been forced to raise, into Madrid, by the archduke Charles, also proclaimed king of Spain, under the title of Charles III., supported by an army of English and Portuguese. There Berwick gained the brilliant and decisive victory of Almanza. Some 12 years later, war breaking out between France, his adopted country, and Spain, whose king was his personal friend and benefactor, he did his duty well to both; for while he led his forces into Spain, he wrote to his son, the duke of Leyria, who was in Philip's service, admonishing him to do his duty to that king unmindful of his father. He was killed at the siege of Philippsburg by a cannon-ball, and died universally esteemed and respected.

BERWICK-ON-TWEED, a town of England, and county in itself, on the north side of the Tweed, within half a mile of its confluence with the German ocean; pop. in 1851, 12,578. It formerly belonged to Scotland, and was the chief town of Berwickshire, and the theatre of many sanguinary conflicts between the English and Scottish armies. It was finally ceded to England, in 1502; and by treaty concluded between Mary, queen of Scots, and Edward VI., it was declared a free town, and independent of both states. Many privileges still remain, peculiar to the town and its liberties; one of these is the fact that it is mentioned in the title of the kings of England, her present majesty being D. G. queen of England, Ireland, and Scotland, and of the town of Berwick-on-Tweed. Berwick was the gate of the two kingdoms, on the eastern side of the island; and through it either of the hostile nations had to pass, on that frontier, before it could invade the territories of the other; which for many years was the favorite and constant pastime, if not of the kings, at least of the border nobles and moss-troopers of the frontiers of the two countries. Consequently, the first step preliminary to what was called a warden raid, that is to say, an invasion by the feudal army of the marches, under the command of the lord warden, in order to distinguish it from the private forays of individuals, was the capture of the town and the slaughter of its garrison, if it was held by the enemies, for the time being, of the invading party; for

it was constantly garrisoned, constantly captured and recaptured, by the two contending parties, sometimes changing owners several times in the course of a year or two. During the furious conflicts between Robert Bruce on one side and Edward I. and Edward II. on the other, the town of Berwick suffered severely. On one occasion, when the English had been driven out, and the town strongly garrisoned with Scots, a large squadron of English ships, which had been ordered to coöperate with the royal army on its advance, but which had preceded the land forces too hastily, and entered the river unsupported, was either taken or burnt; and the indignation of Edward was excessive. He at first attempted to take the town by assault, as soon as he came before it, at a *coup de main*; but, being repulsed with some loss, sat down before it and commenced regular approaches. Here historians differ; the English writers affirming that, on a second assault being delivered, it was taken by storm; while the Scots insist that Edward had raised the siege, and was apparently in full retreat, when he gained possession of the gates by a stratagem, disguising his men with St. Andrew's crosses, and sending them forward under Scottish banners, as if they were reinforcements, in which belief they were admitted. In this instance, the dispute is a matter of some consequence, as on it turns, in some degree, the question of the character of Edward; since the bloody sack which followed the capture of the place, and which in one case would be merely one of the terrible and painful consequences of war, would be, on the contrary, in the other, as it is charged to have been by the Scottish writers, a savage atrocity on the part of Edward. Those writers are, however, obviously, though perhaps naturally, unfair to Edward, as any one must perceive who reads history impartially. It was to put an end to these cruel collisions that, by the convention between Mary and Edward, the town was declared independent; so that, as being too weak to resist either kingdom, it could not be held guilty by either for permitting the passage through its territories of the armies of the other. It is now a fine and flourishing seaport, driving a considerable carrying trade, especially in eggs and salmon, between north and south Britain; and having a considerable capital employed, and many boats and men engaged, in the salmon fisheries.

**BERWICKSHIRE**, a county on the Tweed, in the S. E. extremity of Scotland; area 446 sq. m.; pop. in 1851, 86,297. The Lammermoor is in this county. The chief employment of the county is agricultural pursuits. The land, being in the hands of large farmers on long leases, is cultivated with great skill. It abounds in places of historical interest, among which are the remains of Coldingham priory and of Dryburgh abbey, in which Sir Walter Scott was buried.

**BERYL** (Lat. *beryllus*, Gr. *βήρυλλος*). The

beryl, emerald, and aquamarine, are all the same mineral species, and only distinguished from each other by their blue and yellow shades of green or by the delicacy of the crystals. The beryl is sometimes also white. The emerald is more transparent and of finer colors than the beryl, and makes a handsomer gem. In some of the rich green specimens the color is derived from oxide of chrome. In the beryl oxide of iron appears to be the coloring matter. Aquamarine is a beautiful sea-green variety known to the ancients, and spoken of by Pliny, as already quoted under the article Aqua. The composition of the species beryl is that of a double silicate of alumina and glucina, consisting of silica 66 to 68 parts in 100; alumina 15 to 17; and glucina 12 to 15. It crystallizes in regular 6-sided prisms, which are often striated with longitudinal channels. Its hardness, rated as 7.5 to 8 on the mineralogical scale, is less than that of topaz and greater than that of quartz. Its specific gravity is 2.7. The crystals are found in quartz veins in granitic rocks, and also in the metamorphic limestones. There are many celebrated localities of gigantic beryls and beautiful emeralds in various parts of the world. Upper Egypt produced the mineral in ancient times, and it is still found in the mica slate of Mount Zabarah. Siberia, Hindostan, Limoges in France, Peru and New Granada, in South America, have all furnished splendid emeralds. The finest in the world are probably from the Muzo mine near Santa Fé de Bogota in New Granada; these are in a vein of dolomite in hornblende rock. A specimen from this locality is in the possession of the duke of Devonshire, which measures 2 inches in length, and weighs 8 ounces and 18 dwts., and is regarded as the finest emerald in Great Britain. Mr. Hope of London possesses one supposed to be from Coimbatore, which has been cut. It weighs 6 ounces, and is perfect in color and transparency. It cost £500. In the royal collection at Madrid are some splendid specimens of great size. The largest beryls known have been found in Acworth and Grafton, New Hampshire, and in Royalston, Massachusetts. One from Grafton measures 4 feet and 8 inches in length, 82 inches through in one direction, and 22 in another transverse, and weighs 2,900 pounds. Another is estimated to weigh nearly 2½ tons, measuring 45 inches through it in one direction and 24 inches in another. A crystal in the museum at Stockholm, found in Sweden, is considered to be the largest in Europe; it weighs 80 pounds. The value of the specimens is not at all dependent on their size. The large crystals are of coarse texture and feeble lustre, and possess no beauty. Emeralds are very successfully imitated by the French lapidaries, who use oxide of chrome for giving the rich green color.

**BERZELIUS**, JOHAN JAKOB, M. D., baron, a Swedish chemist, born Aug. 20, 1779, at the village of Wäversunda, near Linköping, in East Gothland, died at Stockholm, Aug. 7, 1848. His father filled the office of government school-

master at the village of Wafversunda; an office which is usually more highly appreciated in Sweden than in other European nations, with the exception perhaps of Scotland. Berzelius received his early education at home, under the care of his father, and in 1796 commenced the study of medicine in the university of Upsal. The chemical chair was then filled by Afzelius, with Ekeberg for his assistant. The lectures at Upsal, in those days, says Berzelius, were read without any experimental illustrations, and the instructions in the laboratory were of a superficial and unsatisfactory kind. After passing his examinations in philosophy, Berzelius quitted the university in 1798, and became assistant to a medical practitioner at Medevi, where he soon became known by an excellent chemical analysis of the mineral waters of that place. This analysis was published in 1804, when he took his degree of doctor of medicine at Upsal. Soon afterward he published his "Physical Researches on the effects of Galvanism on organized Bodies," which established his reputation as an experimental philosopher, and obtained for him the appointment of assistant professor of medicine, botany, and chemical pharmacy at Stockholm. In 1807 he succeeded Sparrmann, in the senior professorship of this department. He followed for some time the mode of teaching which was practised at Upsal, but afterward, on the suggestion of Dr. Marcet, who visited Stockholm, he adopted the method of illustrating his lectures by experiments, which gave great satisfaction to the students, and rendered him popular as a teacher of chemical science. As early as the year 1806, in conjunction with Hisinger, he commenced the "Memoirs relative to Physics, Chemistry, and Mineralogy," and his numerous contributions to those sciences have obtained for him that high rank which he holds as an accurate observer and experimental analyst. He was one of the chief founders of the medical society of Sweden, and in 1808 he became a member of the royal Swedish academy, of which he was chosen president in 1810. In the intervals of his public duties he paid several visits to Paris, and in 1812 he spent some time in London. In 1815 the king of Sweden named Berzelius a knight of the order of Vasa; and in 1818 he was appointed perpetual secretary of the Stockholm academy of sciences. On the coronation of the king in the same year, Berzelius was ennobled; and, contrary to the custom of the country, was allowed to retain his own name, the title of Baron Berzelius being ennobled in the lists of Swedish nobility. In 1821 he was named commander of the order of Vasa, and the sovereigns of France and Austria named him member of the legion of honor, and of the order of Leopold. These marks of distinction did not draw his attention in the least from his laborious and successful investigations; his important and experimental researches were never interrupted by worldly success and popularity; and even when he resigned his professorship in favor of Mosander,

in 1832, he still continued to pursue with ardent perseverance, his favorite investigations and experiments. In 1833, Berzelius married; and on that occasion, the king of Sweden wrote him a letter, in which he observed that "Sweden and the whole world were debtors to the man whose entire life had been devoted to pursuits as useful to all as they were glorious to his native country."—The works of Berzelius are both numerous and important. He contributed to the "Physical Memoirs," during a period of 12 years, some 47 original papers of great merit. His treatise on chemistry went through 5 large editions, and was partly re-written each time. It is most complete and best known in the edition translated into French under his own inspection, by Esslinger, and published in 8 vols. at Brussels in 1835. The last volume contains his very remarkable dissertation on chemical apparatus, with essays on qualitative and quantitative analysis, and the use of the blow-pipe. His mineralogical system is very highly valued. He considered mineral species as depending on the atomic proportions of their principal ingredients, and arranged and designated them accordingly. At the request of the academy of sciences, in 1822, he undertook those very remarkable "Annual Reports on the Progress of Physical Chemistry and Mineralogy" which have been so useful to the scientific world. As early as the year 1807, when the atomic theory of Dalton was hardly well known in Britain, Berzelius commenced his accurate researches on definite proportions, in which he extended and systematized the experiments of Wenzel and Richter; applying them not only to salts, earths, and metals, but to gases and organic compounds; assisting greatly to establish the truth of definite proportions. To him belongs the merit of proving that the proportion of oxygen is constant in all the neutral salts of the same acid; and his researches gave the first impulse to modern organic chemistry. Those who knew him personally bear testimony to the noble frankness and the manly simplicity of his character; and state that he was ever ready to impart to others, without ostentation, his vast stores of knowledge, and to assist the researches of those engaged in kindred pursuits, by his advice, the use of his laboratory, and the unrestrained communication of his accurate methods of investigation. Soon after his marriage in 1833, the directors of the Swedish iron works, in grateful acknowledgment of the light his researches had thrown on their art, and as a testimony to his important services to the useful arts of his country, conferred on him a pension for life; and we may here observe, that all the studies and investigations of Berzelius were made with a view to their practical application in the useful arts, as much as to the discovery of new truths of science. In the latter part of his life, Berzelius was afflicted with paraplegia, depriving him of the use of his lower limbs; but his mind was always clear, and he bore the affliction with calmness and resignation. Decay

was slow and gradual, without acute suffering, and he died in the 69th year of his age.

**BESANÇON** (*Vesontio*), a fortified place of great strength, the chief town of the French department of Doubs, on the river Doubs; pop. in 1856, 43,544. The lower town on the other side of the river, formerly called Baltans, is connected with Besançon proper by a stone bridge, the foundations of which are Roman. The town has an antique appearance. It has several fountains, one of which represents the apotheosis of Charles V. Its public buildings and institutions are numerous, namely, the cathedral of St. John (possessing as a relic the winding-sheet of Christ, which was formerly exhibited and attracted thousands of pilgrims, and some fine paintings), 2 Gothic churches, 8 hospitals, a deaf and dumb asylum, an academy of mathematics and belles-lettres, a lyceum, a public library containing 68,000 volumes and many MSS., a museum, and a museum of natural history, an academy of sciences, a society of agriculture and the arts, a theological seminary, a school of medicine, surgery, and pharmacy, a school of drawing and sculpture, of artillery, and of watch-making. It has extensive manufactories of watches, thread, cotton and silk stockings, paper hangings, fire-arms, leather, hardware, and linen. Besançon appears in history first, as Vesontio, in Caesar's *Bellum Gallicum*. In the days of the Roman empire Vesontio was the capital of the province of *Maxima Sequanorum*. The Alemanni destroyed it in the time of Julian the Apostate, and it was again ravaged by Attila and the Huns. In 886 it defended itself successfully against the Vandals. It was rebuilt by the Burgundians. It became the chief city of the county of Burgundy, more commonly called Franche Comté, and was made by the emperor Frederik I. a free and imperial city, 1162. Between the 9th and 18th centuries, it was called Chrysopolis, the golden city. Granvelle, the minister of the emperor Charles V., was born here, and became its archbishop. While Franche Comté was under Spanish dominion, Besançon preserved its rights as a German city, but lost them and became French when Franche Comté was ceded to France by the treaty of Niméguen, 1678. In 1814, Besançon was besieged but not captured by an Austrian army under Prince Lichtenstein. Among the eminent natives of Besançon, beside Granvelle, are Abel Rémusat, Marshal Moncey, Victor Hugo, Charles Nodier, Charles Fourier, and P. J. Prudhon.

**BESBORODKO**, **ALEXANDER ANDREYEWITCH**, a Russian statesman, born at Stolnoje, in Little Russia, in 1742, died August 9, 1799. He was minister of foreign affairs under Catherine II. and Paul I.; concluded the treaty of peace at Jassy, and other memorable treaties, and organized the coalition between Russia and Great Britain against France. He was made an Austrian count by Joseph II., and a Russian prince by Paul I. He left the reputation of an able statesman, and of a zealous patron of the fine arts.

**BESIKA BAY**, in Asiatic Turkey, in the province of Kudavenkiar, and the district of Karassi, near the promontory of Sigeum, is famous in contemporary history as the station of the British and French fleets in 1839 and 1840, and again on June 13 and 14, 1853, until Oct. 22. The fleets were sent to Besika bay as a counter-demonstration to the Russian occupation of the principalities, and were ordered to leave it and advance near to Constantinople, in consequence of the destruction of the Turkish squadron at Sinope.

**BESITTOON**, or **BISUTUN**, an escarped precipice which bounds the plain of Kermanshah in that part of modern Persia which was anciently called Media. On the lower part of this precipice is a huge tablet planed smooth by art. Below there is a rocky terrace strown with blocks of hewn stone. To these the name Besittoon is given, meaning "without pillars." About 50 yards above this platform there are the remains of a piece of sculpture with an inscription in Greek on it nearly obliterated by one in modern Persian, relating to the grant of lands. On the authority of Diodorus and Otesias, this work is attributed to Queen Semiramis. Further to the east is another pile of sculpture, exhibiting a line of 12 figures, of whom 1 is a king, another a prostrate suppliant, and 9 others captives in his rear. Under each is a short inscription in the arrow-headed character; under these again are 8 deep and closely written columns in the same character. They have not been deciphered.

**BESKOW**, **BERNHARD**, a Swedish dramatist, born in Stockholm, April 19, 1796, was ennobled in 1826, and appointed marshal of the royal household in 1833. He officiated for some time as director of the royal theatre, and is the author of several excellent tragedies, which were translated into Danish and German by Oehlenschläger, and of which *Torkel Knutson* is considered the best acting play on the Swedish stage. He wrote an opera, *Trubaduren*, for which Oscar, the present king of Sweden, composed the music. His literary reputation was increased by his books of travel, by his poetical works, and by his contributions to the press. The great prize of the academy was awarded in 1824 to his poem *Sveriges anor*. He became one of the 18 directors of this institution, and in 1834 perpetual secretary. The rare honor of receiving a diploma as doctor of philosophy from the university of Upsal, was vouchsafed to him in 1842.

**BESSARABIA**, the most S. W. province of the Russian empire, between Moldavia, Transylvania, and the Black Sea, consists of those portions of Turkey lying between the Dniester and the Pruth, which were wrested from the Turks by the treaty of Bucharest in 1812, and formed previously the N. E. part of Moldavia and the Budjak or Bessarabia proper. By the late treaty of Paris (March 31, 1856), a portion of Bessarabia was given back to Turkey, in order to give that power a safer frontier than

the Pruth. Article 20 declares, "The new frontier shall begin from the Black Sea 1 kilometre to the E. of the lake Bourna Sola, shall run perpendicularly to the Akerman road, shall follow that road to the Val de Trajan, pass to the S. of Bolgrad, ascend the course of the river Yalpuck to the height of Saratsika, and terminate at Katamori on the Pruth. Delegates of the contracting powers shall fix in its details the line of the new frontier." By article 21, the territory ceded by Russia shall be annexed to the principality of Moldavia under the suzerainty of the Sublime Porte. A difference between the Russian commissioners on the one hand and the Turkish, British, and Austrian commissioners on the other, as to which of 2 Bolgrads was meant, necessitated the meeting of a new European conference at Paris early in 1857, which settled that question substantially in favor of Turkey. Before its recent dismemberment, Bessarabia contained an area of about 18,900 sq. m., and 792,000 inhabitants, in 8 towns, 16 villages with markets, and 1,080 hamlets. These towns and villages contain 184 churches of stone, and 719 of wood, 16 chapels, 22 monasteries and convents, 1 ecclesiastical seminary, 9 district schools, and 2 hospitals. The commerce is mostly in the hands of the Jews and the Greeks. The Russo-Greek bishop resides at Kishenev. The peasantry are subject to feudal imposts. The soil of Bessarabia is very fruitful, but poorly cultivated, producing madder and saffron which grow wild, flax, hemp, tobacco, maize, millet, wheat, melons, pumpkins, apricots, and peaches. The mulberry thrives. The rearing of horned cattle, horses, and sheep is the great resource of the inhabitants. The culture of wine is also prosecuted. The northern portion of Bessarabia is traversed by a branch of the Carpathian mountains, here sinking into the plain. They are well wooded, and abound in wild animals. The southern part of the province is prairie-land. The chief or only mineral product is salt, which is obtained in great quantities from the lakes. The fisheries are plentiful. The principal rivers are the Danube, the Pruth, Yalpuck, and Dniester. These rivers form large lakes or marshes. The province is divided into 6 districts: Akerman, Bender, Ohoczim, Bielzi, Ismail, and Kishenev. Kishenev is the seat of government.

**BESSARION, JOHN OF BASIL**, a Greek monk, born probably at Trebizond, in the year 1389, died at Ravenna, Nov. 19, 1472. He was titular patriarch of Constantinople, archbishop of Nicosia, afterward cardinal and legate to France, in the time of Louis XI. After having spent 21 years in a monastery of Greece, devoted to theology and literature, he left it to follow the emperor John Palaeologus to Italy, who had gone there with the intention of being present at the council of Ferrara, in the hope of uniting the Greek and Latin churches. They were accompanied by many Greeks, distinguished by their talents and dignity. Bessarion seconded

with so much zeal the projects of Palaeologus that he became odious to the Greek church, while Pope Eugenius IV. rewarded him for his devotion to that of Rome, by the dignity of cardinal-priest. He had the confidence of many popes, and was near becoming one himself, but was prevented by the dissenting voice of one of the cardinals, who esteemed it an indignity to the Latin church, to choose a Greek pope. He was sent to France by Sixtus IV., to reconcile Louis XI. with the duke of Burgundy, and obtain aid against the Turks. He did not succeed, and it is pretended that he received a personal insult from the king, which humiliation some suppose to have been the cause of his death.

**BESSEL, FRIEDRICH WILHELM**, a German astronomer, born at Minden, July 23, 1784, died March 17, 1846. Having shown in early life a taste for astronomy, and some skill as a computer, he was appointed assistant to Schröter, at the observatory of Lilienthal. In 1810 he was appointed director of the observatory building at Königsberg, and held that post to the day of his death. In 1818 he published *Fundamenta Astronomiae*, a discussion of the observations made upon the fixed stars, by Bradley, at Greenwich, 60 years before, and including dissertations of inestimable value, on the method of stellar astronomy. He afterward published, regularly, his own observations, measured the distance of the star 61 Cygni from the earth, and took a distinguished part in all the astronomical discoveries and geodetic discussions of his day, and was justly considered, while living, the leading astronomer of the world, blending theory and practice with a master hand.

**BESSIERES, JEAN BAPTISTE**, marshal of the French empire, born at Praisac, in the department of Lot, Aug. 6, 1768, killed at Lutzen, March 1, 1818. He entered the constitutional guard of Louis XVI., in 1791, served as a non-commissioned officer in the mounted chasseurs of the Pyrénées, and soon after became a captain of chasseurs. After the victory of Roveredo, Sept. 4, 1796, Bonaparte promoted him on the battle-field to the rank of colonel. Commander of the guides of the general-in-chief during the Italian campaign of 1796-'97, colonel of the same corps in Egypt, he remained attached to it for the greater part of his life. In 1802, the rank of general of division was conferred upon him, and, in 1804, that of marshal of the empire. He fought at the battles of Roveredo, Rivoli, St. Jean d'Acre, Aboukir, Marengo—where he commanded the last decisive cavalry charge—Austerlitz, Jena, Eylau, and Friedland. Despatched in 1808 to assume the command of a division of 18,000 men stationed in the Spanish province of Salamanca, he found on his arrival that Gen. Cuesta had taken up a position between Valladolid and Burgos, thus threatening to intersect the line of communication of Madrid with France. Bessières attacked him and won the victory of Medina

del Rio Secco. After the failure of the English Walcheren expedition, Napoleon substituted Bessières for Bernadotte, in command of the Belgian army. In the same year (1809), he was created duke of Istria. At the head of a cavalry division he routed the Austrian general, Hohenzollern, at the battle of Esslingen. During the Russian expedition he acted as chief commander of the mounted guard, and on the opening of the German campaign of 1813, as the commander of the French cavalry. He died on the battle-field while attacking the defile of Rippach, in Saxony, on the eve of the battle of Lützen. His popularity with the common soldiers may be inferred from the circumstance that it was thought prudent to withhold the news of his death for some time from the army.

BESTOUJEFF, ALEXANDER, a Russian poet, patriot, and martyr, born in 1793, at the country seat of his father in the government of Voronezh, killed in battle in the Caucasus in 1837. He was educated in one of the imperial military establishments, and as an officer of the guards was an aide-de-camp of Prince Alexander of Wurtemberg in 1825. Bestoujeff, with Rylejeff, with whom, in 1828, he edited the first literary periodical published in Russia, under the title of the "Northern Star," was among the foremost leaders in the conspiracy and insurrection of 1825. For this he was condemned to lose his military rank and to be sent to Yakootsk, in Siberia, as a common soldier, without any claim to be advanced. In the snows and in the frozen atmosphere of this place of exile, his fiery imagination acquired new vigor. Under the name of the Cossack Marlinaky he wrote small novels and sketches for the "Telegraph," a periodical of Moscow, and for some others. By a special order of the emperor Nicholas, after passing 2 or 3 years there, he was transferred to the army of the Caucasus. There his adventurous and dangerous life had its effect on his style, and he now showed a great talent for description and for analysis of human character and passions. The more considerable of his writings during this period are 2 novels, *Mullah Nur* and *Ammaleth Beg*. His fate might have been rendered more supportable, but for the blind hatred of the grand duke Michael, the younger brother of the emperor Nicholas. Toward the year 1836, Nicholas relented, permitted the advancement of Bestoujeff from the ranks, and opened to him a prospect of again becoming an officer, and thus recovering his lost social condition. But it was too late, as shortly after he was killed along with a considerable detachment of Russian soldiers, by the mountaineers, in an ambush near Ekaterinodar. Bestoujeff, like Rylejeff, Lermontjeff, and Pushkin, all stars of Russian literature, is one of the many victims who, for different reasons and in various ways, were devoured by the reign of the emperor Nicholas. Two of his brothers, Nicholas and Michael, who were involved in the conspir-

acy and outbreak of 1825, suffered capital punishment in 1826.

BESTOUJEFF-RIUMINE, MICHEL ALEXIS PETROWITZ, count, a Russian statesman, born in Moscow, in 1698, of a family of English origin, and of the second class of nobles in Russia, died in St. Petersburg, April 24, 1766. He was educated in Germany, entered the civil service under Peter the Great, and became a diplomatist. Under the empress Anne he was made a member of the cabinet, and the empress Elizabeth, whose fullest confidence he possessed, created him count, great chancellor of the empire, and his influence in the government was almost boundless. He was strongly opposed to the Prussian and French diplomatic influence, and was disliked on this account by Peter III., nephew and presumptive heir of Elizabeth. He concluded several treaties with England, Sweden, and Denmark, which were favorable to English policy. By a treaty concluded in 1747, he paved the way for the union of Schleswig and Holstein with the kingdom of Denmark, and thus planted the first germs of the confusion and dissensions which prevailed in 1848 between that kingdom and Germany, and have not yet been entirely pacified. By his influence, the Russian troops supported Austria against Frederic the Great in the 7 years' war. But their commander, Apraxin, retired to Russia, and this occasioned the fall of Bestoujeff. He was imprisoned and degraded, but Catharine II., in 1762, restored him to liberty and to his previous social position, creating him a field-marshal, but not calling him to active service. He is regarded as the inventor of a chemical preparation known in medicine under the name of *tinctura tonica Bestoucheffi*.

BETANÇOS, DOMINGO DE, a Spanish missionary, born at Leon about the end of the 15th century, died in 1549. He emigrated to Hispaniola in 1514; he learned the Indian tongue, instructed the natives in the doctrines of Catholic Christianity, and endeavored to save them from Spanish cruelty. In 1526 he passed over into Mexico. Here he founded a convent, and was the Indian's friend. From Mexico he visited Guatemala, and founded another convent there. It was owing to his representations to the holy see that Paul III. promulgated his bull (1537) reminding all Christians that pagan Indians were their brethren, and should not be hunted down like wild beasts. Betanços refused the bishopric of Guatemala, and preferred to remain the simple provincial of his order. He died 1 month after his return to Spain, in the convent of St. Paul, at Valladolid.

BETEL NUT. The leaf of the betel pepper, *piper betle*, and the nut of the areca palm, *areca catechu*, together constitute this article, which is improperly called betel nut. But as an article of commerce it is sold separately under the name of betel nut, because as a masticating article it is always used with the leaf of the betel pepper. The habit of chewing this compound has extended from the islands of the

Malay archipelago, where it is chiefly found, to the continent of Asia, and its use is now universal from the Red sea to Japan. Its preparation for use is very simple; the nut is sliced and wrapped in the leaf, with a little quicklime to give it a flavor. All classes, male and female, are in the habit of chewing it, and think it improves the digestion. It gives to the tongue and lips a scarlet hue, and in time turns the teeth perfectly black. The Malays have a hideous appearance from its use, but the Chinese are very careful to remove the stain from the teeth. Persons of rank often carry it prepared for use in splendid cases worn at the girdle, and offer it to each other as people of Europe or America offer snuff.

**BETHAM, SIR WILLIAM**, an English antiquary and genealogist, born at Stradbroke, Suffolk, 1779, died at Blackrock, near Dublin, Oct. 23, 1858. From his father, the Rev. William Betham (author of "Genealogical Tables of the Sovereigns of the World," and "A Baronetage," in 5 vols. 4to), he may have derived a predilection for genealogy and heraldry. Brought up to the printing business, its mechanical details annoyed him. Much more to his taste was the task of revising a portion of Gough's edition of Camden. In 1805 he went to Dublin as clerk to Sir Charles Fortescue, Ulster king of arms; soon after, he became his deputy, and succeeded him in 1820. He had previously (July, 1812) been appointed genealogist of the order of St. Patrick, and knighted. He was also deputy-keeper of the records at Dublin. He arranged, classified, and catalogued several hundred volumes of these papers—made an index, of 40 folio vols., to the names of all persons mentioned in the wills at the prerogative office, Dublin; largely employed his time in antiquarian researches; wrote books to show the identity of the Etruscans and the Ibero-Celtic race, and of both with the Phœnician; and also produced two standard books—one on "Parliamentary and Feudal Dignities," the other "On the Origin and History of the Constitution of England, and of the early Parliaments of Ireland." Sir William's successor, as Ulster king of arms, was Mr. Bernard Burke (soon after knighted), author of the well-known "Peerage."

**BETHANY**, a village of Palestine, on the eastern slope of the mount of Olives, 15 furlongs from Jerusalem, mentioned in the New Testament as the place where Christ was anointed, often lodged, and raised Lazarus from the dead. His ascension, too, took place on his way to and near Bethany. It is now a desolate village of about 20 families, called by the Arabians El-Azerjeh. The monks and Mohammedans point out various objects of curiosity, among which is a ruined tower which they say was the house of Mary and Martha, the stone on which Jesus sat, the tomb of Lazarus, a deep vault in the limestone rock, probably a natural cave remodelled by human labor, in which the Franciscans say mass twice a year. A church,

called the castle of Lazarus, was built over this grave by St. Helena in the 4th century. In the 12th century it became the site of a very important monastic establishment. It was still in existence in 1484, but there now remain of it only the stone walls.

**BETHANY**, a post village of Brooke co., Va., situated 16 miles N. E. of Wheeling. It is the seat of Bethany college, founded in 1841, by the Rev. Alexander Campbell, the founder of a new sect of Baptists called Disciples.

**BETHEL**, a city of ancient Palestine, 12 Roman miles N. of Jerusalem. It was originally called Luz, and was named Bethel (house of God) by Jacob, who here beheld in a vision the angels ascending and descending. Bethel was a city of Ephraim, lying near the northern boundary of Benjamin. The ruins called Beitin occupy its ancient site.

**BETHEL**, a flourishing town of Shelby co., Mo., lying on the north fork of North river, 98 miles N. N. E. of Jefferson City. It was settled in 1842 by a German colony from Pennsylvania, who own 4,000 acres of fertile land, and practise farming and the mechanical arts. The German language is the only one used. They have a handsome church, mills, and a glove factory. Pop. 1,000.

**BETHEL COLLEGE**, a flourishing educational institution, established by the Cumberland Presbyterians, at McLemoresville, a village of Carroll co., Tenn., 114 miles S. W. of Nashville.

**BETHELL, SIR RICHARD**, attorney-general of England under Lord Palmerston, born in 1800. He graduated as B. A. at Oxford before he was 18, being "first class" in classics, and "second class" in mathematics, and was elected a fellow of Wadham college. In 1823 he was called to the bar, and devoted himself to equity practice with much success. He was made a queen's counsel in 1840, and solicitor-general, December, 1852, under Lord Aberdeen's government, when he was knighted. In November, 1856, when Sir Alexander Cockburn was appointed chief-justice of the common pleas, on the death of Sir John Jervis, he was succeeded, as attorney-general, by Sir Richard Bethell, who was also counsel to the university of Oxford, and vice-chancellor of the county palatine of Lancaster. As an equity lawyer his standing is high. His politics are ultra liberal. He entered parliament in April, 1851, for the borough of Aylesbury, which he has since continued to represent. As a parliamentary speaker he has no reputation, but is highly esteemed as "a good business man." He went out of office with the Palmerston cabinet in February, 1858.

**BETHENCOURT, JEAN**, seigneur de, the conqueror of the Canary isles, born in Normandy, died 1425. He was chamberlain of Charles VI. of France. His house having been pillaged and himself ruined by the English, he mortgaged his estate and went to La Rochelle, made up a company and set sail in

quest of adventures, May 1, 1402. After touching at the Spanish ports, and taking on board a Guanche prince, Angeron, whom he found at Cadiz, he sailed for the Canaries. He visited the islands separately, and constructed a fort at Lanzarote. Finding his forces insufficient to subdue the natives, he returned to Spain for reinforcements, leaving his companion, Gadifer, in command. On his return from Spain with succor, he found that Gadifer had already subdued a considerable number of the natives. The Norman nobleman called himself lord of the Canary islands, and had a native king baptized with the name of Louis, Feb. 20, 1404. The conversion of the greater number of the Guanches to Christianity followed. Bethencourt wished to extend his conquests to Africa, but dissensions arose between himself and Gadifer, which resulted in the return of the African expedition without having effected any thing, and the abandonment of the Canaries by Gadifer. Bethencourt imported into the Canaries many mechanics and farmers from Normandy, induced the pope to send a bishop there, Dec. 15, 1405, redeemed his Norman estate from its indebtedness, retired thither to end his days, 1406, and left the Canaries in the hands of his nephew.

BETHENCOURT Y MOLINA, AGUSTIN DE, a Spanish engineer, born on the island of Tenerife, 1760, and descended in a direct line from the conqueror of the Canaries. He died at St. Petersburg, July 26, 1826. He was educated at Madrid. When Spain was subjugated by French arms, he entered into the service of Russia, where he reached the rank of a major-general. He was after the peace employed by the Russian government to execute at Nijni-Novgorod the public buildings, which give accommodations to the great fair held there. He established the corps of hydraulic engineers, and a school for the exact sciences.

BETHESDA (place of effusion), the name of a pool or fountain which, according to Scripture, was situated near the sheep-gate, and having porches or resting-places around it for the sick. As the name imports, the waters of this fountain are said to have been subject to periodical and intermittent effusion, and were believed by the Jews to have certain medicinal virtues, to heal the diseases of those who stepped first into them at their flow. At this pool Jesus is related by John to have performed the miracle of healing the lame man. For a long time travellers have pointed out a dry basin or reservoir, which from its construction was once evidently designed to hold water, and lying at the north-eastern corner of the Temple Mount, as the Bethesda of Scripture. Its extent is about 460 feet, including an excavation extending from its south-western corner under the wall of Temple Mount, as measured by Dr. Robinson. The southern point of the reservoir extends nearly to the modern gate of St. Stephen. This gate is supposed by most travellers to be the sheep-gate of Scripture.

Dr. Robinson, however, had some reason to suppose that this was a mistake, and applied himself on the spot to an investigation of the matter. The result is, that this indefatigable scholar and Scripture geographer has probably restored to the world the real Bethesda. Since the days of Quaresmius (1625), who first made the suggestion, Biblical scholars have surmised that there was a connection existing between the waters of the pool of Siloam, situated on the south-eastern declivity of the high land on which the city of Jerusalem is built, and the fountain of the Virgin, some 1,200 feet to the north, and about 1,000 feet directly south of Temple Mount. Dr. Robinson found that there was also a popular tradition that such connection existed, but which way the waters flowed, if either, was not determined even traditionally. He resolved to ascertain both these facts. The result was that he actually made the passage from the fountain of the Virgin, to the north, to the pool of Siloam at the south, and found the measured distance to be 1,750 feet, the channel being somewhat circuitously cut through solid rock for most of the distance. While at the fountain of the Virgin, which he found to be the supply for the pool below, he actually witnessed one of the intermittent flowings described in Scripture as the troubling of the waters by an angel, and ascertained from a woman who came to the place to wash, that such effusions were frequent, but irregular, at all seasons of the year, though less so in the summer, and that she had frequently seen flocks and men standing around it, waiting for the outpourings, when it was completely dry. The fountain is minutely described, as also the pool, in their present appearance, in Dr. Robinson's "Biblical Researches," vol. i., pp. 333-348. Little doubt can remain that the fountain of the Virgin is the Bethesda of Scripture. The waters of the two have indeed been pronounced by travellers entirely different. But no force can be attached to this, now that the fact of a connection is established. The irregular flowing of the fountain of the Virgin is yet to be certainly accounted for. Under the grand mosque occupying the site of the ancient temple, there is known to be a well, which receives its water from an arched chamber, and discharges it somewhere. It is suggested by Dr. Robinson that it may find an outlet to this fountain of the Virgin. It is certain that the well is sometimes dry, but its connection with the fountain has not yet been sufficiently examined to warrant any decision.

BETH-HORON, upper and lower, two villages mentioned in Scripture, situated 9 miles N. W. of Jerusalem. The former is identical with the modern village of Beit-Ur. There is a pass between the two villages, down which Joshua pursued the Amorite kings. Traces of ancient walls are still visible.

BETHLEHEM, the "bread-town," or, as the Arabs now term it, the "place of flesh." Bethlehem-Ephratah, so called to distinguish it

from a Bethlehem in Zebulon, is famous for many remarkable events, as the birth of David and his inauguration and anointing by Samuel. But that which renders Bethlehem eminent in Christian history, is the nativity of Jesus. The present inhabitants of Bethlehem point out to travellers the very spot where, as they believe, he first saw the light, marked with a star in the floor of the grotto under the church of the Nativity, and in another part of the same grotto they show a marble stone, scooped out in the form of a manger, which they relate to have taken the identical place of the original manger in which he was laid. The church is said to have been built by the empress Helena, and it was afterward repaired and adorned by Constantine. Just out of the city, in the valley which it overlooks, Dr. Clarke thought he discovered the "wall of Bethlehem" referred to by David. Dr. Robinson does not agree with him, and found no well to which he could assign this distinction. It is difficult to say how much value is to be attached to the traditions concerning the exact spot of the birth-scenes of Jesus. Kitto assigns considerable force to these traditions, but on the whole decides against them. Two things certainly give the town of Bethlehem an interest to modern Christians. Here, and in this very grotto, that scholar and father of the early church, Jerome, spent many years of his time in meditation and writing; and this town was one of the first possessions wrested from the Saracenic and Turkish power in the crusades. It was erected into a see, but in 1244 was overrun by the Tartars. Its inhabitants are now all Christians, and are divided among the Latin, Greek, and Armenian churches. They sell to travellers various relics, some of which are very curiously and exquisitely carved. The present city is on the brow of a hill, or rather a long ridge, and overlooks the opposite valley. There never has been any dispute that the present city occupies the site of the ancient one.

**BETHLEHEM**, a township and post borough of Pennsylvania. It is in a pleasant and commanding situation on the Lehigh river, across which, at this place, is a bridge 400 feet long. Bethlehem was settled by the Moravians, in 1741, and contains a Gothic church of that denomination, built of stone and of large dimensions, a female seminary of high reputation, and several schools and benevolent institutions. It is much resorted to in summer. Pop. 2,104.

**BETHLEHEMITES**. I. An order of monks somewhat like the Dominicans, who came to England in 1257. They were so named because they wore on the breast a five-pointed star in commemoration of the star that appeared at the birth of Jesus. They never flourished much, and had only one house or convent in England. This was at Cambridge. II. The **AMERICAN BETHLEHEMITES** were established in the city of Guatemala by a Franciscan monk named Bethencourt, a native of the island of Teneriffe, about 1655. Innocent XI. (1687) sanctioned the order,

as also the female order of Bethlehemites, founded by Maria Anna del Galdo, who belonged to the Tertiaries of St. Francis. Twenty years later, the privileges of the order were enlarged to an equality with those of the Augustinians, Dominicans, and Franciscans. There are about 40 convents of Bethlehemites in the Canary islands, and a parent monastery in Guatemala.

**BETHLEN, GABOR**, a sovereign prince of Transylvania, and king of Hungary, born in 1580, of an eminent Magyar Protestant family, died Nov. 15, 1629. During the dissensions in Transylvania between the 2 Bathoria, Bethlen succeeded in seizing the supreme power. He owed this to his popularity, and to the support of the Transylvanian and Hungarian magnates, but above all to a Turkish army bestowed in return for having recognized the suzerainty of the Porte. Austria could not oppose him, and in 1619 he joined the Bohemians, and thus participated in the beginning of the 30 years' war. He invaded Hungary, took Pressburg, and the Magyar nobles elected him their king. He, however, concluded a peace with Ferdinand in 1620, and renounced the royal title in consideration of some lands in the north of Hungary, and in Silesia. In 1623 he again took up arms, and at the head of 60,000 men invaded Moravia; but being unable to join the Protestant army, he made an armistice, then a peace, which he again broke in 1626, but without any great harm to Austria, whose army defeated that of Mansfeld, which defeat paralyzed the intended movements of Bethlen. His reign was one of the most celebrated and prosperous among the Magyars. He protected science, erected an academy at Weissenburg, calling thither several celebrated and persecuted German professors, and was generally considered as one of the props of Protestantism, and a glory of the Magyar race.

**BETHMANN BROTHERS**, a banking establishment at Frankfort-on-the-Main, known by its negotiations of loans with the Austrian, Danish, and other governments. Originally, the firm was carried on under the name of Jakob Adamy, an uncle of the elder Bethmann, who, to escape religious persecution, emigrated toward the end of the 17th century from Holland to Nassau, near Frankfort. Adamy took his nephews, Johann Philipp and Simon Moritz Bethmann, into the business, and after his death, Jan. 2, 1748, they changed the name of the firm from Jakob Adamy to Bethmann Brothers.—**SIMON MORITZ BETHMANN**, the son of Johann Philipp, born Oct. 31, 1768, died Dec. 28, 1826, became the chief of the house after the death of his father. He was the man of genius of the family, a philanthropic citizen, an able financier and accomplished courtier. The emperor of Austria ennobled him, and Alexander of Russia appointed him his consul-general. One of his sisters married Jakob Hollweg, a partner of the house, which union founded the Bethmann-Hollweg branch of the family. Another sister

married Victor François vicomte de Flavigny. The present head of the Frankfort banking house is PHILIPP HEINRICH MORITZ ALEXANDER VON BETHMANN, born Oct. 8, 1811, married in 1842 to a Saxon gentlewoman of ancient family, Marie von Bosa. His brothers, KARL, OESAR, LUDWIG and ALEXANDER, were ennobled and made chamberlains by the king of Bavaria. The Bethmanns, beside the large amount of capital invested in their banking operations, are owners of extensive estates in Bohemia. Karl and Alexander own the estates of Krzinetz, Ronow, and Dobrowan. This stake in the Austrian possessions undoubtedly contributes to their readiness to oblige the Austrian government, in the prosperity of which they are personally interested. The Bethmanns, eclipsed as they are by the Rothschilds, are less involved than the latter firm in stock-jobbing operations, and although the business which they transact is on a smaller scale, it is also less hazardous. They have wide-spread relations with Vienna, Berlin, St. Petersburg, Amsterdam, Paris, London, &c. Of the great banking business arising through the Frankfort fair, and the position of that city as a commercial mediator between southern, central, and northern Germany, a considerable share passes through the hands of the Bethmanns. The Bethmann villa, at Frankfort, contains Dannecker's celebrated statue of Ariadne riding as the bride of Bacchus upon a panther.

BETHPHAGE, a place of Scriptural interest which has passed away, leaving no trace behind. Its name was significant of its general location, but not of the particular site. "The place of figs," it must have been situated somewhere on the eastern slope of that range of hills extending north and south between Jerusalem and Bethany, at the foot of which in the western valley flowed the Kedron. The principal points of this range are the mount of Offence and the mount of Olives. The fig-tree still abounds both on the eastern and western slopes of the range, and even beyond Bethany toward Jericho. Some travellers have been disposed to place Bethphage on the site of the modern village of Abu Dis, lying south, and a little to the east of Bethany. Dr. Robinson thinks that could not have been its position, and gives as little credit to the tradition of the monks of the country, who place it between Bethany and the summit of the mount of Olives, since there is no trace that a village of any description ever existed there. Lightfoot thought it was a district extending from the mount of Olives to Jerusalem, and embracing a village of the same name. Calmet mainly agrees with him, and thinks it is not certain that any thing more is meant than a house or stand for selling figs from gardens on the slope of Olivet where they were raised, and therefore no trace of a village need be expected.

BETHSAIDA. Until the time of Reland there were some very knotty geographical questions involved in the Scriptural accounts of Bethsaida, and the events which had occurred

there. Reland discovered that there must be two Bethsaias; one situated on the east and north side of Lake Gennesaret, near the embouchure of the Jordan into that sea, and the other somewhere on the western side of the same lake. This discovery solved the difficulties. Still no eastern travellers have succeeded in identifying the western city of this name, though it possesses much the greater sacred interest. It was the birth-place of 8 disciples of Jesus, and a frequent abiding place of Jesus himself. Here he wrought many of his miracles, and in Chorazin, a Galilean village, which is hidden in quite as great geographical obscurity at the present day. It was near this latter Bethsaida that Jesus is related to have fed the multitudes miraculously. No geographical traces of these places are discoverable since the days of Jerome. The word Bethsaida means "the place of fish." It was on the lake on which Bethsaida bordered that the disciples toiled all night and caught nothing, and then drew a full net when they cast it on the other side of the ship, by the direction of Jesus.

BETH-SHEMESH, a city of ancient Palestine, which probably occupied the site of the modern village, Ain Shems, about 15 miles W. S. W. of Jerusalem, where extensive ruins are still remaining.

BETHUNE, a fortified town of France, department of Pas-de-Calais, built on a rock above the river Brette, 16 miles N. N. W. of Arras. Pop. in 1856, 7,720. Its castle was constructed by Vauban. It has a Gothic church, communal college, 2 hospitals, and manufactures of linen, cloth, beer, &c. It was taken by the allies in 1710, and restored in 1718, by the treaty of Utrecht.

BETHUNE, DRUM, an eminent philanthropist, born at Dingwall, Scotland, in 1771, died in New York, Sept. 18, 1824. In early life he resided at Tobago, and removed to New York, where he settled as a merchant in 1792, joined the church of Dr. Mason, and was prominent for his efforts in the cause of religion. Before a tract society was formed in this country he printed 10,000 tracts at his own expense, and commenced their distribution. He also imported Bibles for distribution. From 1803 to 1816 he supported one or more Sunday schools. He devoted to such works one-tenth of his gains. — GEORGE W., son of the preceding, a genial divine and poet, minister of the Dutch Reformed church, was born in the city of New York, in March, 1805. In 1826 he entered the ministry of the Presbyterian church, but passed over the next year to that of the Dutch Reformed. He was settled first at Rhinebeck, on the Hudson, whence he removed to Utica, at Philadelphia in 1834, and in 1849 over a large and influential congregation in Brooklyn, N. Y. He is the author of several highly esteemed works of devotion, entitled the "Fruit of the Spirit," "Early Lost," "Early Saved," and the "History of a Penitent;" of a volume of "Lays of Love and Faith, and other Poems," published in 1848;

and of collections of orations, occasional discourses, and sermons. He has reputation as a scholar and wit, and edited in 1847 an American edition of Walton's "Complete Angler," being himself an enthusiastic follower of the "contemplative man's recreation." He is highly esteemed as a sound and learned divine, a preacher of great earnestness and eloquence, and a secular orator of excellent fancy and pleasant humor.

BETHUNE, JOHN, a Scotch peasant poet, born at Moniemail, in the county of Fife, in 1812, died Sept. 1, 1839. He passed his boyhood tending his father's cows on the shores of a small "waveless lake," and, like most of his countrymen, had heard at an early age the finest strains of Burns. A parish school-master, from the college of St. Andrews, recited to him the best pieces of Scott, Byron, Moore, and Campbell, with which he stored his memory. He had written many verses before he was apprenticed to a weaver in 1824, and from that time, though afflicted with feeble health, wrote in secret a great variety of poems, many of which were afterward published. His pieces which had most success with the public were short tales and sketches, from which he derived a sufficient income for his support during the latter years of his life.—His brother ALEXANDER, born in July, 1804, died June 18, 1848, coöperated with him in his literary enterprises; and also wrote "Tales and Sketches of the Scottish Peasantry" and other works. He was also a noble illustration of literary culture under the most adverse circumstances.

BETHUNE, JOHN ELLIOT DRINKWATER, a member of the supreme council of India, and president of the council of education, born in 1801, died Aug. 12, 1851. He was educated at Cambridge, called to the bar in 1827, and after occupying different situations under the government of 1848, was appointed to the above-mentioned place in India. His administration is memorable for the success of a measure destined, perhaps, to exercise a paramount influence upon the Asiatic world, but hitherto considered visionary, the establishment of schools for the education of native females, conducted by Europeans, and in their method of instruction. By pledges that no interference should be attempted with the religion of the pupils, he secured the countenance and active support of several native gentlemen of rank, and a school was commenced under their auspices. No man was admitted except himself; but it was an object of curiosity and interest to the native ladies, to whose attendance and approval it was largely indebted for its success. After the number of pupils had increased to 50, other schools were opened, and before he died there were 5 or 6 in operation in Bengal. All the honors due to a great benefactor were paid him at his funeral by an immense concourse of natives.

BETICK, an important ferry across the river Oxus, 60 miles S. W. of Bokhara, on the route

between Persia and Bokhara. The river is at this point 2,000 feet across, and 25 in depth.

BETISBOOKA, a river of Madagascar, emptying into the Mozambique channel, on the N. W. coast of the island. About 15 miles from its mouth it expands into a gulf, dotted with islands. It is the principal route from the Ovah capital to the sea-coast.

BETLIS, or BIRLIS, a town of Turkish Armenia, in Koordistan, lying on the W. shore of Lake Van, in lat. 37° 45' N., long. 43° 31' E. It is situated in a wide ravine, more than 5,000 feet above the sea level. Pop. about 10,000, of whom about  $\frac{1}{2}$  are Armenians. The town has 3 mosques, 12 convents, some baths and caravansaries, and an ancient castle. It has manufacturing of cotton cloths, celebrated for their bright red dye of fire-arms, and silverware, and exports excellent tobacco to Constantinople.

BETROTHMENT, a mutual compact between 2 parties, by which they bind themselves to marry. In the Orient, where the climate contributes to the precocity of the sexes, and leads to contracting marriages even during childhood, the ceremony of betrothal was surrounded with peculiar solemnity, although it frequently happened among the Chinese, Hindoos, Persians, and Syrians, that the principal parties to the contract were still in the nursery, and did not make each other's personal acquaintance until the day of the wedding. With the Hebrews a betrothment was a ceremony, as it still is in our days, in which financial considerations took a prominent part. The bridegroom gave to the bride a shekel, and said to her, *Mekad-deshet*, "We are engaged." He was at liberty to obviate this embarrassing oral effusion by writing the word down upon paper, and handing it to his prospective wife. Rings were also exchanged, but the chief formality, to which the orthodox Jews of the present day still adhere, consisted in the solemn reading of the marriage contract, in presence of the relatives and friends and other witnesses, with the civil authorities, now represented chiefly by a public notary and by the lawyers who have drawn up the contract. This contract is peculiarly strict as to the money which the family of the bride make over to the bridegroom. When all parties have signed the contract, the whole procession of relatives and friends generally assemble at the house of the bride's father, where great embracing and rejoicing take place, which generally terminate in luxurious banquets, when toasts are offered to the young couple, whose delicate blushes are soon obliterated by the convivial flashes which the champagne and Rhine wine produce on such delightful occasions. The father of the bride, who has promised a large dowry, is the great character at such Hebrew betrothments. On the one hand, the effort of parting with so much money, on the other the gratification of his pride in having the world see that he has any money at all to part with, blend in a most cu-

rious manner with his paternal feelings; and, on the whole, there is something in the importance attached to the dowry which detracts from the solemnity of the event. The contract is called by the Jews *thensim ris-ehonim*. In the laws of Moses there are also certain provisions respecting the state of the virgin who is betrothed. Selden's *Uxor Hebraica* gives the schedule of Hebrew contracts of betrothment. With the Jews, a young lady is rarely allowed to enter into an engagement without the cognizance of her relatives, who, in fact, in most cases, arrange matters for her, and generally avail themselves of the services of marriage brokers, who receive a percentage upon the amount of the dowry, beside a gratuity. In the continental cities these Jew marriage brokers have matches always on hand, with dowries varying from \$5,000 to \$200,000, and as soon as the betrothment has taken place they look upon the bargain as concluded; but cases frequently occur, in which on the day of the wedding the bridegroom breaks the match because the Austrian metalliques or Spanish Ardoins, tendered in payment for the dowry, have fallen in value, and reduced the dowry perhaps to the extent of 20 or 25 per cent.—Among the ancient Greeks, the father made a selection for his daughter. The young couple kissed each other for the first time in the presence of their friends, and it was customary for the bridegroom to bring flowers daily, until the wedding day, to the house of his bride.—The Arab sends a relative to negotiate about his intended bride, and the price at which she is to be had.—The bridegroom of Kamtschatka has to serve in the house of his prospective father-in-law before an engagement is allowed to take place.—With the Letts and Esthonians no engagement is considered valid until the parent and relatives of the bride have tasted of the brandy which the bridegroom presents.—Among the Hottentots, the would-be bridegroom is not allowed to propose without being accompanied by his father. Father and son walk arm in arm, with pipes in their mouths, to the house of the bride, where the engagement takes place.—Among some of the indigenous tribes of America it was customary to keep the betrothed lady in durance for 40 days, as the superstition prevailed that she would exert an occult influence upon any thing she touched or any body with whom she came into contact. During these 40 days the lady was kept on starvation fare, so that when the day of the wedding came she looked more like a skeleton than like a bride.—In the Roman law, the *sponsalia*, or betrothment, is defined to be a promise of future marriage, which could take place after the parties were 7 years of age. The *sponsalia* might be made without the 2 parties being present at the ceremony, and might be dissolved by one party certifying to the other in the following words: *Conditiones tuae non utor*.—The canonists speak of betrothing, and in the middle ages the Roman and

canon statutes constituted the law on the subject. While the Greek church considered betrothments as binding as weddings, the church of Rome viewed them simply as promises of marriage. But as much confusion ensued, the council of Trent decreed that no betrothment was valid without the presence of a priest and of two or three witnesses. This decree was adopted in France by Louis XIII., in 1639, and became known as the *ordonnance de Blois*. Until the revolution of 1789, when betrothments ceased to have legal importance, they were generally celebrated in France by pronouncing the nuptial blessing in front of the church, by reading the marriage contract, and by exchanging presents, while the French bridegroom, as was also the case with the Roman bridegroom, had to pay a certain amount of earnest-money to ratify the bargain. In England, formal engagements of this kind were usual down to the time of the reformation. In Shakespeare and other writers many illustrations occur, from which it may be inferred that betrothments were celebrated by the interchange of rings, the kiss, the joining of hands, and the attestation of witnesses. Marriage contracts have been preserved in many ancient British families, with stipulations respecting the apparel of the future bride and the cost of the entertainment which is to be provided at the wedding. In modern times, the Hebrews and Germans, more than any other nations, surround betrothment with a prestige of solemnity, although even with them it has now seldom any other meaning than that the parties have privately engaged themselves. In England and the United States rings are frequently interchanged between the lady and the gentleman, and wherever it can be satisfactorily proved in law that either party has suffered materially by any breach of promise on the part of the other, the courts will award damages. In the United States, engagements are made with more nonchalance than in Europe—the free will of young people is less interfered with, and the whole relation is stripped also in many other respects of the conventional form which it assumes on the old continent.

BETTERMENTS, in law, improvements made to an estate which render it better, and are more than mere repairs.

BETTERTON, THOMAS, a celebrated English actor, born 1685, died April, 1710. He was the son of an under-cook in the service of Charles I., and was apprenticed to a bookseller in London. His master, Mr. Rhodes, obtained a license for a company of players in 1659, and with him Betterton commenced his career. He was engaged by Davenant in 1662. His position was soon preëminent, and he became an established favorite. He seems to have had no personal graces from nature to second his rare talents, if the following account be true: "Mr. Betterton, though a superlatively good actor, labored under an ill figure, being clumsily made, having a great head, a short, thick neck,

stooped in the shoulders, and had fat, short arms, which he rarely lifted higher than his stomach. His left hand frequently lodged in his breast between his coat and waistcoat, while with his right he prepared his speech; his actions were few but just; he had little eyes and a broad face, a little pockfretten; a corpulent body, and thick legs, with large feet; he was better to meet than to follow, for his aspect was serious, venerable, and majestic. In his latter time, a little paralytic; his voice was low and grumbling, yet he could tune it by an artful climax which enforced universal attention even from the fops and orange girls. He was incapable of dancing even in a country dance, as was Mr. Barry, but their good qualities were more than equal to their deficiencies." Betterton had the rare faculty of identifying himself with his part. He married Mrs. Sanderson, an actress of almost equal merit with himself, whose Lady Macbeth was reckoned a perfect piece of acting. He was prudent and saving, but he lost his small means in a commercial speculation, and a theatre which he afterward opened was not successful. After his retirement from the stage, he reappeared in his old age a few times to take a benefit; and his last appearance, April 13, 1710, was the proximate cause of his death; for having used remedies to check a fit of the gout, in order that he might keep his engagement with the public, he drove it to his head. His widow died of grief for the death of her husband.

BETTINELLI, *SAVERIO*, an Italian author, born in Mantua, July 18, 1718, died there Sept. 13, 1808. He was educated by the Jesuits of his native town of Bologna, and became a member of their order in 1736. From 1739 to 1744 he taught literature at Brescia; while at Bologna, whither he was sent for the purpose of attending the divinity school, he displayed his ruling passion by the composition of a tragedy, entitled *Jonathas*. In 1748 we find him at Venice as professor of rhetoric, and in 1751 at a college in Parma, where he remained until 1759. Among his acquaintances were the foremost men of Italy, Germany, and France, including Voltaire. In 1767 he preached at Verona, and thrilled his congregation by the pathos of his sermons, while in his house he delighted them by the luxuries of his table. When the order of the Jesuits was abolished, he immediately threw up the professorship, which he then held at Modena, and retired to his native town, where he devoted himself for the rest of his life to literary pursuits.

BETTY, *WILLIAM HENRY WEST*, commonly known as "the young Roscius," born at Shrewsbury, in England, Sept. 13, 1791. In infancy he accompanied his father, who was a farmer, to Ireland. Here he was educated by his mother, who encouraged his decided taste for recitation by frequently reading to him. In 1802, at Belfast theatre, he first saw a dramatic performance. The play was "Pizarro," in which Mrs. Siddons astonished him as Elvira, and so

much charmed him, that he imitated her manner, accents, and attitudes, in various dramatic speeches which he learned for the purpose, and declared that he should die if he were not permitted to be a player. The stage-struck child was taken by his parents to the manager of the theatre, who, after hearing him recite, placed him under the able instruction of Mr. Hough, the prompter. Under this gentleman he studied the parts of Osman, young Norval, Rolla, and Romeo, and made his *début* at the Belfast theatre, Aug. 1, 1808, in that of Osman. At this time he was not twelve years old. His success was decided, and after playing the above-named parts at Belfast, he performed at Cork with even greater effect, and was enthusiastically received at Glasgow and Edinburgh. At the latter place, Home pronounced him to be "the genuine offspring of the son of Douglas." From this time he travelled over England, with still augmenting fame and profit, as "the young Roscius." In 1804 he was engaged at Covent-Garden theatre, London, for 12 nights, at 50 guineas a night, and a clear benefit—undertaking to play at Drury Lane, on the intervening nights, on the same terms. At that very time, John Kemble's weekly salary was under 36 guineas, and Lewis had only £20. "The young Roscius" opened at Covent Garden, Dec. 1, 1804, as Achmet, in "Barbarossa," was enthusiastically received, played with much self-possession, and remarkably well—for a child. He drew immense houses in several characters, Hamlet included; was presented to George III., the royal family, and the leading nobility; received numerous and valuable presents; had Opie and other artists pressing him to sit for his portrait, and engravers busily employed in multiplying them; and so great was the Rosciomania, that even the university of Cambridge so far went with the tide of the boy's celebrity, as to make "Quid noster Roscius eget" the subject of Sir William Brown's prize medal. It was proposed to erect statues of him. In 28 nights, at Drury Lane, he drew £17,210, an average of £614 a night, and at least as much more at Covent Garden. A youth of thirteen who could draw £34,000 in 56 nights, must have had great merit or great luck. After he had rapidly realized sufficient to secure himself a handsome independence for life, Master Betty retired from the stage in 1807, and was placed for 3 years at Shrewsbury school. He resumed his profession at Covent Garden in 1812, at the age of 21; but the charm was ended; the performance was considered as very commonplace, and was not repeated. Lord Byron prophesied before the reappearance that he could not succeed, his figure being fat, his features flat, his action ungraceful, and no expression in his "muffin face." He permanently retired to private life, and has brought up a large family very respectably.—HENRY BETTY, his eldest son, born Sept. 29, 1819, was also seized with a passion for acting, and after several years' practice in the provinces, appeared

at Covent Garden in Dec. 1844, as Hamlet. He reminded old play-goers of "the young Roscius" in his prime, and is a very respectable, although not a first-class performer.

**BETWAH**, a river in Hindostan, which takes its rise in the Vindhyan mountains, near Bhopaul, and flowing nearly 840 miles in a N. E. direction through the provinces of Malwah and Allahabad, finally joins the Jumna below Kalpee. Near Erech a slight fall occurs. The country through which it flows is highly cultivated. The river at times is said to rise to a great height; in a portion of its course it flows through beds of iron ore.

**BEUDANT**, FRANÇOIS SULPICE, a French mineralogist and natural philosopher, born at Paris, Sept. 5, 1797, died in the same city, Dec. 9, 1850. After having taught successively in the polytechnic school and the normal school, he became in 1811 professor of mathematics in the lyceum of Avignon, and in 1818 professor of physics in the lyceum of Marseilles. He had devoted his studies to zoology, and already published some curious observations and experiments concerning the mollusks, when in 1815 he was sent by Louis XVIII. to England, to take charge of the transportation to France of that monarch's mineralogical cabinet, of which he was appointed director, and from this time he made the mineral kingdom the chief object of his study. In 1818 he made a tour to Hungary for mineralogical and geological observations, and on his return to Paris succeeded Hatty, who had been his master, in the faculty of sciences, became a member of the academy of sciences, and inspector-general of the university. He published numerous works, among which were accounts of researches concerning the relation of crystalline forms to chemical composition, and of his observations in Hungary, elementary treatises on mineralogy and geology, and also a remarkable grammar of the French language.

**BEUGNOT**, ARTHUR AUGUSTE, count, a French historian and archaeologist, born March 25, 1797, at Bar-sur-Aube. He was bred to politics, and occupied a seat in the chamber of peers under Louis Philippe. He was a constant advocate of freedom in public instruction; the revolution of 1848 sent him to the legislative assembly, where he was instrumental in the adoption of a liberal measure on that subject. He has now given up politics for literature, and is engaged in superintending some of the valuable historical publications of the French government.

**BEUGNOT**, JACQUES CLAUDE, count, a French statesman, born in 1761, at Bar-sur-Aube, died in June, 1835. In the legislative assembly he distinguished himself by bold opposition to the revolutionists; he was especially eager in assailing Marat. This made him so unpopular that, after Aug. 10, he did not dare to appear in his seat. Being arrested in 1793, he was liberated by the revolution of the 9th Thermidor, and lived then in retirement till the 18th

Brumaire, when he was made assistant to Lucien Bonaparte in the home department. In 1807 he took part in the organization of the newly created kingdom of Westphalia, being for a while appointed minister of finance. In 1808 he was administrator of the grand duchy of Berg and Cleves. When the Senate declared the right of Napoleon to the French empire forfeited, Beugnot was nominated to the home ministry by the provisional government. On the arrival of Louis XVIII., he was appointed director-general of police, then minister of the navy, and being faithful to his new master, he followed the king to Ghent. After the battle of Waterloo he was for a while postmaster-general. In 1824 he resigned his seat in the chamber of deputies. The revolution of July confined him to private life.

**BEUKELS**, WILLEM, a Dutch fisherman, was born at Biervliet, in Dutch Flanders, in 1397, where he died in 1449. He discovered the method of preserving herrings. A statue was erected to his memory by Charles V.

**BEURNONVILLE**, PIERRE DE RUEI, marquis de, marshal of France, was born at Champignolle, in Burgundy, May 10, 1752, died April 23, 1821. Originally intended for the church, he chose the profession of arms and served in the East until 1789, when he was sent home by the governor of the Isle of Bourbon, his temper being quarrelsome. Arriving in Paris at the commencement of the revolution, he identified himself at once with it, and in 1792 was appointed aide-de-camp to Marshal Luckner, and was soon after named general-in-chief of the army of the Moselle; in 1793 he became minister of war. Sent in 1793 to arrest Dumouriez, he was himself arrested by Dumouriez, and confined at Ehrenbreitstein, Eger, and Olmütz until 1795, when he was exchanged, and became successively general-in-chief of the army of the north, inspector-general of infantry, ambassador to Berlin in 1800, to Madrid in 1802, and count of the empire. In 1814 he was commissioned by Napoleon to organize means of defence upon the frontier, and on the abdication of Napoleon was named minister of state and peer of France by Louis XVIII. On the return of Napoleon to Elba, he was proscribed by a special decree, and retired again, but was reinstated in all his dignities by Louis XVIII. after the battle of Waterloo. He became marshal of France in 1816, and marquis in 1817.

**BEVEDERO**, a lake in La Plata, province of Mendoza, consisting of 2 distinct bodies of water, called the greater and lesser Bevedero, connected by a river about 8 miles long. The greater is 40 miles in length from N. to S., and from 8 to 25 in width. The lesser measures about 22 miles by 15. The lake lies between lat. 32° 45' and 34° 17' S., and long. 66° and 66° 32' W.

**BEVEL**, in carpentry, an angle differing from a right angle; also, a tool like a T, of 2 pieces, capable of being fastened at any angle.

**BEVELAND**, North and South, 2 islands be-

longing to Holland, in the province of Zealand, and formed by the mouths of the Scheldt. North Beveland lies east of the island of Walcheren, and is separated from South Beveland by the island of Wolfersdyke. South Beveland, the larger and more fertile of the 2, contains Goes, the capital, and several forts and villages. The united area of the islands is 120 sq. m.

**BEVERIDGE, WILLIAM**, an English prelate and theologian, born at Barrow, Leicestershire, in 1688, died March 5, 1708. At the age of 20 he published an able Latin treatise on the Hebrew, Chaldee, Syriac, Arabic, and Samaritan languages. In 1681 he became archdeacon of Colchester; in 1684, prebend of Canterbury; and, at the revolution of 1688, chaplain to William and Mary. He declined the bishopric of Bath and Wells on the deprivation of Bishop Kenn for non-juring, but in 1704 he became bishop of St. Asaph. He published in his lifetime a "Treatise on Chronology," a learned work on the "Canons of the Greek Church to the Eighth Century," beside various minor works. In 1824 the life and writings of Bishop Beveridge were published in 9 vols. 8vo, by the Rev. Thos. Hartwell Horne.

**BEVERLEY, JOHN** or, an Anglo-Roman saint, archbishop of York, born at Harpham, Northumberland, near the middle of the 7th century, died at Beverley in 721. He was a man of erudition and tutor to Bede, and was canonized 8 centuries after his death. His name, like that of Pindar, saved his native place from being ravaged by a conqueror—William the Norman spared the place for his sake. He founded a college at Beverley and wrote several works.

**BEVERLY**, a thriving post-town of Essex co., Mass., opposite Salem, with which it is united by a bridge, and 16 miles N. N. E. of Boston, on the eastern R. R. The inhabitants are chiefly engaged in commerce, and in the fisheries. It has, however, manufactures of carriages, britannia ware, and cotton and woollen fabrics. The village contains a bank, a weekly newspaper, an insurance office, and an academy. A branch railroad connects it with Gloucester. Pop. in 1855, 5,944.

**BEVERLY, ROBERT**, historian and clerk of the council of Virginia, died in 1716, is noted only for having written a history of Virginia, embracing an account of its first settlement, government and productions, with remarks upon the Indians of the province, their religion, manners, and customs, published in 1705.

**BEVERWYK**, a town of the Netherlands, in north Holland, 7 miles north of Haarlem, at the head of the Y, an outlet of the Zuyder Zee. Pop. 2,252. The invasion of England by William of Orange, in 1688, was planned in the vicinity.

**BEWICK, THOMAS**, reviver of wood-engraving in England, born at Oherryburn, near the village of Ovingham, Northumberland, Aug. 12, 1753, died Nov. 8, 1828. He was apprenticed, at 14, to Mr. Ralph Beilby, engraver, at Newcastle-on-

Tyne. Having executed, in wood, the diagrams for Hutton's treatise on mensuration (published in 1770) and other scientific works, he soon after attempted something better, and, at the age of 22, obtained from the society of arts a premium for his wood-engraving of the "Old Hound," one of a series of illustrations to Gay's fables. This success encouraged him, and, some years later, he illustrated a volume of select fables, by Mr. Saint. In 1790 the first edition of the "History of Quadrupeds," illustrated, was published by Mr. Beilby, who had received him into partnership. The designs in this, as well as in Bulmer's editions of Goldsmith's "Deserted Village" and Parnell's "Hermit," were drawn and engraved by Thomas Bewick and his younger brother, and pupil, John. Their beauty, novelty, and admirable execution attracted general attention, and George III. would not believe they were wood-cuts until he was shown the blocks. Somerville's "Chase" was the next work. All the engravings were by Thomas and the designs by John Bewick, who died of consumption, in 1796, the year it was produced. Thomas Bewick, who was now recognized as possessing a great deal more than mere skill, produced the first volume of his "British Birds," containing the land birds, in 1797. It ranks as the finest of his works. The 2d volume appeared in 1804, about which time the partnership with Mr. Beilby was dissolved. He published select fables by Æsop and others, illustrated, in 1818, after which he was busy preparing for an illustrated history of fishes, which never was completed. Among his pupils, who were numerous, Luke Clennell and William Harvey have most distinguished themselves.

**BEX**, a small but beautifully situated town of Vaud, Switzerland, on the right bank of the Rhone, 12 miles above its entrance into the Leman; pop. 2,854. It is much frequented by tourists, in the summer. It was long famous as being the only place where salt was deposited in Switzerland.

**BEXAR**, a province of the Spanish colony of Texas, now a county of the state of Texas. Under the colonial government Texas was, in 1688, divided into 3 prefectures, of which Bexar was the westernmost, and first of all colonized by missions and military posts, and, in 1718, by a colony of a dozen Spanish families, from the island of Madeira. At that time, and up to the creation of the independent state of Texas, Bexar contained over 100,000 sq. m., with the following thinly peopled settlements: San Antonio, with the missions of San José, San Espada, San Miguel, and Concepcion, and that of the Alamo; Laredo, Palafox, Corpus Christi, Victoria, Gonzales, and a few villages opposite El Paso. San Antonio de Bexar was the seat of the provincial government, and, for some time, of the colonial government of Texas. At different times, the frontier of Bexar toward Tamaulipas and Coahuila was different, now the Nueces and then the Sierra Madre being regarded as the boundary, so that por-

tions of these two states belonged to Texas. Under the republican government Bexar was one of the earliest organized counties, and out of its territory were gradually taken over 80 of the present 105 counties of Texas. The public domain of Texas is divided into 8 different land districts, of which Bexar with its ancient boundaries is one. San Antonio, its capital, is the seat of one of the 8 Texan land offices, where the largest transactions in landed property in Texas are made. The population of the county of Bexar, in 1855, has been estimated at about 20,000, of which nearly one-half was in the city of San Antonio, being composed of about 6,000 Germans, 8,000 Mexicans, 5,000 Americans, 1,000 negroes, and a few hundred Frenchmen, and Indians of the Lipan tribe, now extinguished, and of the Mescalero tribe, now settled out of the county. In 1857, the "Texas Almanac" states the white population at 12,117, Mexicans 2,000, with 1,079 negroes. The county comprises an area of 8,960 square miles. Its surface is undulating and beautifully diversified. Prairies occupy about  $\frac{1}{4}$  of the land, and timber grows along the water courses. The soil is generally sandy; the uplands are chiefly valuable for pasturage, but the river bottoms are highly fertile, producing corn and sweet potatoes. In 1850 the county yielded 82,975 bushels of Indian corn, 2,865 of oats, 1,968 of potatoes, 18,761 pounds of butter, and 5,225 of wool. There were 2 churches, 2 newspaper offices, and 114 pupils attending public and other schools. In 1857 there were 39,009 head of cattle, valued at \$277,860, and 3,798 horses, valued at \$123,820; the value of real estate was \$3,898,280, and the aggregate value of all taxable property, \$5,059,926. A railroad has been projected from San Antonio, the county seat, to Powder Horn, and one from San Antonio to the gulf of Mexico was commenced about 1856.

BEXLEY, LORD (NICHOLAS VANSITTART), an English statesman, born April 29, 1766, died Feb. 8, 1851. His father, descended from a German family, was an East India director, who perished at sea, in the frigate *Aurora*, bound for India, in 1771. Educated at Oxford, where he graduated in 1787-'8, Mr. Vansittart studied the law, and was called to the bar in 1791. He had scarcely any practice, but wrote several pamphlets, including letters to Mr. Pitt, in 1795, on the conduct of the bank directors. Abandoning the hope of success at the bar, and possessing an independent income, he became member of parliament for Hastings in 1796. By his speeches and tracts, he obtained the notice of ministers, and was sent, in Feb. 1801, on a special diplomatic mission to Copenhagen, but the Danish government, awed by Russia and France, refused to receive a British minister. Soon after his return, he was made joint secretary of the treasury, which office he held until 1804, when the Addington cabinet resigned. After this he was successively Irish secretary, secretary to the treasury, chancellor

of the exchequer, and chancellor of the duchy of Lancaster. When he ceased to be financial minister (after having held that office for 11 years), he was raised to the peerage as Baron Bexley, of Bexley, in Kent. He retired from public life in 1828, on a pension of £3,000, which he enjoyed for the remaining 28 years of his life. As he had no child, by his marriage with the first Lord Auckland's sister, the title became extinct at his death.

BEY. See BEE.

BEYKANEER, BEEKANEER, or BICKANEER, one of the states of Rajpootana, in the N. W. of Hindostan, between lat. 27° 30' and 29° 55' N., and long. 72° 30' and 75° 40' E.; area 17,676 sq. m.; pop. said to be 539,250. It is bounded N. by the British district of Butteana, E. and S. E. by the native state of Shekawuttee, S. by Joodpoor, and W. by Jessulmeer and Bahawalpoor. The greater part of the province is a barren, sandy desert. There are no running streams, and water is only obtained by sinking wells to an immense depth. Grain is imported, but horses, bullocks, and camels are raised in great numbers. The chief towns are Beykaneer, the capital, and Chooroo; the former, situated in the middle of a sterile plain, in lat. 28° N., long. 78° 22' E., is surrounded by lofty, white walls, and consists chiefly of mud huts painted red; pop. about 60,000. Chooroo, though lying among sand-hills, is a handsome town, the houses constructed of white limestone. The rajah of Beykaneer acknowledges the sovereignty of the British government. He maintains an army of 5,000 men, and his revenues amount to £65,000 per annum.

BEYLE, HENRI, a French author, more widely known under the pseudonyme of Stendhal, born in Grenoble, Jan. 28, 1783, died in Paris, March 23, 1842. Under different fictitious names he published several works more or less important in art and literature, viz.: "History of the Italian School of Painting," the lives of Haydn, Mozart, Metastasio, and Rossini, a "Study on Racine and Shakespeare," "Rome, Naples, and Florence;" *Promenades dans Rome*, &c., &c. A volume of his, entitled *De l'amour*, excited a good deal of curiosity at the time, and is yet read with a lively interest. But the most remarkable of his writings were two romances: *Le rouge et le noir*, and *La chartreuse de Parme*, the latter, a novel of Italian life, being considered generally as one of the most remarkable works of modern French literature. Some critics, among whom was the celebrated H. de Balzac, proclaimed it to be a masterpiece. No Frenchman ever knew Italy more thoroughly than Henri Beyle. Perfectly familiar with the language, so as to write in Italian a pamphlet (*Del romanticismo nelle arti*); passionately fond of that beautiful and interesting country, where he spent many years of his life; acquainted as well with the history of its past as with the characteristics of its present condition; endowed with a clear intellect and warm feeling in every matter of art; a bold thinker

and free writer; he seemed to be the very man to win at once a high position in the literary world. Still, whether because of the different names affixed to his books, or from the nature of his genius being congenial only to the few, he was more appreciated and honored after his death than during his life. His principal works did not attain a real popularity even in his own country, until they were reprinted, including, beside those above mentioned, a volume of Italian chronicles and tales: *L'abbesse de Castro; Les Cenci; Vanino Vanini, &c.*, gathered from the *Revue des deux mondes*, where they were first published.

BEYRAMIOH, the capital of the district of Troas, in Asia Minor, distant about 60 miles from the Dardanelles. It is a large town, regularly laid out, and well built. Many antiquities are to be seen in the neighborhood, including several monolithic granite sarcophagi.

BEYROOT, or BAIBOUT, the ancient Berytos, a flourishing seaport of Syria, on the river of the same name in the pashalic of Acre; pop. with the suburbs, 80,000. It traces its foundation to the Phœnicians, occupies a place in Roman and Jewish history, and was a school of law in the time of Justinian. It had its share in the vicissitudes of the crusades, and is the scene of the victory of St. George of Capadocia over the dragon. The modern Beyroot was built and restored by Djezzar Pasha, and considerably strengthened by order of the late Mehemet Ali. When he seized on Syria, the town sustained a bombardment, and was defended by Solymán Pasha, supported by Ibrahim Pasha with an army in the field; and on its evacuation, the allies landed and defeated the latter. The town is situated at the commencement of a plain backed by the ranges of Lebanon. The surrounding country is productive, and supplies of all kinds are abundant and cheap. The bay is large, with good anchorage.

BEYS, GILLES, a printer in Paris, died April 19, 1593, was noted for being the first to make a distinction in printing between the letters *i* and *j*, and *u* and *v*.

BEZA, or BESZE, THÉODORE DE, an eminent theologian and scholar of the 16th century, born in Vézelay, France, June 24, 1519, and died at Geneva, Oct. 18, 1605. Descended of noble parents, in affluent circumstances, and educated from early life by the profoundest scholars of the age, young Beza found himself at the age of 20 years a thorough Greek scholar, a licentiate of the civil law from the school at Orleans, and thrown upon an exciting life at Paris, with a fortune of 700 crowns a year from 2 church benefices, with a large addition from the death of an elder brother, and the prospect of a still greater one from the resignation of a church living in his favor by an uncle; for although he had been educated by Wolmar, his tutor, in the Lutheran doctrines, he contrived to quiet his conscience with his church crowns, and did not avow his faith until a later period. His

enemies in after life, when he took his stand as a reformer, averred that his life at Paris was any thing but creditable to his moral character. It is certain that he wrote and published amorous verses, and formed a secret marriage relation in order not to lose his church stipends. Of more than this it is difficult to accuse him with proof. But Beza's conscience was quickened, under an alarming disease, to an activity from which his pecuniary relations to the church had deterred it in health. On his recovery, in Oct. 1548, he went to Geneva, avowed at once and the same time his wife and his faith, and henceforth became an able advocate of the reformed religion. He seems to have incurred some censure in the early part of his career as a reformed controversialist, on account of a certain levity of manners which was probably the result of his Parisian life, passed, as it was, in the higher circles both of literature and fashion. But his brilliant talents and ardent zeal for the Lutheran doctrines gave him at once a high position in the reformation, which he preserved to the end of his life. He was elected professor of Greek at Lausanne, and from his contiguity to Geneva, used frequently to hear Calvin. A strong intimacy soon grew up between them. At Calvin's instance, Beza, while at Lausanne, completed Marot's version of the Psalms, and wrote a defence of the execution of Servetus, in which he supported the right of punishing heresy by the civil power, an opinion which he very much modified in his later days. In the growing division between the Lutherans and the Calvinists, Beza assumed the side of his patron and friend, the Genevan professor, whose professional chair he so soon came to support as Calvin's assistant lecturer, and finally was appointed rector of the newly organized university. During the persecution of the French Protestants, Beza undertook to influence the king of Navarre favorably for the reformed party, and was successful. As the result, the conference of Poissy was called in 1561, to attempt a reconciliation of the Protestant with the Catholic party. The edict of toleration promulgated in January of the following year, made it safe for Beza to proclaim the doctrines of the reformation in Paris, whither he had repaired at the solicitation of Oatharine, who thought his native country had a better right to his talents than Geneva. But the massacre of Vassy put an end to his prospects in France. He espoused the cause of the prince of Condé in the war that followed, and at its close returned to Geneva, where he took the chair of theology vacated by the death of Calvin. From that time he may be regarded as the head of the Genevan church, whose relations to the Lutheran party had now become sufficiently distinct. He was a diligent writer, as the catalogue of 59 works collected by one of his biographers abundantly attests. Among these works were many requiring great research and patient labor; among which may be mentioned his Latin translation of the New Testament, and his treatise on church polity,

which was the result of a correspondence between himself and the lord chancellor of Scotland on the revision of the Scotch ecclesiastical law, known as the "Second Book of Discipline." The name of Beza also deserves honorable mention in that sudden and powerful movement in Italy and France in the 16th century, celebrated as the *Renaissance*.

BEZA'S CODEX, an ancient MS. containing the Four Gospels and the Acts of the Apostles, written in Greek and Latin, on opposite pages. This MS. is in square uncials on vellum, and in quarto form. It has many chasms both in the Greek and Latin text. Many parts of the MS. are legible only with difficulty, indicating either great age, or want of proper care in preservation; probably the former, for there are other good evidences of the extreme age of this MS. The Latin version is the *Vetus Italia*, or the old Latin before its revision by Jerome, and his revision was made toward the close of the 4th century. To be sure, it does not follow that this MS. was written before the Jerome version (and most critics have refused to assign it so great antiquity); but in a fac-simile edition of the Oodex Bezae published in 1793, at the expense of the Cambridge university, to whom it belongs, the editor claims for it a still greater antiquity on this ground, and also for the additional reasons that: 1, the MS. has the Ammonian sections; 2, it has not the Eusebian canons; 3, it lacks also the doxology at the end of the Lord's prayer. The bearing of these reasons on the antiquity of the MS. is briefly this: The Ammonian sections were a product of the 8d century, and the Eusebian canons of the 4th, while the interpolation of the doxology is of a still later date. But all these considerations plainly go for nothing. Hence the editor maintains that even the Ammonian sections were added by a later hand. This, he claims, would seem to indicate that the MS. was written before the sections, and when the sections were produced, they were added to the MS., and in the interim between the sections and the canons. It is evident that all this establishes no basis on which to rest a claim of antiquity for this MS., which shall throw it back of the 6th century, to which, with general consent, it is assigned by paleographers. Some consider the whole thing an English forgery. The editor maintains the opinion that it was originally written in Egypt, while others think that it is the work of some western Latinist. It has been charged with a marked conformity to the Anglo-Saxon version, which would make it a comparatively modern production. But the editor claims that its resemblance to the Syrian version is equally great. After all, the matter is of slight importance to Biblical literature, as not much stress has ever been laid upon this Codex Bezae. Beza presented it to the university of Cambridge in 1581. From the donor it has received its name, though sometimes it is designated, from its present ownership, *Codex Cantabrigiensis*. Beza says it was found in the

monastery of St. Irenaeus, in Lyons. It is without punctuation.

BEZANT, a round unstamped gold coin, without impress or legend. It was brought into European circulation by the crusaders, but had probably been current in Venice, which had a large eastern commerce, before that time. It is supposed to have been the ordinary coin of the later Byzantine empire, and its name Bezan, *quasi* Byzant, records its origin. Its sterling value was 9s. 4½d., or about \$2 American currency.

BÉZIERS, a French city, department of Hérault; pop. in 1856, 28,557. It is the seat of a bishopric, has a Gothic church, college, and cavalry barracks, an aqueduct of Roman origin, and the ruins of a Roman amphitheatre, a public library, a tribunal of commerce, manufactories of silk stockings and gloves, cloth, brandy, parchment, verdigris, vinegar, and wine. It has a considerable commerce in tropical fruits, cork, and sardines. The Languedoc canal runs near it. In Roman times the town was called *Baterra*, also *Colonia Septimanorum*. The Visigoths, Saracens, and Franks possessed it in turns. The count of Septimania, who resided at Béziers, declared his independence in the 10th century, and then put himself under the protection of the county of Barcelona. In 1258, it was ceded to Louis IX., king of France. In 1209, this city was the scene of an Albigensian massacre. In the religious wars of the 16th and 17th centuries, it suffered much. An ecclesiastical synod was held here A. D. 856, to consult about the Arians. In the 13th century many synods were held here in consequence of the religious fermentation of the neighborhood.

BEZOAR (Persian *pasar*, a goat, or *pasachar*, against poison), a substance formerly used for medicinal purposes. It is a concretion, consisting chiefly of bile and resin, and is met with, as a calculus of a round or orbicular form, in the stomach, the intestines, the gall bladder, the salivary ducts, and even in the pineal gland, but mostly in the intestines of certain animals of the order ruminantia. They were once celebrated for their supposed medicinal properties, distinguished by the names of the animals in which they were found, or the countries from which they were brought, and eagerly bought for ten times their weight in gold. Beside being taken internally as medicines, they were worn around the neck as preservatives from contagion. It was customary in Portugal to hire them at the price of 10 shillings per day. Modern investigation and experiment have destroyed the charm of these wonderful calculi.

BHADRINATH, a town in northern Hindostan, situated on the right bank of the Bishengunga, celebrated for its temple of Vishnu, with a hot mineral spring in whose waters both sexes bathe indiscriminately, to wash away their sins. Some 50,000 pilgrims visit the place annually. The temple has been frequently overthrown by earthquakes. The principal idol is a figure of black marble, clothed in gold and silver

brocade while the season of pilgrimage lasts, and then stripped and stowed away in a vault the rest of the year. The Hindoos believe that in the neighboring mountains some holy anchorites have lived for several thousand years. Their place of habitation is a cavern perpetually choked with snow, which forbids the approach of the curious and the sceptical. The Bhadrinath peaks in the neighborhood are above 22,000 feet high.

BHAGAVAT-GITA, (divine song, or Krishna's revelation, *Σεπείσιον μῆλος*), or simply *Gita*, is the most important of the episodes of the *Mahabharata* (great India, so named from Bharata, the son of Dushyanta by Sakontala, being his patrimony), which is the second sacred Itihasa (traditional heroic history or epos, of the ancient Hindoos, the first being the *Ramayana*, or Rama's dwelling, by the poet Valmiki), written in the Sanscrit (concrete, perfect) language, about 4,000 years ago, by *Veda Vyasa Rishi* (science-collecting patriarch), who also collected the scattered leaves of the 8 older genuine Vedas (science of religion) and the older Puranas (ancient myths). The *Mahabharata* contains the legendary history of the Bharata dynasty, especially the wars between the Pandus and Kurus, the 2 branches of the progeny of the moon. Five Panduvi brothers, having been unjustly exiled by their uncle, return, after many wonderful adventures, with a powerful army, against the 100 Kurus, and, being aided by Krishna (the 8th avatar or incarnation of Vishnu, one of the Trimurti or trimorphy, trinity, proceeding from Bram, his milder form, descended from heaven in the beginning of the Kali-yuga, or counted age—viz., the present age of vice and of iron—about 5,000 years ago, for the redemption of mankind), defeat their more numerous host, on the plains of Kurukshetra, near Delhi; thus becoming the lords of India, from Persia to China, and from the Himalaya to Kanyakumari (virgin's cape, now Comorin). Anquetil du Perron supposes the *Gita* to be an independent work; and it is, indeed, absent from several manuscripts of the *Mahabharata*, in some others different from its other parts, and unconnected with them in the sixth book. The aim of this metaphysical, dogmatic, and ethical work appears to have been the union of all worshipers, and the abolition of the idolatrous Vedic dogmas. Though not polemic against the prejudices of men, it offers eternal bliss to true Brama-adorers, while it sends the worshippers of *Devas* (lower gods, angels) to the lower temporal heaven, if they deserve it. On the whole there is an inkling of Buddhism in this magnificent Thespian poem, containing all the grand mysteries of the Braminic religion. It consists of 18 sections on the following subjects: 1, grief of Arjuna (gainer, the 8d son of Pandu, called also son of Bharat, of Kunti; favorite disciple of Krishna, after whose ascension to heaven he is inconsolable, although appointed executor of the revelation); 2, nature of the soul,

speculation; 3, works; 4, forsaking of works; 5, forsaking of the fruits of works; 6, exercise of the soul; 7, principles of nature, vital spirit; 8, purush (mankind); 9, chief of secrets, prince of science; 10, diversity of divine nature; 11, display of divine nature in the forms of the universe; 12, serving God in his visible and invisible forms; 13, explanation of *Kahattra* (defender, warrior; man of the second or regal class) and *Kahattriya*; 14, 8 *gun* (qualities); 15, *purushottama* (excellent man); 16, good and evil destiny; 17, 8 species of faith; 18, forsaking the fruits of action, for attaining eternal salvation.—Pantheistic, unitarian, and antivedic, it is kept secret from the vulgar castes by the jealous and overbearing Bramins, who dread lest by its tenets becoming popular they might lose their own control over the minds of the people. The form of the work is a dialogue between Krishna and Arjuna, reported by one Sanjaya to Dhrisharashtra, one of the Kurus. Arjuna does not wish to fight his kindred and bosom friends, but Krishna urges him to do this as his highest duty. This takes place on a splendid chariot drawn by white horses, standing between the 2 hostile armies, just before the battle. "Wise men are only sensible to duty, and not to pleasure or pain. I (Krishna) formed all existing things, clothing the incorruptible soul in the city with 9 gates (viz., the body, with 9 openings for the admission of external things), the which is corruptible. If slain, thou (Arjuna) wilt go to heaven; if victorious, thou wilt gain the world. Think not of consequences in acting. Be unselfish, subdue your senses and passions, which obscure reason and lead to deceit. Low men follow examples, great men give them. The wise does things homogeneous to his nature. He who follows me is saved by wisdom and even by works. As often as virtue declines in the world, I make myself evident to save it. The soul ought to free itself from the bonds of action and act absolutely according to its divine origin. There is but one God, all other *Devas* being inferior and mere forms of Bram or of myself. Worship by deeds predominates over that by contemplation. The mortifications of the Sannyasin (4th or mendicant order of Bramins) and of the *Yogi* (joined to God), are subordinate to those of the *Tyagin* (renouncers), who work, but forsake the fruits of their deeds and go immediately into Bram," &c., &c. The *Gita* was translated into English by Charles Wilkins in 1785. The *Bhagavat-Purana* is the 18th and last of the *Puranas*, containing the history of Krishna; it was translated into French by Eugène Burnouf, Paris, 1840.

BHAMO, a town of Burmah, situated on the Irrawaddy, 40 miles W. of the Chinese frontier, and 180 miles N. N. E. of Ava. It is the centre of the trade with China, receiving woollen, cotton, and silk fabrics, by the winter caravans, from that country. The Shan tribes come hither to exchange their produce for salt, rice,

and dried fish. Bharno has some 2,000 houses, chiefly occupied by Chinese.

**BHATGAN**, or **BEARGONG**, a town of northern Hindostan, in the valley of Nepal, lat.  $27^{\circ} 87' N.$ , long.  $85^{\circ} 22' E.$  It is the favorite residence of the Bramins of Nepal, and is said to contain valuable Sanscrit libraries. It has about 12,000 houses, of a description superior to those found in most of the cities of Nepal.

**BHAVANI KUDAL**, a town of British India, in the presidency of Madras, at the junction of the Bhavani and Cavery rivers, containing famous temples of Vishnu and Siva.

**BHEELS**, one of the rude tribes of Hindostan, inhabiting chiefly the mountains of Candeish, and the wild country along the Nerbudda and Taptee. They are spare but active, and of dark complexion. They are addicted to robbery and disorder, and the British government have endeavored to reclaim them by organizing a military corps from among them, and subjecting the district to strict police. They, together with the Coolies and Ghoonds, are believed, upon good authority, to have been the aborigines of India, driven out of the plains into their mountain fastnesses by the invasion of the Hindoos. The Bheels joined in the great Indian mutiny of 1857-'58, and met the British in several battles. Lieut. Henry, the superintendent of police, was killed in an attempt to dislodge them from a strong position in Candeish, and another engagement, fought Jan. 20, 1858, near the frontier of the nizam's territory, where the Bheels had mustered in great force, resulted in the loss of 50 European troops.

**BHIRJAN**, a town in the eastern part of Persia, situated 180 miles S. of Meshed, in the desert. It contains about 5,000 houses, of brick, a citadel, governor's palace, caravansaries, mosques, and baths. Carpets of excellent quality are made here.

**BHOOL**, a strongly fortified city of Hindostan, capital of the province of Cutch, lat.  $23^{\circ} 15' N.$ , long.  $69^{\circ} 52' E.$ , 85 miles N. of the gulf of Cutch; pop. about 20,000. It is enclosed by a strong wall of stone, flanked with towers, and contains a castellated palace, a mausoleum, and several temples. Bhoof is famous for its manufactures of gold and silver.

**BHOPAL**, or **BOPAL**, an Indian state in Malwa, presidency of Bengal, between lat.  $22^{\circ} 32'$  and  $23^{\circ} 46' N.$ , and long.  $76^{\circ} 25'$  and  $78^{\circ} 50' E.$ ; area, 6,764 sq. m.; pop. 666,872. It is ruled by a nawab, with a revenue, in 1843, of £220,000. The Vindhya mountains traverse the province. Bhopal has a fertile soil, and is well watered by the Nerbudda, and several smaller streams. The capital, of the same name, is surrounded by a stone wall, much dilapidated from neglect. In common with nearly every part of Bengal, this state witnessed a rising of the sepoys against their British rulers, in 1857. Gen. Rose marched against the mutineers, and disarmed them at Seehore, Jan. 12, 1858. About 150 were tried by court-martial and shot, while many others were killed in trying to escape.

**BHOWANIPPOOR**, a village of Hindostan, in the Bengal presidency, 96 miles W. of Dinagepoor. A fair is held here annually, in April, often attended by 100,000 persons.

**BHURTPPOOR**, a state of Hindostan, lying between lat.  $26^{\circ} 48'$  and  $27^{\circ} 50' N.$ , and long.  $76^{\circ} 54'$  and  $77^{\circ} 49' E.$ , bounded on the N. and N. E. by the British district Goorgaon, S. E. and S. by the Gwalior dominions, and W. by Macherry; area, 1,978 sq. m.; pop. estimated at 600,000. Yearly revenue of the rajah, £170,000.—Bhurtpoor, the capital, 33 miles W. of Agra, is nearly 8 miles in circuit. The fort was formerly considered a place of great strength, and with the town was surrounded by a mud wall and wide ditch. Lord Lake made 4 attempts to storm it in 1805, without success, losing in the several attacks over 8,000 men. It was, however, finally surrendered by the rajah, who feared to prolong the defence. Lord Combermere stormed Bhurtpoor in 1826, having first destroyed a part of the wall by mining. The fortifications were afterward dismantled. Throughout the sepoy rebellion of 1857-'8, the city remained in the hands of the British.

**BIAFRA**, a kingdom in the western part of Africa, on the bay or bight of the same name, in upper Guinea, between the kingdom of Ouari and the river Gaboon. It is intersected by numerous wide river channels, which are the outlets of the river Niger, and the country between Benin and the capital town Biafra forms the delta of the Niger. The tract near the shore is low and swampy, but in the interior is the elevated region of the Cameroon mountains; the principal rivers are the Gaboon, Cross, and Malinda, and the place most resorted to by European traders is George's town or Naango, on a creek of the Gaboon, about 45 miles from the sea. Lander was the first to demonstrate the existence of several mouths to the Niger, since in descending that river he left the main channel and arrived by a branch in the bight of Biafra.—**BIGHT OF BIAFRA**, an inlet of the Atlantic, forming the eastern part of the gulf of Guinea, on the western coast of Africa, between long.  $5^{\circ}$  and  $10^{\circ} E.$ , and extending from Cape Formosa on the N., to Cape Lopez on the S. It contains the islands of Fernando Po, Prince, and St. Thomas, and receives the waters of the Cameroons, Malimba, Mooney, Old Calabar, and several other rivers.

**BIAGIOLI**, **NICOLÒ JOSAPHAT**, an Italian linguist and critic, born near Genoa in 1768, died Dec. 13, 1880. At the time of the Austro-Russian invasion of Italy, in 1798, his patriotism rendered him obnoxious, and he was driven from his professorship and forced to abandon his country. He then retired to Paris, where he immediately obtained a professorship, and in that office delivered a course of lectures on the poets and prose-writers of Italy, which drew crowds of hearers. His annotated editions of Dante, Petrarch, and Michel Angelo, are highly esteemed.

**BIALYSTOK**, a province of western Russia,

in the ancient kingdom of Poland, between lat. 52° 8' and 53° 38' N., and long. 22° 30' and 24° 12' E. It is bounded N. and W. by Poland, and S. and E. by the Russian province of Grodno; area, 3,424 sq. m.; pop. 227,106. Its surface is flat, studded with sandhills, formerly densely wooded; climate temperate and moist.—The capital is of the same name. It lies on the little river Bialy; pop. 9,217.

BIANOHI, FRANCESCO, called *Il Frari*, an Italian painter, born at Modena, in 1447, died in 1510. He was the instructor of Correggio, according to Vidriani, and his works were esteemed for graceful design and agreeable coloring.—FEDERIGO, an Italian painter, born at Milan, toward the close of the 16th century. His paintings are numerous in Milan, and throughout northern Italy, and are held in high esteem. He wrote a volume of biographies of painters.

BIANCHINI, FRANCESCO, an Italian astronomer and antiquary, born at Verona, Dec. 13, 1662, died in Rome, March 2, 1729. He was greatly favored by Alexander VIII., Clement XI., and Innocent XIII. He spent 8 years in drawing a meridian from sea to sea in Italy. He left many valuable works.

BIARD, AUGUSTE FRANÇOIS, a French painter, born at Lyons, in 1800, first destined for the pulpit, and for many years of his boyhood attached to the choirs of the Lyons churches, studied in the drawing schools of his native city. In 1827 he was appointed professor of drawing on board a French corvette, which afforded him opportunities to visit Greece and Syria, and gave him so much taste for traveling, that he tendered his resignation in 1828, and went on an artistic exploring tour over Europe, Africa, Russia, Norway, Lapland, Finland, Spitzbergen, and Greenland. Spain suggested his pictures of *Une auberge Espagnole*, and *Une attaque de voleurs Espagnols dans la Sierra Morena*; Aboukir, *Des femmes près d'une citerne*, in the vicinity of that city; Arabia, *Le vent du désert*, and *Un santon au milieu des Bédouins*, and *Une caravane près d'une mare d'eau*, and *Le désert*; Egypt, *Un concert de Fellahs aux environs d'Alexandrie*; Africa, *La traite des nègres*; Hindostan, *La veuve d'un Brahmine allant au bûcher*; Lapland, *Le duc d'Orléans recevant l'hospitalité dans une tente de Lapons*; Spitzbergen, an *Aureola Borealis*, &c. In 1832, his *Famille de mendiants* received a gold medal at the Paris exhibition, and was purchased by the government for 2,000 francs. In 1833, his reputation was increased by the exhibition of his picture of the Arabian overtaken by the simoom in the desert. His most remarkable production at the exhibition of 1839 was the combat with the polar bears; and in the exhibition of 1841, especial admiration was excited by his "Norwegian Minister teaching the Laps," which is considered one of his most successful efforts. Some of his pictures, as, for instance, the "Slave Trade," are marked by a terrible sense of reality, which produces a powerful impression, especially upon the masses of people.

Numerous as his achievements are in this branch of art, his popularity in France is due rather to his burlesque pictures of French characteristics and incidents.

BIARRITZ, a maritime village of France, department of Basses-Pyrénées, pop. 2,410, 5 miles S. of Bayonne, with curious grottoes, a favorite annual resort of bathers, who come from all parts of Europe, and especially of the Basque mountaineers, who deem it an obligation to drink of the mineral waters once a year, as well as to bathe in the sea at Biarritz. Since 1856, the place has had additional importance from being the summer residence of Napoleon III. and his court. Among the most important edifices in Biarritz is the new church, built in 1855. The villa Eugénie, as the imperial residence is called, is an insignificant building, but convenient for bathing purposes. It occupies a low, barren spot, so close to the sea, that when the wind is high, the spray dashes against the windows.

BIAS. I. Son of Amythaon, and brother of the seer Melampus, wooed Pero, the daughter of Neleus; but her father declared that no one should have her save the man who brought him the oxen of Iphiclus. Bias obtained the oxen by the craft and courage of Melampus, and thus won the hand of the princess Pero. The daughters of Prætus, king of Argos, and other Argive women being afflicted with madness, Melampus undertook to cure them, on condition that Prætus should surrender a third of his kingdom to Bias. The condition, however unpalatable, was acceded to, and the brother of Melampus became an Argive potentate. II. BIAS OF PRIENÆ, flourished about the middle of the 6th century B. C. He was not only numbered among the 7 wise men, but was one of the immortal 4 to whom the term "Sophi" was universally applied. He was by profession an advocate. His abilities and eloquence, however, were only at the service of those who had right and justice on their side. He died amidst his fellow-citizens, at a very advanced age, after defending triumphantly the cause of a client, and while the officers of the court were collecting the votes of the diocasts, whose province it was to pronounce sentence.

BIBB. I. A central county of Georgia, with an area of 250 sq. miles, and traversed by the Ocmulgee river, and several small creeks. The surface is uneven. The soil in the valley of the Ocmulgee is fertile, but in other places is unproductive. In 1850, this county produced 3,394 bales of cotton, 225,275 bushels of corn, 30,812 of oats, and 80,240 of sweet potatoes. There were a number of factories within its boundaries, 15 churches, 5 newspaper offices, and 653 pupils attending schools. Value of real estate in 1856, \$1,059,888. Pop. 12,331, of whom 6,004 were slaves. Named in honor of Dr. William Wyatt Bibb, a former member of congress from Georgia. Capital, Macon. II. A central county of Alabama, with an area of 1,080 sq. miles, comprising a hilly and pro-

ductive tract of country, watered by the Cahawba and Little Cahawba rivers, which unite within its limits. It is rich in iron ore and coal. In 1850, it produced 4,648 bales of cotton, 348,455 bushels of corn, and 80,547 of sweet potatoes. There were several mills and factories in operation, 33 churches, and 400 pupils in the public schools. Pop. 9,969, of whom 2,861 were slaves. Capital, Centreville.

**BIBBIENA**, **Ferdinando Galli da**, an Italian architect and painter, born in Bologna in 1657, died in 1743. He was called Bibbiena from the name of the village in which his father was born. His designs were of the most sumptuous character, and procured him employment for many years with the duke of Parma and the emperor Charles VI. of Germany, for whom he painted decorations and architectural pieces, arranged public festivals, and conducted triumphal processions which were famous over all Europe. To him the stage is indebted for the invention and decoration of movable scenery. In 1725 he published a work on civil architecture. His father, Giovanni Maria, his brother, Francesco, and his son, Antonio, were all distinguished for the same tastes, and a considerable degree of the same facility and invention.

**BIBERACH**, a town of Württemberg, is situated on the Riss, 29 miles S. S. W. of Ulm, pop. 4,600. It contains 4 churches, a hospital, a college, and other institutions, with manufactories of linen, woollen, and paper, beside breweries and tanneries. Biberach was the birthplace of Wieland, and near the town are the mineral waters of Jordansbad.

**BIBLE** (Gr. *βιβλος*, a book), a name applied to the collection of sacred writings in the Old and New Testaments. The Greek word, *βιβλος*, applied equally to every book, primarily denoted the reed papyrus, which, among other uses, was prepared in leaves or sheets for writing. The Bible, then, is, by way of eminence, the book, the book of books, or the best book. This name was given to the collection of writings held sacred by the Jews and Christians, in the 5th century by Chrysostom, previous to which time it had been called by various titles, the "Scripture," the "Sacred Scripture," the "Divine Scripture," and each separate portion of the collection had its own name. The book lies before us in 2 general divisions, the Old Testament and the New; the word testament, which means covenant or bond, being used in both portions of the Bible to signify the terms of compact, or the conditions of communion, between man and God. The Old Testament, called the "Law," the "Law and the Prophets," the "Law, the Prophets, and the Psalms," the "Law, the Prophets, and the other Books," also, the "Scriptures," the "Holy Scriptures," the "Old Covenant," the "Books of the Old Covenant," was divided by the Jews into 3 parts, viz., the law, the prophets, and the sacred writings. The law comprised the 5 books of Moses; the prophets comprised the earlier prophets, so called—the books of Joshua, Jud-

es, Samuel and Kings—and the later prophets, 8 major, Isaiah, Jeremiah, and Ezekiel, and 12 minor, as enumerated in our present collection. Under the writings were included the "Five Books," Canticles, Ecclesiastes, Ruth, Lamentations, and Esther, with the poetical books, Job, Proverbs, and Psalms. In this latter collection were counted, beside, the books of Ezra, Nehemiah, Chronicles, and Daniel. The number of the books varied with their grouping. In our English Bibles we count 39. Josephus arranges them so as to equal in number the letters of the Hebrew alphabet, which was 22: according to his classification, Judges and Ruth make one book; the 2 books of Samuel, 2 of Kings, and 2 of Chronicles make 8 in all; Ezra and Nehemiah are 1, Jeremiah and Lamentations 1, and the 12 minor prophets 1. By another arrangement they counted 24; by yet another, 27. There was a difference, also, in regard to the order in which the books should be placed. The Jews were not agreed on this point among themselves. The Alexandrian translators varied again from the Jews. The order existing in our Hebrew Bibles is very ancient, and seems to have been adopted by the Greek Jews, not according to the chronological succession of the several writings, for books of widely different dates are placed side by side, but with a view to grouping the similar classes of composition together, the historical being placed first, the prophetic next, and the poetical last. The writings in the first division contain a history of the theocracy, or of the dealings of God with the people of Israel, and his rule over them, embracing a period of 3,500 years—a history in some parts fragmentary, but, on the whole, wonderfully continuous and complete when viewed as the work of many different hands, in widely distant epochs. This collection opens with the book of Genesis, which, beginning with the creation of all things, takes up the affairs of Israel as the matter of central interest on the earth, gives a family history of Abraham and his descendants, and tells how the people of God were separated from other nations and prosperously established in Egypt. The 2d book, Exodus, describes the deliverance from Egyptian bondage, the passage through the desert, and the covenant on Sinai, with the main features of the legislation. Leviticus continues the legislation, giving the laws which relate to the priesthood, the festivals, and the sacred ordinances. The 4th book, Numbers, contains a supplement to the divine laws, and narrates the weary march through the wilderness, and the opening of the contest for the possession of the promised land. In Deuteronomy, Moses, approaching the close of his career, reminds the people of their past experiences, recapitulates and amplifies the laws already given, exhorts them to obedience, appoints a successor, takes his first and final look at the promised land, and dies. Thus end the 5 books which recount the deeds of Moses. The book of Joshua continues the narrative, describes the conquest of

Canaan, the partition of it among the tribes, the leader's farewell exhortation to the people, and death. In the next book, Judges, we read of anarchy and apostasy, which followed the death of Joshua, the consequent defeat and subjugation of the Jews by the Philistines, and the exploits of heroes who were raised up for their deliverance. The books, or book, of Samuel contain the history of his administration as prophet and judge, the story of Saul's government as king, and the narrative of David's youth, advancement, and reign, till toward its close. The last passage of his reign we read about in the opening chapters of the book of Kings, which covers also the brilliant period of Solomon's rule, and the dark ages that succeeded, the revolt of the 10 tribes, the establishment of 2 hostile kingdoms, the overthrow of Israel, the continuance and the fall of Judah, and the fate of that portion of the nation which remained in the land. In this book we have also particular notice of the prophets who flourished in Israel and maintained the law of Jehovah, in conflict with wicked kings. The Chronicles are called in the Alexandrine version *Paralipomena*, things left over, or supplements, and seem to be composed of materials partly new and partly taken from the elder writings. These are accompanied by the book of Ruth, an episode in the long history, narrating with exquisite grace the circumstances attending the marriage of Boaz, David's great-grandfather, to Ruth, the beautiful Moabitess. And then, in Ezra and Nehemiah, books which the Hebrew and Greek Jews regarded as one, we take up the fortunes of the chosen people after their exile is ended, read the story of the restoration, and the temple-building, and the changes effected by Ezra, the "scribe;" read, also, of Nehemiah's return, the fortification, re-peopleing, and consecration of the city, and the various reforms introduced by him. Thus the history is brought down to about 404 B. C. The book of Esther attempts to supply a gap by recording events supposed to have occurred in Persia during the captivity. But the historical writings, strictly speaking, close with Nehemiah.—While the historical books present the past fortunes of the Hebrew people, and trace the development of the religious ideas which lay at the foundation of their national life, the prophetic books show us the same ideas actually at work with the fears and the hopes of living men, show them as inspiring the friends of the old religion in their conflicts with unbelief and apostasy, and animating the nation with bright hopes of the future. In all literature there are no books like these, so severe in moral, so lofty in religious tone, so sublime in conception, so grand in expression, so rich in poetical imagery. They contain the utterances and writings of the prophets, given in different seasons of need, when internal faithlessness or external danger called urgently for the delivery of Jehovah's message. Covering a great extent of time, they are, of course, various in style and date, and they exhibit to us, not

only the struggles of the popular heart, but the foreign relations of the nation, in a way not attempted by the historical books.—The poetical books express the same ideas with the prophetic, partly in didactic and partly in lyric form. The didactic portion of them consists of 8 books, viz.: Proverbs, a collection of sententious maxims and wise discourses, recommending a good life; Ecclesiastes, an eloquent wail over the transiency of earthly things; and Job, a philosophical poem upon Providence, wonderfully rich in thought and diction, and pervaded by the Hebrew doctrine of resignation to the will of the mysterious Jehovah. The book of Psalms comprises the devotional lyrics of David and other bards. Lamentations is a collection of elegiac verses of a patriotic strain, resembling much the psalms of complaint. The only specimen of Hebrew amatory poetry of an idyllic cast is the Song of Solomon, which has been explained by many scholars, and perhaps was read by the Jews, as an allegory.—The New Testament supplies us with the only existing account of the origin and early spread of Christianity, and is composed of 27 books. Four contain the personal memoirs of Jesus; one (Acts) relates the actions and experiences of the apostles, especially of Peter and Paul; twenty-one are apostolical letters addressed to the several churches, 14 of which are ascribed to Paul, 2 to Peter, 3 to John, 1 to James, and 1 to Jude; and the collection closes with the Apocalypse. An ancient division of the New Testament books was into 2 portions, the Gospels and the Apostle, to which last were added the Acts and the Apocalypse. In the earliest period the 1st of Peter and the 1st of John were united in the same collection with the epistles of Paul; but subsequently the epistles were divided into the Pauline and the Catholic. A later classification makes 3 divisions: 1, the historical; 2, the doctrinal; 3, the prophetic. Of the historical books, two, the Gospels of Matthew and of John, are held to be the works of Christ's immediate disciples, and two, Mark and Luke, of disciples of his apostles. The 5th is ascribed to Luke. It is unnecessary to specify the contents of these writings. The epistles are letters called forth by the peculiar exigencies of the time, and while containing incidentally historical information of value, throw light upon the way in which the Gospel was commended to the Gentile world, and exhibit the developments of Christian doctrine in the apostolic and post-apostolic age. The Apocalypse is the only book of a strictly prophetic character in the New Testament. It holds substantially the same place there that the writings of Isaiah and Ezekiel hold in the Old Testament, differing from those chiefly in the symbolical and allegorical form of representation. It was written shortly after the death of the emperor Nero, and was designed to strengthen the heart of Christians against a threatening persecution, by the inspiring hope of the speedily approaching king-

dom of Christ.—For a period of not less than 1,000 years, learned men have been engaged in selecting, authenticating, and arranging in one volume the constituent portions of the Bible. The history of this undertaking, which is the history of the canon of the Old and New Testaments, will be found in its appropriate place. But the labor that has been spent upon this department of study, is as nothing compared with that which has been bestowed upon the correction and establishment of the Scripture text. The Hebrew text of the Old Testament, as we have it, presents these ancient writings after having been passed through many hands, and subjected to many revisions. Of the primitive text, in fact, of its condition previous to the formation of the canon, 175 B. C., there exists little information of a positive kind. The books, when first committed to writing, whenever that may have been, were probably inscribed on skins or linen cloth, later on the papyrus, and were preserved in the form of rolls. The letter used was the old Hebrew character, as it is called, the same as that found upon the coins of the Maccabees, and was probably of Phœnician origin. The numerous instances of words wrongly divided from each other, furnish one reason among others for believing that they were generally run together in a continuous line; though to this there seem to have been exceptions. There were no vowel points nor accents; the words were composed of consonants, the vowel sounds being supplied by the usage of the living speech. It was not until the time of Ezra, after the Babylonish exile, that the books of the law were subjected to a careful and critical examination. From this time to the close of the 5th century, great changes took place in the sacred text. The written character of the ancient Hebrew language was modified by the Aramaic chirography, until it took the square form, more nearly resembling the Palmyrene letters, which was adopted perhaps on account of its beauty. Simultaneously with this alteration in the written text, came another arrangement of it, with a view to its public reading, though this, too, became finally established only in the course of generations. Tradition, it is supposed, had in a general way prescribed the manner in which the reader's voice should emphasize words and balance sentences, but it was long before that mode was declared by any signs upon the MSS. The first step toward this was the separation of words from each other, and it was taken early in the Christian era. It was followed by the division into verses, which was suggested by the sense of the writing, and was marked in poetry very early by lines or blank spaces measuring the rhythm. In prose it was introduced later for the convenience of the synagogue, and was established by the close of the period we are considering. Before the distribution into sentences was completed, the necessity was felt of breaking up the text into sections of less or

greater length. The paragraphs, or "parashas," as they were called, were indicated upon the page by blank spaces, and were of 2 kinds, the open and the shut. All the books of the canon were then portioned off into sections. The book of the law consisted of 669 parashas, and these, in the absence of headings and running indices, were known and referred to by the subject that was most prominent in each; for example, parash "Balaam," parash "Bush," or "Deluge." For the careful reproduction of the text thus written and distributed, strict provisions were made. Nothing must be added, nothing taken away, nothing changed; letters, words, verses, sections were counted. Rules were made respecting calligraphy; special directions were given in regard to the way in which the MSS. were to be written; every letter that was larger or smaller, suspended or inverted, or otherwise unusual in its form, even if accidentally so written, was to be heedfully copied according to Talmudic law.—The next period in the history of the Old Testament text is the Masoretic, and is commonly reckoned from the 6th to the 11th century. It had become necessary to complete the studies of older scholars, and to perpetuate the traditions which then existed orally respecting the sacred writings. The living knowledge of the Hebrew speech was dying out, the number of learned men was decreasing. Who the scholars were that undertook the labor of the Masora, and what was the course of their labor, we cannot know. They were probably Jews of Palestine, and belonged to the academy which flourished at Tiberias after the time of Christ. The word Masora means a "collection of traditions," and the main object of the laborers in this field was to gather up and arrange the critical material of an older time. But the Masorites did more than this; they aimed at completing what had been commenced before; they would fix the reading of the text in all its parts, and their scrupulous care did much to finish and perfect it, particularly in regard to its grammatical construction. They collated MSS., noticed critical and orthographical difficulties, and ventured upon conjectures of their own. The notes they made were at first written in separate books, and jotted down without any attempt at order or arrangement; afterward for convenience sake they were copied as well as they could be, upon the margin of MSS., or even at the end of a book, a practice that led gradually to vast confusion. Attempts were even made to crowd the whole Masora upon the margin of MSS., and when the space was too small, as often it was, the annotations were appended to the text or omitted entirely. Since the completion of the Masoretic period, that is, from the 11th century, the labors of scholars have been spent in elucidating and perpetuating the Masoretic text. The MSS. had been divided into 2 classes, the sacred and the vulgar. The former contained the Pentateuch, and were very care-

fully revised. The others, in various forms, some written upon common paper in the shape of books, contained more or less of the Masora, and passed through several hands. They were all more modern than the first class. None of these date back as far as the Masoretic period: 4 or 5 belong to the 13th century; some 50 belong to the 18th, and for the following centuries the number increases. The oldest are the best. As these private copies were not so carefully guarded as the rolls of the synagogue, mistakes more easily crept in. Many of the most eminent Jewish scholars of the middle ages devoted themselves to the task of purifying the sacred text by the largest possible collation of MSS.; and in their writings mention is made of famous copies now lost of whose use they enjoyed the benefit. The work of Meyer Halevi of Toledo, in which he endeavored to restore a correct reading of the Pentateuch, was celebrated in the 18th century. When the invention of printing had made easy the exact reproduction and extensive multiplication of copies, an attempt was made to compare carefully the best MSS. extant, to collate with them the Masora, and thus to bring out a true and pure Masoretic text; an undertaking too large to be accomplished at once, and, therefore, but imperfectly executed at that time. The books were produced singly. The earliest printed portion of the Bible, the Psalter, was done in 1477, in small folio form, very carelessly, with many abbreviations, and not a few grave omissions. Later, about 1490, it was reprinted in 12mo, without date or place, and again in the same form with an index. The whole Pentateuch, with the points, the Chaldee paraphrase, and Jarchi's commentary, was printed in 1492, in folio, at Bologna. In 1486 appeared in 2 folios, at Soncino, the Prophets, early and later, with Kimchi's commentary. The entire Hebrew Bible was first printed at Soncino, in 1488. It was made partly from MSS., neither very old, probably, nor very good, and partly from editions of separate books already published. It was of unequal merit. This edition was strictly followed by the Gerson edition printed at Brescia, in 1494, from which Luther made his translation. It was the parent of the first rabbinical Bible of Bomberg, 1517 and 1518, and of Bomberg's manual editions from 1518 to 1521—of the editions of Robert Stephens, 4to, 1589 to 1544, and of Sebastian Munster's, printed at Basel, in 2 vols. 4to, 1536. The next independent edition prepared from a fresh comparison of MSS. was the famous Complutensian Polyglot (1522), the work of Cardinal Ximenes, assisted by the most eminent biblical scholars in Spain. No expense was spared to procure Hebrew MSS. from different countries. The Vatican and other libraries lent their treasures; and 14 years of preparatory labors were spent before the 1st volume, numbered as the 5th in the collection, was issued. The whole comprises 6 volumes: the first 4 contain the Old Testament in Hebrew, Latin, and Greek, with a Chaldee paraphrase, a

Latin version of which is given at the bottom of the page. The 5th volume contains the New Testament, with the Latin Vulgate. The 6th is occupied with indices, vocabularies, and other aids to interpretation. The text of the Complutensian Bible agrees closely with that of Bomberg's first edition of 1518. The third great original edition is the second of Bomberg's rabbinical Bible, printed in folio at Venice, 1525-'6. This embodies the labors of Rabbi Jacob ben Ohajim, who revised the Masora word by word, arranged it, made an index, and availed himself systematically of its whole apparatus. It was reprinted several times in the 16th and 17th centuries. After these 8 independent editions, all that follow contain a mixed text. The Antwerp Polyglot, published 1569-1572, at the expense of King Philip II. of Spain, and therefore called the royal Polyglot, was composed from the Complutensian and Bomberg's just mentioned. Beside the texts in 5 volumes, 4 containing the Old and 1 the New Testament, 3 other volumes gave a valuable apparatus, critical, philological, and antiquarian. The various editions of Plantin followed the Antwerp Polyglot, as did those of Christ. Reineccius. It was the basis also of the Paris Polyglot (10 vols. folio, 1645), which gave the text in Hebrew, Samaritan, Chaldee, Syriac, Arabic, Greek, and Latin, containing for the first time in print the Samaritan Pentateuch. It was repeated again in the London Polyglot (6 vols. folio, 1657). Elias Hutter, in his first edition published at Hamburg in 1587, and 8 times reprinted, used the copies of Venice, Antwerp, and Paris. In 1611 the manual edition of Buxtorf was printed. Buxtorf undertook to improve upon Bomberg's Bible, and, as far as he could, conformed to the Masora, for whose text he had the highest respect, regarding it as the only perfect and inspired. The next important edition for which the oldest and best MSS. were collated was that of Joseph Athias, printed at Amsterdam, 1661 and 1667. Among the later editions that have followed this, the most noted from its new collation of MSS., careful selection of readings, and thorough correction of points, are those of Jablonski, Berlin, 1699; Van der Hooght, Amsterdam, 1705; of J. H. Michaelis, Halle, 1720; Houbigant, Paris, 1758; Simon, Halle, 1752, 1767; Kennicott, Oxford, 1776, 1780; Aug. Hahn, 1822, and G. Theile, 1849. Beside these editions which aim at bringing the Masoretic text near its perfection, critical helps are found in the Masora contained in the rabbinical Bibles of Bomberg and Buxtorf, and the various readings which are found in all the best editions. The toil and treasure expended upon this long series of editions, each of which was a triumph in its time, have not been wasted. The result on the whole is a text of these ancient and venerable books, not indeed perfect in every point and particle, but more excellent than might have been expected, a text that nearly corresponds with that of the books which Ezra collected and which constituted the oldest Hebrew canon.—The task

of purifying the Greek of the New Testament and bringing it to the perfection in which it is presented to us in our latest and best editions, was much less difficult than that of recovering the true text of the Old Testament. Still it was a work of no small magnitude. Not a fragment of writing from the hand of an evangelist or an apostle survived the early generations that used the original MSS. and wore them out. The primitive Christians, though setting a high value upon these productions, did not feel the importance of laying them sacredly aside. The greater their value, the more extensive their circulation, the briefer consequently their existence. The books of the New Testament were written after the custom of the time upon papyrus (2 John, 12th verse), or upon parchment, finer and more durable, which was beginning to take the place of papyrus (2 Tim. iv. 13), and were in the roll form. The writing itself, done with a reed and ink, was in uncial or large letters, and ran in continuous lines. There were no spaces between the words, there were no capitals or stops, and very few sentences; iota subscript, accents, and breathings were all omitted. The heading of the books, "according to Matthew," "according to Luke," &c., was added later, probably not before the whole collection of gospels was made. The epistles may have had their address marked upon them, though it was perhaps inferred from the opening chapters. The title "catholic" was bestowed on an epistle by the end of the 2d century. The earliest copies of these books were sought by individuals for private use. Hence it might easily happen that as copies multiplied they would vary more or less from the originals and from each other, through the carelessness, the mistakes, or the stupidity of many writers, who confounded letters, omitted and repeated words, or falsely divided them. Doctrinal prejudices had likewise some effect in corrupting the text during this uncritical and irresponsible period, but yet more injury was done by the caprices of calligraphists who took liberties with the spelling or the adornment of the MSS. Here and there they undertook to insert historical and geographical amendments; or again, in their anxiety to make the several books harmonize, they ventured upon interpolations or corrections which were by no means calculated to preserve the integrity of the writing. We must add to all this the glosses that were inserted in the text, and the marginal notes made by some learned scribe, and afterward by some dull transcriber introduced into the body of the MS. The number of the copyists was great. Ignorant men undertook the work because there was much of it to be done; and learned men undertook it to prevent its being done badly, but the amendments of the latter were sometimes as injudicious as the blunders of the former. The most famous copyists, the calligraphists of Alexandria, were not well acquainted with Greek or Latin, and no care, skill, or beauty of execution, could make amends for that de-

fect. A custom grew up very early of submitting every copy to an authorized revision, but it offered only a partial check to these corrupting causes. In the 4th and 5th centuries, the writings of the New Testament seemed to be arranged in groups according to certain literary or geographical affinities. They were divided into the eastern and the western, or, according to another description, into an Alexandrine and a Latin, an Asiatic and a Byzantine text. The Alexandrine type of the Greek text was in use among the oriental Jewish Christians who used the Greek version of the Old Testament. The Latin type was common, not only in the Latin copies but in the Greek copies which the Latins used. These groups were not wholly distinct from one another, and it is difficult to fix upon the peculiar reading that belongs to each. The MSS. of the Byzantine class present the most uniformity. Toward the close of the 4th century no single MS. was known that comprised the whole New Testament. At a considerably later period they were rare, and most of these contained also the Old Testament in Greek. The 4 Gospels were commonly written in one collection, and the Pauline epistles in one. The catholic epistles were classed with the Acts, though sometimes these 2 last collections and the Pauline were united. MSS. of the Apocalypse were the rarest. The Gospels were generally found in the succession in which we have them, though in some copies they were transposed. After the Acts usually came the catholic epistles. The order in which the letters of Paul stood varied much. The place of the Apocalypse was fixed by Athanasius at the end of the collection, as it stands at present. By the 4th century the papyrus had given place to parchment, and the form of the roll to that of the book. Breaks in the line and simple points were used. To meet the convenience of the public lecture, the books were measured off into pauses and sentences by lines, after the same manner with the poetical books of the Old Testament. It was not long, however, before other divisions of the text were adopted. In the 3d century Ammonius in making his harmony of the Gospels had broken up the text into hundreds of sections, and after the 5th century his arrangement was indicated upon the margin of nearly all the MSS. The Gospels were portioned out into chapters from a very early period, but the arrangement of chapters which prevailed most extensively, by reason of its being afterward printed, originated in the 13th century with Cardinal Hugo, who devised it while making a Latin concordance. Erasmus noted it in the margin of his Latin translation. It was repeated in the Complutensian Polyglot. Later still was the subdivision of the chapters into verses. The italic letter was not generally substituted for the uncial until the 10th century.—We have 41 collections of New Testament books in MS. from the 4th to the 10th century, their age being ascertained with con-

siderable certainty by the paleographers. To the 4th century belongs 1: the Vatican MS. (B), containing, with the Old Testament text, the whole of the New Testament, except the Apocalypse, the epistles to Timothy, Titus, and Philemon, and the last 4 chapters and half of Hebrews. To the 5th century belong 4: the Alexandrine (A), presented by the patriarch of Constantinople, in 1628, to Charles I., and preserved in the British museum; it is somewhat mutilated by the omission of nearly all Matthew, and portions of John, and 2 Corinthians; the codex Ephraim (O), known also as the Parisian palimpsest, almost unintelligible; 28 leaves of an Armenian palimpsest; and some fragments of the Gospel of John, now in the college of the Propaganda at Rome. To the 6th century belong 9: the codex Bezae (D), containing the Gospels and Acts almost entire in Greek and Latin; 2 palimpsest fragments of the 4 Gospels; 3 fragments of an ornamented parchment, part of which is at Vienna, part in London, and part in the Vatican; a palimpsest in Trinity College, Dublin; a codex of Paul's epistles in Greek and Latin, the Latin representing the oldest form of the translation undertaken in the 2d century, formerly in possession of Beza, now in the royal library at Paris; a MS. of the Acts, the gift of Laud, archbishop of Canterbury, to the Bodleian library, containing the Greek and Latin text of the book almost in perfection; the Coislin codex in the royal library of Paris, 14 leaves from a MS. brought from Mount Athos, containing fragments of 5 epistles of Paul; and a palimpsest comprising portions of the Gospel of Luke, brought from a Coptic cloister to the British museum. From the 7th century, we have but 2: one of them containing passages from the Gospels, the Acts, and Paul's epistles; and one known as the codex Tischendorf I., in the university library at Leipzig, 4 leaves with fragments of the Gospel of Matthew. From the 8th century, 7 MSS. have come down to us: 2 leaves with a portion of Luke; a palimpsest whose 14 leaves contain part of Mark; fragments of the Gospel of John in the Barberini library at Rome; a MS. with Luke and John complete, and scholia, partly critical, upon the margin, brought by Tischendorf from the East; the Basel codex, with a text of the 4 Gospels nearly complete; a MS. of the Gospels almost perfect in the royal library at Paris, the text resembling closely that of the Vatican MS.; and a copy of the Apocalypse, the Basilean codex, now in the Vatican. The 9th century gives us 18 MSS.: a complete one of the 4 Gospels presented by the Abbé des Camps to Louis XIV.; 8 leaves with some verses of the Gospel of John from Mount Athos; a MS. in the university library at Munich, with numerous fragments of the Gospels and a patristic commentary; a MS. of Gospels as far as John vii. 89 at Moscow; a fragment of Gospels, with Luke entire, and portions of the rest; a MS. of Gospels with Latin versions interlined, which corresponds with the Vulgate

rather than with the Greek; the codex Boreell in the university library at Utrecht, containing 4 Gospels with many omissions; the codex Cyprianus, brought from Cyprus to Paris, 1673, comprises the unmutated Gospels; the codex Augiensis, bought in Switzerland by Richard Bentley, and presented by Thomas Bentley to Trinity college, Cambridge, contains Paul's epistles nearly entire in Greek and old vulgate Latin, and the epistle to the Hebrews in Latin; a MS. of Paul's epistles in Greek and Latin; a codex of Acts at Modena, 7 chapters wanting; a MS. of the catholic epistles and those of Paul, at Moscow; a MS. containing the Acts, the catholic epistles, and Paul's, slightly mutilated, in a library of the Carthusian monks at Rome. From the 10th century we have 5: a perfect copy of the Gospels in the Vatican library; a MS. in the library of St. Mark's, at Venice, with the text of 4 Gospels complete; a codex of the Gospels in the British museum, brought from the East, defective; another in the city library at Hamburg; a copy of the Olermont codex (Beza's), now in St. Petersburg, in Greek and Latin, of small value. Of all these MSS., only 8 embrace the whole New Testament, and neither of these without considerable deficiencies. Of the rest, 27 contain the Gospels alone, 9 have small fragments of them, 10 have large fragments, and only 8 embrace the text wholly or nearly perfect. The book of Acts exists in full in but 8 codices. The catholic epistles are found in 5. The epistles of Paul are comprised more or less completely in 12, 9 of which give them almost entire.—Space does not allow us to dwell upon the labors of Christian scholars of the earlier centuries, to establish the text of the New Testament. We can do no more than mention the names of Irenaeus, Clement, and Origen, of Athanasius, Eusebius, Epiphanius, the Cyrils, Chrysostom, and Theodoret, among the Greeks; of Cyprian, Tertullian, Ambrose, Augustine, and Rufinus among the Latins; of Bede, who worked at the Acts of the Apostles; of Alcuin, who endeavored to purify the Latin text; of Photius in the 9th century; Suidas in the 10th; of Theophylact, Acumenius, and others, in subsequent ages. The fruit of their labors was not abundant. Fifty years elapsed after the invention of printing before an attempt was made to publish, by means of it, the original text of the New Testament. The 5th volume of the Complutensian Polyglot contained the Greek and Latin of the Christian Scriptures, based on MSS. of no very eminent worth, so far as may be judged. The volume was printed first of the whole set in 1514, but was reserved until the rest were finished in 1522. Before this, in 1516, Erasmus had issued the first Greek and Latin edition of the New Testament at Basel, constructing his text from 5 MSS. there, one of which contained the Apocalypse. A second edition, changed in some hundred passages, appeared in 1519; a third in 1522, in which he for the first time in-

serted the text 1 John v. 7, from the codex Montfort. A fourth edition (1527) was altered further, especially in the Apocalypse, according to the Complutensian, and in 1535 was repeated without much change. These two arrangements of the text were frequently reproduced. That of Erasmus, in particular, was reprinted 6 times in different cities. Famous at this time were the editions of Robert Stephens, a learned printer of Paris. One of these, printed at Geneva, 1551, presented for the first time the Greek text divided into verses. Theodore Beza's numerous editions, great and small, 1565 and onward, sprung from Stephens's, and after Beza's again were made those of the Leyden booksellers, the Elzevirs, of which the first 2 appeared in 1624 and 1633, and gave what has since been called "the received text." The Elzevir text, borrowed from Stephens' third edition of 1550, which in turn rested upon the fifth edition of Erasmus, had been in authority 100 years, when 3 editions appeared, distinguished by a more thorough collation of MSS. and versions, and by learned dissertations, historical and critical. The first of these was Brian Walton's, contained in the 5th volume of his Polyglot Bible, 1657. It presented the New Testament in Greek, Latin, Syriac, Arabic, and Ethiopic; a 6th volume contained the learned apparatus. The 2d was that of John Fell, published at Oxford, 1675. The 3d and most famous was that of John Mill, printed at Oxford, 1707. An improved edition was issued at Amsterdam, 1710, by Ludwig Kuster. But much more thorough and rich than any of these was the edition of J. J. Wetstein, which was printed at Amsterdam in 2 vols. folio, 1751-'2. The dissertations had been issued anonymously 21 years before. This critical apparatus, derived from old MSS. and versions, from the fathers, from former editions and the notes of scholars, ancient and modern, long remained a treasury for biblical students. Contemporaneously with Wetstein, Joh. Alb. Bengel, a Swabian theologian, attempted to simplify the text by a new arrangement of MSS. and a separation of them into 2 families, the Asiatic and the African. His chief edition appeared in 1784. Semler followed in the track of Bengel, and both prepared the way for Joh. Jac. Griesbach. This ingenious and erudite scholar divided the authorities for settling the text of the Gospels into 3 principal classes, the western, the eastern, and the Byzantine; each representing, with more or less exactness, a standard text of its own. The first of these "recensions" he supposed to be the oldest, dating back in its origin to the time in the 2d century when the 2 collections, the "Gospel" and the "Apostle," were distinct. The eastern group, he supposed, sprung from the union of these 2 collections, and was very ancient. The MSS. which composed the Byzantine group arose in the 4th century, from the mingling of the eastern and western standards. Having thus systematically classified his authorities,

Griesbach laid down a series of rules for the recovery of the genuine text, and upon these, with vast research and critical ability, built his famous editions, the first of which, containing the first 3 Gospels, was published in 1774; the second, the great edition, in 1796 and 1806. The basis of Griesbach's text was the Elzevir *textus receptus*, which, however, he altered much, at the same time placing various readings at the foot of the page. Griesbach's system was vehemently opposed by C. F. Matthai, who examined more than 100 MSS. at Moscow, representing mainly the so-called Byzantine text, and published his results in an edition of the New Testament in 12 volumes, 1782-'88. Eichhorn, on the other hand, sustained Griesbach in his main positions. Eichhorn's theory of the formation of the Gospels, by additions to one original document, which each of the evangelists is supposed to have used and worked over, no longer holds a place in the regard of the best scholars. In 1830-'36, Aug. Scholz, who had travelled much and examined many MSS., published an edition of the New Testament upon the basis of the Byzantine text. This work has been very highly esteemed. To describe the critical labors of Karl Lachmann, whose stereotyped edition of the bare text was followed in 1842 and 1850 by his great Greek and Latin edition, with its array of authorities, would carry us too far. Some have looked upon his work as marking an era in textual criticism, and finally establishing the genuine reading of the New Testament; others, again, have criticized it severely, and pronounced it of little value. Between these judgments it is not our duty to decide. At present, the most conspicuous name in this department of scholarship is that of Dr. Tischendorf, of Leipsic. He published an edition in 1840. In 1842, this was followed by another at Paris. But, meanwhile, the author's views had been maturing; he had conceived a plan of reforming the criticism of the New Testament text; under the patronage of the king of Prussia, he travelled over Europe and in the East, making researches, the results of which appeared in a second critical edition of the New Testament, in 1849. In 1850 he put forth an edition of the text alone, and again, in 1854, a revised edition, with an attempted restoration of the Vulgate.—The ancient translations of the Old Testament have been of great value in preserving and interpreting the genuine Hebrew text, for they were made in some cases from MSS. that dated back far beyond the Masoretic period, and were executed with a very literal exactness. Of these, the oldest and most celebrated is the Greek version called the Septuagint, from the 70 members composing the Jewish sanhedrim, or, perhaps, from the 70 fabled translators, who, as the Jewish legend went, being shut up in separate cells, executed 70 distinct versions, which corresponded with each other word for word. It was commenced by Jews of Alexandria as early as 285 B. C.,

and was finished in the course of years by different hands, as is evident from the language in the several portions, and from the style which characterizes the separate books. The Pentateuch is pronounced by scholars the best portion of the work; other portions are unequal; here and there it is said to betray an imperfect knowledge of the Hebrew language. The Greek Jews, in the declining state of the Hebrew tongue, made great use of the Septuagint, and even the Jews of Palestine held it in high esteem until the Christians in the 2d century quoted it against them. From that time its reputation diminished. In Jerome's day there were 8 differing, yet authorized editions of the Septuagint in use: 1 in Palestine, 1 at Alexandria, and 1 in Constantinople. Hence the corruptions that mar the MSS. in our possession. The Septuagint was the parent of many translations in Latin, Syriac, Ethiopic, Egyptian, Armenian, Georgian, Slavonic, Arabic. Many oriental versions were made from the Hebrew, of uncertain date; among them the Targums, or "admirable versions," in Chaldee, the Samaritan Pentateuch, the Syriac translation called the Peshito, or "true," "simple," one of the oldest translations of the Bible, several in Arabic, and one in Persian. There were also other Greek versions, of which the most celebrated was that of Aquila, made about A. D. 140, and valuable on account of its anxious literalness. Fragments of it are preserved in Origen's Hexapla. But after the LXX. the most famous version from the Hebrew was the Latin version of Jerome, the basis of the present Vulgate. Jerome had previously undertaken a revision of the old Latin translation from the LXX. called the *Itala*, but the text of this ancient version was so much mutilated, and the text of the LXX. itself was so corrupt, that he was led back, or perhaps driven back, by the pressing urgency of his friends, to the original Hebrew, and commenced, A. D. 385, the new version, which he completed in 405. The work, though hastily, was, on the whole, well done. The translator made use of the Greek versions that were before him, as well as of the Arabic and the Syriac, always, however, comparing them with the Hebrew. The translation, having to contend with a superstitious reverence for the LXX., met with a doubtful reception, and made its way slowly into favor, but in the course of 200 or 300 years, it was highly regarded at Rome, and in other places;—not so highly that it escaped corruption from careless copyists, indiscreet revisers, ambitious critics, and reckless theologians. The old Vulgate (the *Itala*) and the new injured each other. Alcuin, early in the 9th century, bidden, and, as some think, aided by Charlemagne, revised and corrected Jerome's version by the Hebrew and Greek originals. Lanfranc, archbishop of Canterbury in the 11th century, revised it again, and "all the church throughout the western world rejoiced that it was illuminated by the light of this

emendation." The council of Trent, which met in 1545, apparently with a view of preventing the confusion that resulted from promiscuous labors upon the Vulgate, took it under the peculiar patronage of the church, and decreed (1546) that the edition "should be printed as accurately as possible." As it had become necessary to prepare an authentic edition of the authorized version, two popes, Pius IV. and V., addressed themselves to this task; learned men were assembled, a printing press was erected in the Vatican, a pontiff looked over the printed sheets, and the work was published in 1590; but it proved to be so imperfect that Gregory XIV. called another assembly of scholars to make another revision. This time the duty was more thoroughly discharged, and the *Biblia Sacra Vulg. Ed. Test. V. Pont. Max. jussu recog.*, &c., the basis of every subsequent edition, was issued in 1592. The famous Belarmin, one of the translators, wrote the preface. Translations of the New Testament were made very early into all the tongues then spoken by Christians, but these are more interesting to the biblical scholar than to the general reader. A few words upon some of the more modern versions will however be in place here.—Portions of the Bible were translated into Saxon by Aldhelm, Egbert, Bede, and others, between the 8th and 10th centuries. The first English version known to be extant, is supposed to have been made in 1290. Wycliffe's literal translation of the Bible from the Vulgate into the popular English speech was finished in 1380, and multiplied by copying. This version has recently been printed in England. The first volume produced by Gutenberg's types, 1450-'55, was the Latin Bible, and it was a prodigious effort for the times. Hardly had the press completed it, when versions began to multiply. In 1523, William Tyndale, "finding no place to do it in all England," went to the continent, and there, at Worms, in 1525, printed his version of the New Testament from the original Greek. Coverdale, his fellow-laborer, finished his translation of the Old Testament in 1535, and this was followed by several editions of "Matthew's Bible," called also the "Great" Bible, or "Cranmer's," according to its editors. This was the authorized version under Edward VI. The "Genevan Bible" was a new and careful revision of Coverdale's, with annotations, and not being perfectly satisfactory to Bishop Parker, he undertook another version by the help of eminent scholars, which was called the "Bishop's Bible," published in 1568, with preface and notes. Its basis was the "Great Bible," and the "Genevan." A little later appeared the Douay Bible, the New Testament in 1582, at Rheims, the Old Testament in 1609-'10, at Douay, upon the basis of the authorized Vulgate. Our present English version was made by direction of James I., who, on motion of Dr. Reynolds, of Oxford, in the conference at Hampton Court, commissioned 54 divines to undertake the labor. Seven of the 54 died before

the task was commenced, but, in 1606, the books were distributed among the remainder in 6 portions, and the translation was diligently pressed. The "Bishop's Bible" was the basis, faithfully compared with the original, and corrected where it was defective. The whole, with chapters and headings, marginal glosses, and parallels, was completed and sent from the press of Robert Barker, in 1611.—In Germany, Martin Luther spent 10 laborious years, from 1522 to 1532, in executing that wonderful translation which has done so much for the Bible and for the language into which it was rendered. Several portions of the Scriptures he had translated into German before, for the use of the people, viz., the penitential and other Psalms, the Lord's prayer, the Ten Commandments, and other passages, which were often printed. It was not till toward the close of 1521 that he conceived the plan of translating the whole; but having commenced, the work proceeded rapidly. The New Testament was finished first; in a year came the Pentateuch; another year completed the historical books and the Hagiographa; two years more brought Jonah and Habakkuk, and the prophets were finished in 1532. It was all Luther's work. As the foundation he used the Brescia edition of 1494 (his copy is still preserved at Berlin), and with this the LXX., the Vulgate, and other Latin versions, while for the New Testament he took the text of Erasmus, 1519. Many versions have been made since Luther's, in Germany, but for vigor, simplicity, and beauty, his has not been surpassed, not even by the noble one of Augusti and De Wette.

**BIBLE SOCIETIES**, societies and associations having for their object the circulation of the Bible in the vernacular of the people, or a language which they understand. So early as 1698, a society for the promotion of Christian knowledge had been organized in Great Britain, out of which several similar organizations had sprung, in different parts of the kingdom, previous to 1792. All these societies embraced the circulation of the Scriptures, as one of their objects. But it is believed that no society had been organized for the exclusive purpose of circulating the Bible without note or comment, previous to the era of the "British and Foreign Bible Society" (1804). But the work which the "Society for the Promotion of Christian Knowledge" had been doing, and perhaps more especially that which it refused to do, when solicited, prepared the way for a new era in Bible distribution. The society for the promotion of Christian knowledge had published an edition of Welsh Bibles. The supply was exhausted, and the destitution great. A missionary named Thomas Charles, who had labored for 20 years in the gospel, travelling through Wales, preaching and organizing Sunday schools, urged the matter of a new supply on the society. After many delays, the society issued an edition of 10,000 in 1796. This exhausted, Charles called for more. The call was disregarded, and he attempted an edition by subscription. This

also failed. Charles then went to London (1802), where he was introduced to the executive committee of the tract society, related to them the destitution of Wales, his desire for a new edition of the Welsh Scriptures, and proposed to organize a society for the purpose. One of the committee, the Rev. Joseph Hughes, a Baptist minister, much affected at Charles's account, replied, "Certainly; and if for Wales, why not for the world?" On this idea the committee acted. Hughes sent out a call for a meeting to take the project into consideration, and Steinkopf, a German preacher, offered to gather information concerning the foreign destitution of the Scriptures, while others were to collect similar data at home, for the purpose of laying it before the meeting. The meeting met pursuant to call, in London tavern, March 7, 1804, about 300 persons of all denominations, even Quakers, who till that time had never acted but in one instance with other Christian sects. Steinkopf made his report. It disclosed an unexpected state of affairs, and many influential persons present were so affected by it, that they immediately lent their coöperation to the work. The society commenced operations with a subscribed fund of £700, appointed a president, vice-president, secretary, treasurer, and an executive committee of 15 church of England laymen, 15 dissenting, and 6 foreigners. The members were to pay a guinea annually, and have a discount on Bibles. The first object was to supply Wales. The society, therefore, at once published an edition of 20,000 Bibles and 5,000 Testaments. So great was the interest of the Welsh population in the matter, that they drew the first load by hand through the city, with great rejoicing. The society soon had auxiliaries, both at home and on the continent. The greater part of these, however, were formed after 1812, in which year the foreign secretary of the home society visited the continent, and travelled through Denmark, Germany, and Switzerland. Nearly 80 such associations, with numerous branches, existed in different parts of the continent previous to 1816, or the era of the American Bible society. Many of these embraced both Protestants and Catholics, and several were instituted by Catholics themselves, though the authorities of the church did not always look with either favor or forbearance on the movement. A society formed in Ratisbon (1805), for translating into German and circulating the Bible, was abolished by a papal bull (1817). Another formed in Presburg, for the circulation of the Scriptures in Hungarian, was similarly dealt with. In many countries, the royal favor and coöperation were extended to the enterprise of the societies, as in Norway and Russia, though the society in Russia was abolished by royal ukase, in 1826, and the same year a Russian Protestant Bible society was formed. Now (1858) there exist 72 Bible societies with numerous auxiliaries, agencies, and branches, and these societies are distributed in almost all parts of the inhabited globe.—In 1816, the

"American Bible Society" was formed. Its first object was to supply the destitution of the Bible in the United States, and then, according to its ability, extend its influence to other countries, whether Christian, Mohammedan, or pagan. Previous to the American Bible society, the Bible society of Philadelphia had been formed (1808), and also one in Connecticut, and one in Massachusetts (1809), also one in Halifax (1818), and one in Antigua (1814). The American Bible society was formed in New York, and its receipts for the first year were \$37,779 85, and its circulation of Bibles and Testaments, 6,410 volumes. After an existence of 42 years, its receipts for the year ending April, 1858, were \$386,960, and its issues reached 712,114 volumes. In 1858-'4, the issues were 815,899 volumes. The total circulation of the Scriptures by the society up to the present year (1858), has been 12,804,083 volumes of the Bible, or parts of the Bible, in all cases without note or comment. In 1852, the society commenced the construction of a new building to accommodate its enlarged operations. The corner-stone was laid on May 11, and in a few days less than one year the new premises were ready for occupancy at a cost of \$308,000. The immense structure occupies an entire square, bounded by Third and Fourth avenues, and Eighth and Ninth streets, and covers nearly  $\frac{1}{2}$  of an acre of surface, is 6 stories high, built of brick, with free-stone copings, and commands attention by its magnitude, proportions, and finish. In 1853 the constitution of the society was amended. In 1847 the managers of the American Bible society found that their Bibles, and those of England, had many small discrepancies which embarrassed the proof-readers. They therefore entered on a thorough collation of the English Scriptures, under direction of their committee on versions. That committee made a report of their doings in 1851. Their collator found but little short of 24,000 minor discrepancies in the text, but no one of which affected the sense. The committee, in addition to the collation of the text, which was thoroughly done, decided also to prepare a new series of chapter-headings. This, in 1857, caused great complaint on the part of many local societies and members, so that in January, 1858, the board felt it their duty to collate the headings of the English Bibles (as well as the text), and remove those which had been made new. The society sells and distributes its books in this country chiefly through its auxiliary societies, of which it has in the states and territories nearly 8,000. Twice in the course of its existence have the energies of the society been directed by special action to the work of supplying the destitute in our own country with the Bible, in 1829 and 1856. In addition to the intention of the society to supply every family with the Bible, where it finds a willingness to receive it, its funds are also expended in the work of translating and circulating the Scriptures in foreign lands. In pursuance of this work, the American Bible

society has aided foreign missionary societies in all parts of the world, with its own issues, and also with funds to enable them to translate and print on missionary ground.—The "American and Foreign Bible Society" was established in 1837, and incorporated by the legislature of New York, April 12, 1848. It was formed by a secession of the Baptists from the American Bible society. The design of the latter society was stated at its organization to be the dissemination of the Scriptures in the received versions where they exist, and in the most faithful translations, where they may be required. The latter clause left it to the discretion of the managers to decide what versions should be deemed worthy of patronage, and in the exercise of this discretion they refused aid to the existing Bengalee and Burmese versions, because the Greek word βαπτίζω was translated in those versions by a word corresponding to the English "immerse." During the year 1856-'57 the American and foreign Bible society put into circulation 93,000 copies of the Scriptures, beside employing 92 Bible readers, or persons who visit families for the purpose of reading to them the Bible, for religious conversation and prayer, who were distributed through this country, Canada, Mexico, Germany, Denmark, Sweden, China, and Greece. The whole amount of receipts for the same year was \$56,649 49.—"The American Bible Union" was organized in New York, June 10, 1850. Its object is "to procure and circulate the most faithful versions of the sacred Scriptures, in all languages throughout the world." Its founders seceded from the American and foreign Bible society May 23, 1850, when that body decided that it was not its province or duty to revise the English Bible, nor to procure a revision of it from others; and that in its future issues it would only circulate the existing commonly received version. The membership is composed of voluntary contributors, \$80 constituting a member, \$100 a director for life. Its contributors for membership in 1858 are about 15,000 persons, found in every portion of the United States, in Canada and Great Britain, and, indeed, wherever the English language is spoken. The field of its operations is the world. It has aided extensively in the preparation or circulation of versions made on its principles, for the Chinese, Karens, Siamese, French, Spanish, Italian, German, and English. It has just completed a revision of the Spanish New Testament, which is said to be superior to any other version in that language. A revision of the Italian New Testament has been published and widely circulated. But the primary aim of the union is to prepare a thorough and faithful revision of the common English version. To accomplish this it has employed the aid of scholars of nine evangelical denominations. Though mainly composed of Baptists, it professes to act without reference to denominational differences. The principle adopted for the guidance of translators is: Express in language most readily understood

by the people "the exact meaning of the inspired original." No views of expediency are allowed to withstand the invariable operation of this rule. The preliminary revision of the entire New Testament is in the course of publication, being sent forth for criticism among all classes of scholars, who are willing to examine it, and suggest any improvement. No expense has been spared in procuring books or supplying every possible aid for the greatest perfection of the work. This preliminary revision is subjected to careful examination and correction, by a learned committee composed of eminent biblical critics. The society publishes a quarterly journal, giving details of its progress, and a monthly with the revised Scriptures, as they may be ready for public examination. Since its origin it has issued of the Sacred Scripture, 287,800 copies, 48,109,600 pages; of quarterlies, tracts, &c., 880,801 copies, 11,689,204 pages. Total copies, 668,601; total pages, 59,748,804. The receipts have now reached the sum of \$45,000 per annum, and are steadily increasing. The library collected for its translators' use numbers more than 4,000 volumes, and comprises some of the rarest works on biblical criticism which can be found in the world.—The "Bible Revision Association" was organized in Memphis, Tenn., April 2, 1853. Its location is in Louisville, Ky. It has a board of 80 managers and executive officers. It occupies the southern and southwestern of the United States. It has a membership of about 3,000 persons, and is rapidly extending its operations, in conjunction with the American Bible union, with which it coöperates in the objects of its organization.—When the British and foreign Bible society was formed, the Bible was printed and circulated in 50 tongues; now it is printed and circulated in 166 versions, and in nearly all of these the British and foreign Bible society aided directly or indirectly, and in many of them the American Bible society had an important share. Ninety-nine new versions have been made, including 14 European languages, 15 Asiatic, 11 Polynesian, 11 African, and 7 American. Many of these were first made written languages by the societies. By the efforts of Bible societies, since 1804, have been circulated about 48 millions of copies of the Bible, either entire or in part.—But the history of Bible societies would be incomplete without mention of the controversy with regard to the Apocrypha, in which they were involved from about 1811, and which was not finally settled until 1827. The one idea of Bible societies, the circulation of the Scriptures without note or comment, had, to a certain extent, engaged all parties indiscriminately, and especially all parties of the reformation. The Catholic church had a different canon of Scripture from the Protestant. On the continent various causes had conspired to separate the Protestants less in this matter from the Catholics than their brethren in Great Britain.. Consequently, on the continent, the Catholic canon was in use

among Protestants. At first, the London society had connived at this difference of sentiment, or at least had not allowed itself to interfere with its free exercise. Thus the German auxiliary societies had from the outset purchased for circulation the Oanstein Bible, in which the apocryphal books were intermingled with the canonical (Protestant). A feeling began to be manifest on this subject, perhaps, first, and certainly with greatest violence, in Scotland. The parent society decided, therefore, to request its auxiliaries to leave out the Apocrypha (1811). This request produced some feeling, and it was rescinded (1818). The apocryphal war was thus fairly commenced; for the passing and subsequent rescinding of the resolution of 1811 brought the parties into position. The inspiration of the apocryphal books was discussed, and the custom of the Protestant church cited, which had translated the Apocrypha, and even in the establishment appointed it "to be read in the churches." While the general sentiment was in favor of the non-inspiration of the apocryphal books, one party insisted on the propriety of their circulation, on the ground that the catalogue of the canon was not inspired, and that even the Protestant canon itself was not an article of faith, but might contain uninspired books. On the other hand, the anti-apocryphal party rigidly defined the difference between the canonical and apocryphal books, designating the apocryphal as "far below the level of many human writings, full of falsehoods, errors, superstitions, and contradictions, and the more dangerous for assuming to be a Divine revelation." The Scotch party was violent, the continental unyielding. The publication of the Catholic Bible in Italian, Spanish, and Portuguese, in 1819, with the coöperation of the society, added fresh fuel to the flames. It was thought by the Edinburgh society a violation of the act of 1818. It was urged that to publish a Bible in which the apocryphal books were made canonical, was worse than merely to publish them as apocryphal at the end of the Old Testament canon. The London society, on a revision of its course, decided it to be erroneous, and resolved, Aug. 19, 1822, that the moneys of the society should henceforth be used only in printing the canonical books, and that if the auxiliaries published the Apocrypha, they should do it at their own expense. When, in accordance with this act, Leander Van Ees asked aid in publishing his Bible, and promised to include the Apocrypha at his own expense, the society appropriated £500 for the purpose (Sept. 24, 1824). The anti-apocryphal party procured the rescinding of the act the following December, on the ground that the apocryphal books were still undistinguished from the canonical, and that, therefore, although the society's money was not used to publish them, they nevertheless had the apparent sanction of inspiration by the good company in which the society allowed

them to be put, by consenting to have them intermingled with the inspired books. The society, in rescinding the above act of appropriation, advanced only one step further in the apocryphal reform. It had, in the act of rescinding, declared that the money of the society might be applied to aid those editions of the Bible in which the apocryphal books were printed at the end of the canon. The anti-apocryphal party had already achieved too many victories to be satisfied with so moderate ground. The Edinburgh society now protested (Jan. 17, 1825) against this compromise of Protestantism, and procured, in the following February, a rescinding act which swept the records of the London society of all former acts on the subject. The matter stood now where it had before 1811, but the anti-apocryphal sentiment was conscious of its strength, and now initiated positive proceedings. A two years' contest followed, in which the ground was all reviewed, and the end of which was a resolution of the London society (May 8, 1827), that no association or individual circulating the apocryphal books should receive aid from the society, that none but bound books should be distributed to the auxiliaries, and that the auxiliaries should circulate them as received, and that all societies printing the apocryphal books should place the amount granted them for Bibles at the disposal of the parent society. Thus ended the controversy, a controversy which threatened for a time to split the parent society itself, and which did result in the secession of many auxiliaries on the continent. Previous to this controversy, the Roman Catholic church had in many instances (especially on the continent) acted with the Protestants. But, as already mentioned, that church had abolished the Bible society of Ratisbon (1817) in the midst of the contest. Meanwhile the London society continued the aid of its funds, under its successive prohibitions in reference to the Apocrypha, to the individual enterprise which still persisted, at Munich, in the circulation of the Bible. Gradually the Roman Catholic church withdrew its favor from an enterprise that refused its aid in the circulation of that which she deemed the canon of Scripture, until, from the coöperation which had characterized the early history of Bible societies, the movement became essentially Protestant. The American Bible society, made up of materials more thoroughly Puritanic and less Lutheran and continental, from the outset, was free from the distractions growing out of this dispute. That society has never published any other than the canonical (Protestant) books; and the only instance in which it has departed (if it be a departure) from the avowed principle of circulating the canonical Scriptures, without note or comment, is in the headings it has given to the chapters. In both the London and American societies the standard English version followed is that of King James.—One thing more remains to be

noticed, and that is the extreme cheapness of the Bible, under the auspices of the American Bible society. A good Bible for family use (the "brevier Bible" of the society) can now be had for 45 cents, while a nonpareil edition costs only 25 cents, and Testaments are as cheap as 6½ cents. This is partly the result of the donations the society receives, but more especially of the immense circulation the Bible has under its action attained.

**BIBLICAL GEOGRAPHY.** In the heart of the eastern continent, embraced by 5 seas, the Mediterranean, the Ægean, the Euxine, the Caspian, and the Persian gulf, lies a section of the globe which has been the arena of most of the events recorded in Scripture. Here the scene opens in Genesis, here the curtain of the flood falls on the first act, and here, in one of the coast-islands of the Ægean, occurs the closing vision of the Apocalypse. On the north, the great Caucasian wall spans the breach between the waters of the Caspian and the Euxine, the desert of salt flanks the eastern border from the Caspian to the Persian gulf, and the arid sands of Arabia complete the enclosure on the south. The territory thus bounded was unequalled in the fertility of its soil, the variety of its products, the facilities of its commerce, and the salubrity of its climate. It was fit to be the cradle of the race. A single mountainous system, the Taurus, cuts centrally across the entire area, dividing it into 2 nearly equal northern and southern portions. This chain, bifurcating in Ararat, sends one of its spurs to the head of the Persian gulf, and unites the other with the great Persian range. Dividing similarly at the head of the Mediterranean, it sends the southern or Libanus spur along the eastern shores of that sea, and distributes the other into those scattered and broken peaks which like sentries flank the semicircular coast of the Anatolian peninsula, until they meet the Caucasus on the north. Thus this whole sea-girt section is one vast water-shed with two culminating points, Ararat in the north and Lebanon in the south. It is well watered by large and numerous rivers, emptying into all these encircling seas, among which are prominent the Euphrates, the Tigris, the Barada, the Orontes, and the Jordan. Add to the territory thus described, a narrow strip on the southern shores of the Mediterranean, and the peninsulas of Italy and the Peloponnesus on the northern, and the area of biblical geography is complete. In this expanse are included Babylonia, Assyria, Mesopotamia, and Chaldea in the east, the extensive regions of Asia Minor and Armenia in the north, Greece and Italy in the west, and the peninsula of Sinai and Egypt in the south, while Palestine glitters in the centre of the whole. The more specific geographical features of these several kingdoms will be found under their appropriate heads. The study of biblical geography has a repulsive feature to the student in the almost universal changes of the names of localities in modern works, and the

consequent inability to identify many places possessing the profoundest interest and importance. Much has lately been done by the researches of travellers in the East, made in the special interest of Bible history. We may here mention with the highest encomium, the "Biblical Researches in Palestine and in the adjacent regions," by that indefatigable scholar, Dr. Robinson of this country; as also an admirable treatise, "Sinai and Palestine," by the Rev. Mr. Stanley, canon of Canterbury, England. Mr. Stanley well remarks in his prefatory advertisement: "Much has been written, and still remains to be written, both on the history and geography of the chosen people. But there have been comparatively few attempts to illustrate the relation in which each stands to the other." The influence of the geography of a country on its history, its poetry, and even its philosophy and religion, is very great, and it is not easy to overrate the value of such works as those above mentioned in illustrating the narrative and teachings of the Bible.

BIBLIOGRAPHY (Gr. *βιβλίον*, a book, and *γραφειν*, to describe), literally signifies the description of books. Among the Greeks the term *βιβλιογραφία* signified only the writing or transcription of books; and a bibliographer with them was a writer of books, in the sense of a copyist. The French term *Bibliographie* was long used to signify only an acquaintance with ancient writings, and with the art of deciphering them. In its modern and more extended sense, bibliography may be defined to be the science or knowledge of books, in regard to the materials of which they are composed, their different degrees of rarity, curiosity, reputed and real value, the subjects discussed by their respective authors, and the rank which they ought to hold in the classification of a library. It is therefore divided into 2 branches, the first of which has reference to the contents of books, and may be called, for want of a better phrase, intellectual bibliography; the second treats of their external character, the history of particular copies, &c., and may be termed material bibliography. The object of the first kind is to acquaint literary men with the most valuable books in every department of study, either by means of *catalogues raisonnés* simply, or by similar or alphabetical catalogues, accompanied by critical remarks. Considered as a distinct science, bibliography has been, and still is, cultivated most extensively in France, Germany, and Italy. This is owing, in a great degree, to the riches of the large public libraries of those countries, which are freely accessible to all, the great number of fine private collections, and the familiarity of their scholars and literary men with books of all ages and nations. To the researches of Barbier and Brunet, Ebert and Ersch, Tiraboschi and Gamba, the history of literature is deeply indebted. Great Britain can indeed boast of its rich public and private collections; but the use of them is limited, and hence the science has, until within comparative-

ly a recent period, received less attention there than upon the continent. The labors of Lowndes, Horne, Dibdin, and Watt, have of late years done much to promote its cultivation. In this country the science has been very naturally neglected. But the general diffusion of knowledge and wealth has led to the formation and rapid increase of public and private libraries; bibliography is therefore receiving increased attention, and the importance of its claims as a practical science is frequently and successfully urged by our leading educational and literary men. It is the fault of many of the votaries of bibliography, especially in France, that they have exaggerated the value of their favorite pursuit far beyond that rank to which it is fairly entitled in the scale of human knowledge; and Peignot, Achard, and others, have represented it as the most extensive, and even universal, of all sciences. Nothing certainly can be more absurd than to view it in this light, merely because it treats of books, and because books are the vehicles of all sorts of knowledge. Yet this is the only foundation that can be discovered for these extravagant representations, which tend, as in all other cases of exaggerated pretension, to bring ridicule upon a subject which cannot be regarded otherwise than highly important, when simply and correctly defined. Conformably to what has now been stated, it is the province of the bibliographer to be acquainted with the materials of which books are composed, and their different forms, the number of pages, the typographical character, the number and description of the plates, the completeness, correctness, and all the other external peculiarities or distinctions of an edition. He knows not only the treatises that have been written on any particular topic, their comparative value, and the various editions of books, but also in what important respects one edition differs from another; when and from what cause omissions have been made, deficiencies supplied, errors corrected, and additions subjoined. When books have been published anonymously, or pseudonymously, he indicates the real name of the concealed author; and with regard to the rarity of books, he is acquainted with all the causes which have contributed to render them scarce. Finally, as a library destitute of arrangement is a "chaos and not a cosmos," he disposes the books which it comprises, in such an order as will present an agreeable appearance to the eye; and in compiling a catalogue, he assigns to them that place which they ought to hold in the system of classification adopted for arranging a public or private collection of books. Such are the legitimate duties of the bibliographer, requiring a variety and extent of knowledge, seldom if ever possessed by a single individual. Hence different writers have discussed particular topics of bibliography; and from their united labors can be collected the multifarious information requisite to constitute the well-informed bibliographer. A collection of

all the works belonging to the various departments of this science, including general and special bibliography, would, it has been estimated, exceed 20,000 volumes. The more important of these are indicated or described in Namur's *Bibliographie paléographico-diplomatique-bibliographique générale*, 2 vols. 8vo. Liège, 1888; also in Peignot's *Repertoire bibliographique universel*, 8vo. Paris, 1812; Horne's "Introduction to the study of Bibliography," vol. ii., 8vo. Lond. 1814; Bohn's "General Catalogue," vol. i., 8vo. Lond. 1847; and Petzholdt's *Anzeiger für Literatur der Bibliothekwissenschaft*, an important German periodical commenced in 1840. For information upon certain points connected with bibliography, the reader is referred to the articles BOOK, BOOK-SELLING, BOOK-BINDING, CATALOGUES, DIPLOMATICS, ENGRAVING, LIBRARIES, MANUSCRIPTS, PAPER, PRINTING, and WRITING. The following elementary works treat generally upon all matters appertaining to this science. Although not very recent, and a part of them not well digested, they, nevertheless, contain much curious as well as useful information:

- ACHARD (C. F.) Cours élémentaire de Bibliographie. 8 vols. 8vo. Marseille, 1806-7.  
BOULARD (S.) Traité élémentaire de Bibliographie. 8vo. Paris, 1806.  
DENIS (M.) Einleitung in die Bücherkunde. 2d ed. 3 vols. 4to. Wien, 1795-6.  
DREBIN (T. F.) Bibliographical Decameron. 8 vols. royal 8vo. London, 1817.  
HORNE (T. H.) An Introduction to the Study of Bibliography. 3 vols. 8vo. London, 1814.  
PEIGNOT (G.) Dictionnaire Raisonné de Bibliologie (with supplement). 3 vols. 8vo. Paris, 1802-4.  
MORTILLARO (V.) Studio Bibliografico. 2d ed. 8vo. Palermo, 1882.

We purpose, in the further discussion of this article, to give a select list of some of the sources of information upon a few of the most important branches of bibliography, arranging them in alphabetical order under their appropriate heads, and adding occasional explanatory notes and remarks.

# I.—The Origin and Progress of Writing, Manuscripts and Diplomatics, Monograms and Autographs, Materials for Writing or Printing, Engraving on Wood, Copper, Stone, &c.

The subjects belonging to this section have furnished topics for much elaborate research, and some of them for speculations and disputes not yet brought to any satisfactory conclusion. Our object is simply to indicate the inquiries which belong to different departments of bibliography, with some of the best guides to information upon each, leaving the discussion of the topics themselves for separate articles.

## 1. WRITING.

- ASTLE (THOS.) The Origin and Progress of Writing, as well hieroglyphic as elementary. A new edition of this important work has been published by Rowe, in 1 vol. royal quarto. Illustrated by Engravings. 2d ed. 4to. London, 1808.  
CHAMPOLLION-FIGEAC (J. J.) Précis du Système Hiéroglyphique des anciens Égyptiens, avec planches. 2d ed. royal 8vo. Paris, 1838.  
FONTA D'URBAN. Essai sur l'Origine de l'Écriture, sur son Introduction dans la Grèce, et son Usage, jusqu'au Temps d'Homère. 8vo. Paris, 1832.  
FRY (E.) Pantographs; containing accurate copies of all the known alphabets in the world, together with an Eng-

lish explanation of the force or power of each letter. Royal 8vo. London, 1799.

- SILVERMAN (J. B.) Paléographie universelle. Collection de fac-simile d'Écritures de tous les Peuples, et tous les temps, etc., et accompagnées d'Explications historiques et descriptives par M.M. Champollion-Figeac et Almé Champollion Fils. 4 vols. folio. Paris, 1838.  
WAILLY (M. N. DE.) Éléments de Paléographie. 3 vols. royal 4to. Paris, 1838.

## 2. MANUSCRIPTS AND DIPLOMATICS.

- DELANDIERE (A. F.) Manuscrits de la Bibliothèque de Lyon. Précédés d'un Essai sur les MSS. en général, &c. 3 vols. 8vo. Lyon, 1812.  
EBERT (F. A.) Zur Handschriftenkunde. 2 vols. 8vo. Leipzig, 1856-7.  
HUMPHREYS (H. N.) The Illuminated Books of the Middle Ages: An Account of the Development and Progress of the Art of Illumination, as a distinct branch of Pictorial Ornamentation, &c. Illustrated by a series of examples, of the size of the originals, by Owen Jones. Folio. London, 1849.  
A splendid and costly work.  
MABILLON (J.) De Re Diplomatica Libri Sex, cum Supplemento. 8d ed. 3 vols. folio (fine plates). Neapoli, 1789.  
MONTFAUCON (DOM B. DE.) Bibliotheca Bibliothecarum Manuscritorum Nova. 3 vols. folio. Paris, 1739.  
NOUVEAU Traité de Diplomatique. Par deux Religieux Bénédictins de la Cong. de S. Maur. (M.M. Toussaint and Tassin.) 6 vols. 4to. Paris, 1750.  
VAIHES (DOM DE.) Dictionnaire Raisonné de Diplomatique. 3 vols. 8vo. Paris, 1774.  
A compendium of the larger and more costly works of Mabillon, Montfaucou, Hainet, Toussaint, Tassin, &c.

## 3. MONOGRAMS AND AUTOGRAPHES.

- BRULLIOT (F.) Dictionnaire des Monogrammes, Marques figurées, Lettres initiales, Noms abrégés, etc., avec lesquels les Peintres, Dessinateurs, Graveurs et Sculpteurs ont désigné leurs Noms. 2d ed. 8 parts, 4to. Munich, 1832-4.  
"Ouvrage très important."—Brunet.  
FONTAINE (P. J.) Des Collections des Autographes et de l'Utilité qu'on peut en retirer. 8vo. Paris, 1834.  
FONTAINE (P. J.) Manuel de l'Amateur des Autographes. 8vo. Paris, 1836.  
PEIGNOT (G.) Recherches historiques et bibliographiques sur les Autographes et sur l'Autographie. 8vo. Dijon, 1836.

## 4. MATERIALS FOR WRITING OR PRINTING.

- KOOPS (M.) Historical Account of the Substances which have been used to describe events and to convey ideas, from the earliest date to the invention of paper. 8vo. London, 1801.  
LE NORMAND (L. S.) Manuel du Fabricant de Papiers, etc. (with plates.) 3 vols. 12mo. Paris, 1834.  
PEIGNOT (G.) Essai sur l'Histoire du Parchemin et du Vellin. 8vo. Paris, 1812.  
TAYLOR (ISAAC.) History of the Transmission of Ancient Books to modern times (containing the history of manuscripts, an account of the materials of ancient books, instruments of writing, inks, &c.) 8vo. London, 1837.  
WEHRS (G. F.) Von Papier, &c. (With supplement.) 3 vols. 8vo. Halle and Hanover, 1739-50.

## 5. ENGRAVING ON COPPER, WOOD, STONE, &c.

- BARTHOLO (A. DE.) Le Peintre Graveur. 21 vols. 8vo. Vienne, Degen, et Mechetti, 1808-21.  
BRYAN (M.) A Biographical and Critical Dictionary of Painters and Engravers; with the Ciphers, Monograms, and Marks used by each Engraver. (New ed. revised and enlarged by Stanley.) Royal 8vo. London, 1849.  
ENGELMANN (G.) Traité théorique et pratique de Lithographie. 3d ed. 4to. Paris, 1839.  
HEINECKEN (M. LE BARON.) Idée générale d'une Collection complète d'Estampes, avec une Dissertation sur l'Origine de la Gravure. 8vo. Leipzig, 1771.  
A valuable work, illustrated with 26 fine engravings.  
FIELDING (T. H.) The Art of Engraving; being an historical and distinct account of the various styles now practised, with instructions as to the various modes of operation, &c. Royal 8vo. London, 1840.  
JACKSON (J.) A Treatise on Wood Engraving, historical and practical. Royal 8vo. London, 1839. With upward of 800 illustrations.  
The author in the 2d chapter discusses the claims of Gutenberg and Coster to the honor of the invention of printing, supporting those of the former.  
NAGLER (Dr. G. K.) Neues Allgemeines Künstler-Lexicon. 22 vols. 8vo. München, 1835-52.  
The best and most extensive work of the kind extant, being a biographical dictionary, with critical notices, of the works of painters, sculptors, engravers, draftsmen, lithographers, &c.  
OTTLEY (W. Y.) History of Engraving upon Copper and

- Wood, with an Account of Engravers and their Works. 2 vols. royal 4to. London, 1816.  
 BORNHAY (S. L.) *Principia Typographica*. The Block-Books issued in Holland, Flanders, and Germany, during the 15th century. 8 vols. 4to. London, 1838.  
 SPOONER (S.) *A Biographical and Critical Dictionary of Painters, Engravers, Sculptors, and Architects, with the Monograms, Ciphers, and Marks used by Distinguished Artists to Certify their Works*. 8vo. New York, 1853.

## II.—The Origin and Progress of Printing, and Early Printed Books.

The history of the origin of this most important of all human inventions is enveloped in mystery, the most widely opposite opinions upon the subject being still entertained. Although within twenty years from its discovery it was spread all over Europe, commemorating all other inventions, and handing down to posterity every important event, it has unfortunately failed to record in decisive terms the name of its own inventor. To determine this, as well as the place where the discovery was made, has given employment to the studies and researches of the most learned men in Europe during the last 2 centuries. We can only point out some of the most important publications on the subject, together with manuals and dictionaries of the art, and such works as are particularly descriptive of early printed books.

- AMES (J.) *Typographical Antiquities; being an Historical Account of Printing in England, Scotland, and Ireland*. 2d edition, enlarged by Herbert. 8 vols. 4to. London, 1735-50.  
A third and very costly edition was prepared by Dibdin, greatly enlarged, with copious notes, &c. 4 vols. 4to. London, 1810-19.  
 AUDIFFREDI (J. B.) *Catalogus Historico-Criticus Romanarum Editionum Seculi XV. Also, Specimen Historico-Criticum Editionum Italicarum Seculi XV*. 9 vols. 4to. Roma, 1733-54.  
 BANDINI (A. M.) *De Florentina Jantarum Typographia*. 2 vols. 8vo. Lucan, 1791.  
 COTTON (HENRY.) *Typographical Gazetteer*. 3d edition, 8vo. Oxford, 1852.  
 DAUBOUR (P. C. F.) *Analyse des Opinions diverses sur l'Origine de l'imprimerie*. 8vo. Paris, 1808.  
 DIBDIN (T. F.) *Bibliotheca Spencoriana; or, a Descriptive Catalogue of Early Printed Books, and of many important first editions in the library of Earl Spencer*. 4 vols. royal 8vo. London, 1814-15.  
This library contained 45,000 volumes, mostly of rare and costly works.  
 FALKENSTEIN (KARL.) *Geschichte der Buchdruckerkunst*. 4to. Leipzig, 1840.  
 GREENWELL (W. P.) *Annals of Parian Typography*. 8vo. London, 1818. Also, *View of the Early Parian Greek Press*. 3 vols. 8vo. Oxford, 1838.  
 HAIN (L.) *Repertorium Bibliographicum*. 4 vols. 8vo. Stuttgart, 1826-38.  
Containing 16,299 articles describing with great accuracy all the editions of the 15th century known to the author.  
 HANBARD (T. C.) *Typographia: An Historical Sketch of the Origin and Progress of Printing*. Royal 8vo. London, 1825. Also, *History of the Art of Printing, Copperplate Printing, Type Founding, and Lithographic Printing*. 8vo. Edinburgh, 1840.  
 HODGSON (THOS.) *An Essay on the Origin and Progress of Stereotype Printing, including a description of the various processes*. 8vo. Newcastle, 1820.  
Only 205 copies printed.  
 JOHNSON (J.) *Typographia, or the Printer's Instructor*. 2 vols. 8vo. London, 1824.  
 LAIRE (F. X.) *Index Librorum ab Inventis Typographia ad annum 1500 (with a Supplement)*. 3 vols. 8vo. Paris, 1791-3.  
 MAITTAIRE (M.) *Annales Typographiques ad annum 1664, cum Supplemento Denisii*. 7 vols. (or 11 when the parts are bound up separately), 4to. Hag. Com. et Vienne, 1719-39.  
 MEERMAN (G.) *Origines Typographicæ*. 2 vols. 4to. Hag. Com. 1763.  
The great work in support of the pretensions of Lawrence Coster as the inventor, and of Haarlem as the birth-place of the art of printing.  
 PARKER (G. W.) *Annales Typographiques ad annum 1584*. 11 vols. 4to. Norimb. 1798-1808.  
The most extensive work extant on the productions of the 15th century.  
 RENOUARD (A. A.) *Annales de l'imprimerie des Alde*. 2d edition, 3 vols. 8vo. Paris, 1825. Also, *Annales de l'imprimerie des Estienne*. 2 parts, 8vo. Paris, 1837-8.

- SANTANDER (M. DE LA SENA.) *An Historical Essay on the Origin of Printing*. Translated from the French. 8vo. Newcastle, Hodgson, 1819.  
 SAVAGE (W.) *Dictionary of the Art of Printing*. Thick 8vo. London, 1841.  
 BROWNE (C.) *The Printer's Grammar (with plates)*. 8vo. London, 1808.  
 THOMAS (ISAAK.) *History of Printing in America, with Biographies of Printers, and an Account of Newspapers, &c.* 2 vols. 8vo. Worcester, 1810.  
 TIMPERLEY (C. H.) *Encyclopædia of Literary and Typographical Anecdotes*. 2d edition, thick royal 8vo. London, 1842.  
 WILLET (R.) *A Memoir on the Origin of Printing*. 8vo. Newcastle, 1820, pp. 72.  
Only 150 copies printed.  
 WOLFSTUS (J. C.) *Monumenta Typographica*. 2 thick vols. 8vo. Hamburg, 1740.

## III.—Rare, Anonymous, and Pseudonymous Books.

### 1. RARE BOOKS.

One of the objects of bibliography is to indicate those books which, to a greater or less degree, come under this category. With regard to these compilations we may remark, that though in most of them the epithet *rare* is sometimes applied too vaguely and lavishly, they are nevertheless, as a class, extremely useful. It is, indeed, exceedingly difficult to speak in all cases with precision in regard to rare books, and hence, perhaps, impossible to compile a work of this kind which shall not sometimes mislead those who consult it. A distinction should always be made between the terms *rare* and *precious*, which, while at first they appear to mean the same thing, are yet essentially different. A book may be rare because it is with difficulty to be procured, and hence highly valued by amateurs who desire the exclusive possession of it, regardless of cost. On the other hand, books may be precious, and to be obtained only at a high price, without being rare. Such are the splendid collections of architectural engravings published by Piranesi and others; the collections called galleries and cabinets; the great collections of works on antiquities by Gronovius, Grævius, Montfaucon, Muratori, and others. The following may be noticed as among the principal bibliographical works under this head, in addition to Audiffredi, Dibdin, Hain, Laire, Maittaire, and Panzer, described under the previous head.

- BAUER (J. J.) *Bibliotheca Librorum Rariorum Universalis*. (With supplement.) 7 vols. 8vo. Norimb. 1770-91.  
 CLÉMENT (DAVID.) *Bibliothèque Curieuse; ou Catalogue Raisonné des Livres rares, et difficiles à trouver*. 9 vols. 4to. Göttingen and Leipzig, 1790-90.  
Comes down no further than to the letter H.  
 DIBDIN (T. F.) *A Bibliographical, Antiquarian and Pictorial Tour in France and Germany (containing a fund of information in regard to manuscripts, rare books, &c.)*. 8 vols. royal 8vo. London, 1821.  
 DIBDIN (T. F.) *A Bibliographical and Pictorial Tour in the counties of England and in Scotland*. 3 vols. royal 8vo. London, 1828.  
 FOURMIES (F. J.) *Nouveau Dictionnaire portatif de Bibliographie; contenant plus de vingt-trois mille Articles de Livres rares, curieux, estimés, et recherchés, &c.* 2d edition, 8vo. Paris, 1809.  
 GERDEIUS (D.) *Florilegium Historico-Criticum Librorum Rariorum, &c.* 3d edition, 8vo. Groningæ, 1763.  
 HARTSHORN (C. H.) *Book Rarities of the University of Cambridge*. 8vo. London, 1829.  
 OSMONT (J. B. L.) *Dictionnaire typographique, historique, et critique des Livres rares, singuliers, estimés, &c.* 2 vols. 8vo. Paris, 1763.

- PRIGNOT (G.) *Essai de Curiosités Bibliographiques*. 8vo. Paris, 1804.  
 PRIGNOT (G.) *Variétés, Notices et Raretés bibliographiques*. 8vo. Paris, 1822.  
 PRIGNOT (G.) *Répertoire de Bibliographies spéciales, curieuses, et instructives*. 8vo. Paris, 1810.  
 SANTANDER (M. DE LA SERNA.) *Dictionnaire Bibliographique choisi du Quinzième Siècle; ou Description des Éditions les plus rares, &c.* 3 vols. 8vo. Bruxelles et Paris, 1806-7. The first volume contains an elaborate history of printing, noticed under a previous head.  
 SCHLEIERER (J. G.) *Amonitates Literaræ* (nothing rare books, &c.) 2d edit. 14 vols. 8vo. Lips. 1725-31.  
 VAN PRANT (M.) *Catalogue des Livres imprimés sur Vellin, de la Bibliothèque du Roi*. 6 vols. 8vo. Paris, 1822-3.  
 VAN PRANT (M.) *Catalogue des Livres imprimés sur Vellin, qui se trouvent dans des Bibliothèques publiques et particulières*. 4 vols. 8vo. Paris, 1824-3.  
 VOOR (J.) *Catalogus Historico-Criticus Librorum Rariorum*. 8th ed. thick 8vo. Norimb. 1793.

## 2. ANONYMOUS AND PSEUDONYMOUS BOOKS.

Anonymous books are those which are published without any author's name. Cryptonymous books are those whose names are concealed under an anagram, or similar contrivance. Pseudonymous books are those which bear false names of authors. The great number of works embraced under these classes renders this a very important branch of bibliographical inquiry.

- BARBIER (A. A.) *Dictionnaire des Ouvrages Anonymes et Pseudonymes*. 2d ed. 4 vols. 8vo. Paris, 1822-7. The best work on the subject; confined, however, to French and Latin books.  
 LANZOTTI (V.) *Pseudonimia Ovvero Tavole Alfabetiche de' Nomi, &c.* 8vo. Milan, 1826.  
 MARIN (M. DE) *Norvean Recueil d'Ouvrages Anonymes et Pseudonymes*. 8vo. Paris, 1824.  
 PLACIUS (J.) *Theatrum Anonymorum et Pseudonymorum*. (Edited by Fabricius and Dreyer.) 2d ed. fol. Hamburg, 1703. To which should be added a supplement by J. C. Mylius, published in 1740, folio.  
 QUÉRAUD (J. M.) *Les Écrivains Pseudonymes et autres Mystificateurs de la Littérature Française, &c.* 8vo. Paris, 1854-5.  
 SCHMIDT (A. G.) *Gallerie Deutscher Pseudonymen Schriftsteller, &c.* 8vo. Grimma, 1840.

## IV.—Oriental and Classical Languages.

- BOHN (H. G.) *General Catalogue*. Part second. Greek and Latin Classics, Commentaries, and Translations. 8vo. London, 1850.  
 CLARKE (A.) *Bibliographical Dictionary, with supplement*. 8 vols. small 8vo. London, 1806-8.  
 DIDOT (T. F.) *Introduction to a Knowledge of rare and valuable Editions of the Greek and Roman Classics*. 4th ed. 2 vols. 8vo. London, 1837.  
 ENGELMANN (W.) *Bibliotheca Scriptorum Classicorum, et Græcorum, et Latinorum*. (6th ed. of Enslin's Bibliotheca, enlarged, &c., with a supplement.) 8vo. Lips. 1847-58.  
 FABRICIUS (J. A.) *Bibliotheca Græca, ed. Harles*. 4th ed. 12 vols. 4to. Hamburg, 1790-1809.  
 FABRICIUS (J. A.) *Bibliotheca Latina, ed. Ernesti*. 3 vols. 8vo. Lips. 1778-84.  
 FABRICIUS (J. A.) *Bibliotheca Latina Mediæ et Infimæ Ætatis*. 6 vols. 4to. Patavii, 1754.  
 HAJI-KHALFA-MUSTAFA (B. A. K. I.) *Lexicon bibliographicum et encyclopedicum, &c.* (A work on oriental bibliography, edited by G. Flügel.) 8 vols. 4to. Leipzig and London, 1835-52.  
 HERBELLOT (B. D.) *Bibliothèque Orientale, augmentée par Schultens*. Best edition. 4 vols. 4to. La Haye, 1772-82.  
 HOFFMANN (S. F. W.) *Bibliographisches Lexicon der gesammten Literatur der Griechen*. 2d ed. 3 vols. 8vo. Leipzig, 1838-45.  
 HOFFMANN (S. F. W.) *Handbuch zur Bücherkunde für Lehre und Studium der beiden alten Classischen und Deutschen Sprache*. 8vo. Leipzig, 1833.  
 MOSE (J. W.) *Manual of Classical Bibliography*. New ed. 2 vols. 8vo. London, 1837.  
 SCHWENKE (F. L. A.) *Handbuch der Classischen Bibliographie*. 8 vols. 8vo. Leipzig, 1830-4.  
 WOLFIUS (J. C.) *Bibliotheca Hebræa*. 4 vols. 4to. Hamb. 1715-28.  
 ZENKER (J. T.) *Manuel de Bibliographie Orientale*. 8vo. Leipzig, 1844.

## V.—Bibliography of Modern Nations, or National Bibliographies.

### 1. AMERICA.

- ASHER (G. M.) *Bibliographical and Historical Essay on the Dutch Books and Pamphlets relating to New Netherland*. 6 pts. small 4to. Amsterdam, 1855.  
 ASPINWALL (J.) *Bibliotheca Americana Septentrionalis*. 8vo. Paris, 1830.  
 BIBLIOGRAPHICAL CATALOGUE of Books, Translations of the Scriptures, and other Publications in the Indian Tongues of the United States. 8vo. Washington, 1849.  
 BIBLIOTHECA AMERICANA; or, a Chronological Catalogue of the most curious and interesting Books, Pamphlets, &c., upon North and South America. 4to. London, 1789.  
 DALRYMPLE (A.) *Catalogue of Authors who have written on the Rio de la Plata, &c.* 4to. London, 1807.  
 DUTCHINGK (E. A. and G. L.) *Cyclopedia of American Literature*. 8 vols. royal 8vo. New York, 1854.  
 FARIBAUT, (B. G.) *Catalogue des Ouvrages sur l'Histoire de l'Amérique*. (Especially pertaining to those parts of America formerly in the possession of the French.) 3 pts. 8vo. Quebec, 1837.  
 KENNET (W.) *Bibliotheca Americana Primordia*. 4to. London, 1712.  
 LUDWIG (H. E.) *The Literature of American Local History; a Bibliographical Essay*. 8vo. New York, 1844.  
 MEUSEL *Bibliotheca Historica*. Vols. 8 and 10. Described under another head.  
 NORTON'S *Literary Register; or, Annual Book List for the year 1855*. 8vo. New York, 1855.  
 RICH (O.) *A Catalogue of Books relating principally to America, arranged under the years in which they were printed, from 1500 to 1700*. 8vo. London, 1832. Containing 426 articles.  
 RICH (O.) *Bibliotheca Americana Nova, since 1700*. 8vo. London, 1835.  
 RICH (O.) *Supplement. 1701-1800*. 8vo. London, 1841. The Bibliotheca and Supplement contain 2,522 articles.  
 RICH (O.) *Bibliotheca Americana Nova. 1801-1844* (With an index). 8vo. London, 1846.  
 ROOSEBACH (O. A.) *Bibliotheca Americana: Catalogue of American Publications, including Reprints and Original Works, from 1820 to 1852; with supplement to 1855*. Large 8vo. New York, 1855. Addenda to March 1, 1858.  
 TERNAUX-COMPAENS (H.) *Bibliothèque Américaine*. 8vo. Paris, 1837. Contains the titles of 1,153 works published previous to the year 1700.  
 TRUBNER'S *Bibliographical Guide to American Literature*. 12mo. London, 1856.  
 WARDEN (D. B.) *Bibliotheca Americana; being a choice collection of American Books, &c.* 8vo. Paris, 1840.  
 The inquirer under this head will also consult *Literary World*, 15 vols. 4to. New York, 1847-'58; *Norton's Literary Gazette*, 8 vols. small folio, and 1 vol. 4to. New York, 1851-'4; *Norton's Literary Almanac and Register for 1852, 1853, and 1854*; *Publishers' Circular*, a weekly periodical commenced in New York in 1855, and still continued; *Portfolio*, 5 vols. 4to and 42 vols. 8vo. Phila. 1801-'27; *Analectic Magazine*, 16 vols. 8vo. Phila. 1818-'20; *North American Review*, *Christian Examiner*, *Methodist Quarterly*, *New York Review*, *Silliman's Journal*, *Democratic Review*, *Southern Quarterly Review*, and other leading periodicals of the day.

### 2. GREAT BRITAIN.

- ANDERSON (C.) *Annals of the English Bible*. (Containing a list of the various editions, &c.) 2 vols. 8vo. London, 1845.  
 BELOW (WM.) *Anecdotes of Literature and Scarce Books*. 8vo. London, 1807-'12.  
 BORN (J.) *Catalogue of an Extensive Collection of English Books*. 8vo. London, 1829.  
 BAYDEMS (S. E.) *Censura Literaria; containing Titles, Abstracts, and Opinions of old English Books*. 10 vols. 8vo. Lond. 1814.  
 BAYDEMS (S. E.) *The British Bibliographer*. 4 vols. 8vo. Lond. 1810-'14.  
 BAYDEMS (S. E.) *Restituta; or, Titles, Extracts, and Characters of old books in English Literature, revised*. 4 vols. 8vo. Lond. 1814-'16.  
 CORRON (H.) *Editions of the Bible and Parts thereof in English*. 2d ed. 8vo. Oxford, 1852.

- GRIFFITH (A. F.) *Bibliotheca Anglo-Poetica; or, a Descriptive Catalogue of a rare and rich collection of early English Poetry.* 8vo. Lond. 1815.
- HUME (A.) *The Learned Societies and Printing Clubs of the United Kingdom (with lists of their publications, &c.).* 9d. ed. post 8vo. Lond. 1858.
- LONDON CATALOGUE of Books, with their sizes, prices, and publishers; containing the books published in London, from 1700 to 1844. 8vo. Lond. various dates.
- LONDON CATALOGUE of Books published in Great Britain, 1831-55. 8vo. Lond. T. Hodgson, 1855.
- LONDON CATALOGUE. *Bibliotheca Londinensis: A Classified Index to the Literature of Great Britain during 80 years; arranged from and serving as a key to the London Catalogue, 1814-44.* 8vo. Lond. T. Hodgson, 1848.
- LOW (S.) *The British Catalogue of Books published from Oct. 1837 to Dec. 1851. Vol. 1. General Alphabet.* 8vo. Lond. 1852.
- LOWDES (W. T.) *The Bibliographer's Manual of English Literature.* 4 vols. 8vo. Lond. 1831.  
Containing notices of upward of 50,000 distinct books. A new edition is now printing by Bohn, the first volume of which has already appeared.
- MAGEAY (W. D.) *A Manual of British Historians to A. D. 1600.* 8vo. Lond. 1845.
- MARTIN (J.) *Bibliographical Catalogue of Books privately printed in England.* 3 vols. imp. 8vo. Lond. 1884.
- MOULE (T.) *Bibliotheca Heraldica Magnæ Britanniae: An Analytical Catalogue of Books on Genealogy, Heraldry, Nobility, Knighthood, and Ceremonies.* Royal 8vo. Lond. 1833.
- NICHOLS (J.) *Literary Anecdotes of the Eighteenth Century.* 16 vols. 8vo. Lond. 1812-43.
- PUBLISHERS' CIRCULAR and General Record of British and Foreign Literature. Vols. 1-20. 8vo. Lond. 1837-57.
- REID (J.) *Bibliotheca Scoto-Celtica; or, an Account of all the Books which have been published in the Gaelic Language.* 8vo. Lond. 1833.
- SAVAGE (J.) *The Librarian; being an Account of Scarce, Valuable, and Useful English Books.* 3 vols. 8vo. Lond. 1808-12.
- SMITH (J. R.) *A Bibliographical List of all Works Illustrating the Provincial Dialects of England.* 8vo. Lond. 1844.
- STEVENS (H.) *Catalogue of my English Library.* Post 8vo. Lond. 1853.  
Giving a select list of 5,751 volumes.
- UPCOOT (W.) *Bibliography of Works on British Topography.* 3 vols. 8vo. Lond. 1818.
- WALPOLE (H.) *Catalogue of Royal and Noble Authors of England; enlarged by Park.* 5 vols. 8vo. Lond. 1806.
- WEIGHT (T.) *Biographia Britannica Literaria. Anglo-Saxon and Norman Periods. (With lists of works, &c.)* 3 vols. 8vo. Lond. 1842-6.
- WATT (R.) *Bibliotheca Britannica; or, a General Index of British and Foreign Literature.* 4 vols. 4to. Edin. 1834.  
Vols. 1 and 2, alphabetical; vols. 3 and 4, index.

## 3. FRANCE.

- BIBLIOGRAPHIE DE LA FRANCE. (A bibliographical periodical commenced in 1810, and published, at Paris in an octavo form.)
- BOSMANGÉ (H.) *Ma Bibliothèque Française.* Post 8vo. Paris, 1856.  
Giving a select list of about 1,000 volumes of the best editions of standard French authors. Bosmangé also published in 1845 a large octavo volume of foreign books, mostly French, arranged according to subjects, with prices, a general index, &c. He has since published two supplements.
- DESSERTE (N. L. M.) *Les Siècles Littéraires de la France.* (Bibliographical dictionary of French writers to the end of the 18th century, with supplements.) 7 vols. 8vo. Paris, 1800-3.
- Dictionnaire Biographique et Bibliographique des Prédicateurs et Sermonnaires Français, par l'Abbé de la P. 8vo. Paris, 1824.
- GIRAULT DE SAINT-FARGEAU (A.) *Bibliographie Historique et Topographique de la France.* 4to. Paris, 1845.
- GONAT (P. M.) *Bibliographie Historique de la Ville de Lyon pendant la Révolution Française.* 8vo. Lyon, 1845.
- LELONG (Le P. J.) *Bibliothèque Historique de la France.* 5 vols. 8vo. Paris, 1768-78.  
Containing 50,000 articles, 9 indexes, and a table of anonymous authors.
- QUÉRAUD (J. M.) *La France Littéraire, ou Dictionnaire Bibliographique, &c. (18th and 19th centuries.)* 10 vols. 8vo. Paris, 1837-39.
- QUÉRAUD (J. M.) *La Littérature Française contemporaine, 1837-49.* (Commenced by Quérard, and continued by Félix Bourquelot.) 6 vols. 8vo. Paris.
- QUÉRAUD (J. M.) *Les Supercherches Littéraires Dévoilées, Galeries des Auteurs apocryphes, supposés, déguisés, &c. de la Littérature Française.* 4 vols. 8vo. Paris, 1847-53.
- VENTOUILLE (L. T.) *The French Librarian.* 8vo. Lond. 1829.

Brunet's *Manuel du Libraire*, described under another head, although a general work, is very rich in French bibliography; so also is the *Bibliographie Universelle*, a bibliographical as well as biographical work, of the highest authority.

## 4. GERMANY.

- ASHER (A.) *A Bibliographical Essay on the Scriptores Rerum Germanicarum.* 4to. London and Berlin, 1843.
- BUCKNER (E.) *Bibliographisches Handbuch der Deutschen Dramatischen Literatur.* 4to. Berlin, 1837.
- ENGELMANN (W.) *Bibliotheca Geographica.* 2 vols. 8vo. Lips. 1853.  
A classified catalogue of all the works on geography and travels published in Germany, from the middle of the 14th century down to 1846; with prices, index, &c.
- ENGELMANN (W.) *Bibliothek der Schönen Wissenschaft.* (A list of German romances, plays, and poems, published from 1750 to 1845.) 2 vols. 8vo. Leipzig, 1837-46.
- ENGELMANN (W.) *Bibliotheca Philologica.* (A list of Greek and Latin grammars, dictionaries, &c., published from 1750 to 1852.) 3d ed. 8vo. Lips. 1853. Also, *Bibliotheca Mechanico-Technologica*, 1 vol.—*Bibliotheca Scriptorum Classicorum*, 1 vol.—*Medico-Chirurgica*, 1 vol.—*Economica*, 1 vol.—*Veterinaria*, 1 vol.—*Zoologica et Palaeontologica*, 1 vol.—*Bibliothek der Forst und Jagdwissenschaften*, 1 vol.—*Bibliothek der Handlungswissenschaft*, 1 vol.—*Bibliothek der Neuern Sprachen*, 1 vol.
- ESCH (J. S.) *Handbuch der Deutschen Literatur.* 2d ed. 4 vols. 8vo. Leipzig, 1822-45.  
A classified catalogue of all the books published in Germany from the middle of the 15th century.
- HEINSIUS (W.) *Allgemeines Bücherlexikon.* (With 5 supplements.) 13 vols. 4to. Leipzig, 1812-49.  
An alphabetical catalogue of all the books published in Germany, from 1700 to 1846; with sizes, prices, and publishers' names.
- HINZON (T. C.) *Verzeichnisse der Bücher, Landkarten, &c. (Catalogue of all the books, maps, &c., including new editions, published in Germany from year to year, with sizes, prices, publishers, and classified indexes.)* 63 vols. 12mo. Leipzig, 1797-1853.  
Published by Hinrichs, in common with other booksellers.
- JULIUS (N. H.) *Bibliotheca Germano-Glottica.* 8vo. Hamburg, 1817.
- KATZER (C. G.) *Vollständiges Bücher-Lexikon.* (With 8 supplements.) 13 vols. 4to. Leipzig, 1834-58.  
An alphabetical catalogue, like that of Heinze, of all books, &c., published from 1700 to 1852.
- SCHWAB (G.) *Wegweiser durch die Literatur der Deutschen.* Ein Handbuch für Laien; herausgegeben von Gustav Schwab und Karl Klüpfel. 3d ed. 8vo. Leipzig, 1847.  
An indispensable guide in the formation of a select German library.
- TAYLOR (W.) *Historic Survey of German Poetry.* 3 vols. 8vo. London, 1828-30.
- THIMM (F. L. J.) *The Literature of Germany, from its earliest period. (With bibliographical notes, &c.)* 12mo. London, 1844.

Ebert's "General Bibliographical Dictionary," described under another head, is especially rich in early German literature.

## 5. ITALY.

- BIBLIOGRAFIA ITALIANA. (A bibliographical periodical, commenced in 1835, and continued until the close of 1846.) 12 vols. 8vo. Milan, 1835-46.
- BIBLIOGRAFIA od Elenco Ragionato delle Opere contenute nella Collezione de' Classici Italiani. 8vo. Milan, 1814.
- BIBLIOGRAFIA dei Romanzi e Poemi Cavallereschi Italiani. (By G. de' Conti Melzi.) 2d ed. 8vo. Milan, 1833.
- BRYDESS (E.) *Res Literaria, Bibliographical and Critical.* (Principally upon Italian literature.) 5 vols. 8vo. Naples, Rome, and Geneva, 1821-2.
- CANTU (J.) *L'Italia Scientifica Contemporanea.* 8vo. Milan, 1844.
- FONTANINI (G.) *Biblioteca dell'Eloquenza Italiana, con le Annotazioni del Signor Apostolo Zeno.* 2 vols. 4to. Parma, 1808-9.  
An index to this last edition was published in 1811.
- GAMBA DA BASSANO (B.) *Delle Novelle Italiane in Prosa.* Bibliografia. 3d ed. 8vo. Firenze, 1835.  
A detailed account of the works of the Italian novelists.
- GAMBA DA BASSANO (B.) *Serie dei Testi di Lingua.* 4th ed. royal 8vo. Venezia, 1839.  
A general Italian bibliographical dictionary, with copious notes and indexes.
- HAYS (N. F.) *Biblioteca Italiana, ossia Notizia de' Libri rari Italiani.* 2 vols. 4to. Milan, 1771-2.
- For the latest publications in Italy, the reader is referred to *Archivio Storico Italiano*, a periodical published in Florence.

## 6. SPAIN, PORTUGAL, AND NORTHERN EUROPE.

- ANTONIO (N.) *Bibliotheca Hispana Vetus ad annum 1500.* 2 vols. folio. Matriti, 1738.  
 ANTONIO (N.) *Bibliotheca Hispana Nova, ab anno 1500 ad annum 1684.* 3 vols. folio. Matriti, 1738-8.  
 BENTKOWSKI (F.) *Historia Literatury Polskiej.* (History of Polish literature, exhibited in a list of writings, &c.) 9 vols. 8vo. Warsaw and Wilna, 1814.  
 BOLWYN *Bibliografía Española.* 12mo. Madrid, 1840—  
 A periodical similar to the *Bibliografia Italiana*.  
 BOUTEWIK (F.) *History of Spanish and Portuguese Literature*, translated by Ross. 2 vols. 8vo. London, 1823.  
 CASTRO (J. E. DE) *Biblioteca Española.* 2 vols. folio. Madrid, 1781-8.  
 CASINI (M.) *Bibliotheca Arabico-Hispana Escorialensis.* 2 vols. folio. Matriti, 1760-70.  
 MACHADO (P. D. B.) *Bibliotheca Lusitana Critica et Chronologica.* 4 vols. folio. Lisboa, 1741-50.  
 NYERUP (R.) *Almindeligt Literaturlexicon for Denmark*, &c. 9 vols. 4to. Kjobenh, 1820.  
 A universal literary lexicon of Denmark, Norway, and Iceland, giving an account of authors and their works.  
 OTTO (F.) *History of Russian Literature, with a Lexicon of Russian Authors.* 8vo. Oxford, 1839.  
 RECKE and NAFERKY. *Allgemeines Schriftsteller und Gelehrten-Lexikon der Provinzen Livland, Esthland, und Rurland.* 4 vols. thick 8vo. Mitau, 1837-38.  
 SALVA (V.) *Catalogue of Spanish and Portuguese Books, with bibliographical remarks.* 2 vols. 8vo. London, 1826-7.  
 TUCKER (G.) *The History of Spanish Literature.* 3 vols. 8vo. New York, 1842.  
 WARMHOLST (O. G.) *Bibliotheca Historica Sueo-Gothica.* 15 vols. 8vo. Stockholm, 1782-1817.

## VI.—General Bibliographies.

The works which are to be considered under this section, and the one following, sometimes called dictionaries, sometimes catalogues, and sometimes bibliotheca, constitute the most generally useful and interesting class of bibliographical publications. By showing what has been written in all the various branches of human knowledge, in every age and country, they act as guides to the inquiries of the learned; while by pointing out the differences of editions, &c., they constitute manuals of ready information for the professed bibliographer. Works of this class are called general or special, according as their object is to indicate books in all, or in one only, of the departments of science or literature. The former only aspire to point out rare, remarkable, or important books; for no attempt has yet been made, or probably ever will be made, to compile a complete universal bibliographical dictionary. On the other hand, it is the object of special bibliographies to notice all, or the greater part of those books that have been published on the subjects which they embrace; and hence their superior utility to such as are engaged in the study or investigation of any particular topic. It is by means of such works, says Dr. Johnson, that "the student comes to know what has been written on every part of learning; that he avoids the hazards of encountering difficulties which have already been cleared; of discussing questions which have already been decided; and of digging in mines of literature which have already been exhausted." The following are some of the most important works of this class:

- APPLETON'S *Library Manual*: containing a Catalogue Raisonné of upward of 12,000 of the most important works in every department of knowledge. 8vo. New York, 1847.  
 BIBLIOTHECA Grenvilliana; by J. T. Payne and H. Foss. Part I., 2 vols. 8vo. Lond. 1842. Part II. 8vo. 1843.

- BOHN (H. G.) *A General Catalogue of Books.* 8vo. London, 1841, pp. 4,100.

Commonly known as the "Guinea Catalogue." It is now reprinting in 2 volumes, 2 of which have already been published.

- BRUNET (J. C.) *Manuel du Libraire et de l'Amateur de Livres.* 4th ed. 5 vols. thick 8vo. Paris, 1842-4.

The most extensive and useful work of the kind extant, containing notices of 24,000 separate works.

- DE BURE (G. F.) *Bibliographie Instructive.* 7 vols. 8vo. Paris, 1768-8.

- DIEDIN (T. F.) *The Library Companion; or, the Young Man's Guide, and the Old Man's Comfort in the choice of a Library.* Thick 8vo. London, 1824.

- DICIONNAIRE BIBLIOGRAPHIQUE. (Compiled, according to Barbier, by the Abbé du Clos.) 8 vols. 8vo. Paris, 1790.

- EBERT (F. A.) *A General Bibliographical Dictionary, from the German.* 4 vols. 8vo. Oxford, 1837.

The original edition was published at Leipzig in 1811-20, in 2 vols. 8vo.

- GEORGI (J. T.) *Allgemeines Europäisches Bücher-Lexicon, 1500-1757.* (With supplements.) 8 vols. folio. Leipzig, 1742-58.

- GRAMME (J. G. T.) *Trésor des Livres rares et précieux, ou Nouveau Dictionnaire Bibliographique.* Livr. I., in large 4to (to be completed in about 16). Dresden, 1838.

- MEUSEL (J. G.) *Bibliotheca Historica.* 22 vols. in 11, 8vo. Lips. 1793-1804.

- NODDIE (C.) *Description Raisonné d'une jolie Collection de Livres.* 8vo. Paris, 1844.

- RENOUARD (A. A.) *Catalogue de la Bibliothèque d'un Amateur, avec notes bibliographiques*, &c. 4 vols. 8vo. Paris, 1819.

- SANTANDER (M. C. DE LA SERENA.) *Catalogue des Livres de la Bibliothèque de Santander, rédigé et mis en ordre par lui-même; avec notes*, &c. 5 vols. 8vo. Bruxelles, 1808.

## VII.—Special Bibliographies.

The dictionaries and catalogues applicable to particular branches of knowledge, and comprising the works published on the subjects discussed, would of themselves constitute a library. In the present article, already extended beyond its original limits, we can only mention a few of the more important, in addition to those which have already been noticed under previous heads.

- ATKINSON (J.) *Medical Bibliography.* A and B. 8vo. London, 1824.

- BACKER (A. and A. DE.) *Bibliothèques des Écrivains de la Compagnie de Jésus.* Vols. 1 and 2. Royal 8vo. Liège, 1838-54.

To be completed in 2 volumes of 800 pages each.

- BÉRAUD (A. B. L.) *Essai Bibliographique sur les Éditions des Elzevirs.* 8vo. Paris, 1823.

- BLANQUI (M.) *Histoire de l'Économie Politique en Europe.* 2d ed. 2 vols. 8vo. Paris, 1842.

- BLAKE (C.) *Bibliographie Musicale de la France et de l'Étranger.* 8vo. Paris, 1822.

- BOUCHER DE LA RICHARDELLIE (G.) *Bibliothèque universelle des Voyages.* 6 vols. 8vo. Paris, 1808.

- BRIDGEMAN (R. W.) *Short View of Legal Bibliography.* 8vo. London, 1807.

- CAMUS (A. G.) *Profession d'Avocat.* 5th ed. 2 vols. 8vo. Paris, 1832.

An excellent work on jurisprudence and its bibliography.

- CLARK (A. and J. B. B.) *A Concise View of the Succession of Sacred Literature.* 2 vols. 8vo. London, 1830-2.

- DARLING (J.) *Cyclopædia Bibliographica: A Library Manual of Theological and General Literature.* 2 vols. royal 8vo. London, 1854-55.

- DE MOSSAN (A.) *Notices of Arithmetical Books and Authors.* Post 8vo. London, 1847.

- DUPIN (M.) *Manuel des Étudiants en Droit.* 12mo. Paris, 1835.

- DUPIN (M.) *Manuel du Droit public ecclésiastique Français.* 12mo. Paris, 1844.

Containing bibliographical notices of works upon law, &c.

- DUPLESSIS (G.) *Bibliographie Pæremologique.* (Bibliography of Proverbs.) 8vo. Paris, 1847.

- DEYANDER (J.) *Catalogus Bibliotheca Historico-Naturalis Josephi Banks.* 5 vols. 8vo. London, 1796-1800.

The most complete catalogue of books on natural history ever published. The collection now forms a part of the British museum.

- ELLIS (H.) *Catalogue of Books on Angling.* 8vo. London, 1811.

- ELMES (J.) *General and Bibliographical Dictionary of the Fine Arts.* 8vo. London, 1828.

- FORBES (J.) *Manual of Select Medical Bibliography.* Royal 8vo. London, 1835.

- HORNE (T. H.) *Manual of Biblical Bibliography.* 2d ed. 8vo. London, 1846.

HOYER (Dr. J. G. von.) *Literatur der Kriegswissenschaften und Kriegsgeschichte*. 12mo. Berlin, 1892-40.

LA LANDE (J. DE.) *Bibliographie Astronomique*. 4to. Paris, 1908.

M'CULLOCH (J. R.) *The Literature of Political Economy*. 8vo. London, 1845.

MURHARD (F. W. A.) *Bibliotheca Mathematica*. 5 vols. 8vo. Lips. 1797-1805.

Containing the literature of arithmetic, geometry, mechanics, optics, &c.

ORME (W.) *Bibliotheca Biblica: A Select List of Books on Sacred Literature, with notices, &c.* 8vo. Edin. 1834.

OTTINGER (E. M.) *Bibliographie Biographique universelle*. (Dictionary of works relative to the public and private life of celebrated personages.) 2 vols. 4to. Bruxelles, 1854.

PRECHERON (A.) *Bibliographie Entomologique*. 2 vols. 8vo. Paris, 1887.

PLOUQUET (W. G.) *Literatura Medica Digesta*. 4 vols. Royal 4to. Tubinge, 1908-9.

POOLS (W. F.) *An Index to Periodical Literature*. 8vo. New York, 1858.

An exceedingly useful book, being a complete key to the contents of fifteen hundred volumes of standard American and English periodicals.

ROY (C. H. A.) *Catalogus Bibliothecae Medicæ*. 5 vols. 8vo. Amst. 1890.

TERNAUX-COMFANS (H.) *Bibliothèque Asiatique et Africaine*. 8vo. Paris, 18--.

WALCH (J. G.) *Bibliotheca Theologica Selecta*. 4 vols. 8vo. Jena, 1757-65.

WALCH (J. G.) *Bibliotheca Patristica, Litteraribus Annotationibus instructa*. New ed. 8vo. Jena, 1894.

WIGGEL (R.) *Kunstflager-Catalog*. 8vo. Leipzig, 1845.

WINKE (G. B.) *Handbuch der theologischen Literatur*. (With a supplement.) 3d ed. 8 vols. 8vo. Leipzig, 1838-42.

**BIBLIOMANCY**, a method of consulting the future by means of the pages of some book, most usually the Holy Scriptures. In the middle ages this mode of vaticination was preceded by certain spells and ceremonials, which were supposed not merely to add to the seriousness and solemnity of the occasion, but to evoke a supernatural influence and confer a divine authority on the proceedings. The test and reply, however, were the same in all cases, consisting merely in opening the Bible, with the head averted, or with the eyes blindfolded, at any place which chance might determine, and laying the finger at hazard on any verse, which, it was believed, would reveal the fate of the person consulting the oracle. Of the same nature were the *sortes Virgilianæ*, often consulted of old with an expectation of really learning something of the occult future, as now on festive occasions for idle amusement. These *sortes* consist in opening Virgil's "*Æneid*" in the same manner, and receiving the verse on which the finger happens to rest as the prognostic of one's fate. Several singular coincidences are related, in which the information contained in the line found, and therefore predicted by the *sortes*, appears to have been confirmed by subsequent events. The most remarkable of all, however, is that of the unfortunate Charles I. of England, who, as the tale runs, many years before his disagreement with his parliament or people, while all his prospects were as bright as those of any youthful king in a peaceful age, was induced, in a moment of thoughtless gayety, amid a crowd of gay ladies and gallant courtiers, to seek his fortune in the "*Æneid*," when, to the dismay of all, he turned to the lines,

Tot populi terrisque superbum  
Regnatorem Asiæ! jacet ingens litore truncus,  
Avulsamque humeris caput, et sine nomine corpus;

which may be rendered: "The haughty sovereign of so many Asiatic realms and races! on the seashore lies the giant trunk, the head dis severed from the shoulders, and the body without a name;" a coincidence, how casual soever, which did not fail to be considered prophetic when subsequent events had confirmed the augury by the occurrence.

**BIBLIOMANIA** (Gr. *βιβλίον*, book, and *μανία*, madness), a term first introduced by Dr. Dibdin to denote a rage for possessing rare and curious books. The bibliomaniac proceeds according to certain principles, but being a lover of books rather than of knowledge, attaches himself to accidental rather than essential qualities, and spends a fortune for works the contents of which he might obtain for a few dollars. The speciality which gives value to a book may be its age or rarity, the vicissitudes through which it has passed, or the fact of its having issued from a particular publishing house. It may be a handsome and peculiar binding, fanciful typography, the circumstance that it has belonged to some eminent personage, as Napoleon, Lord Byron, or Sir Walter Scott, possessing, perhaps, an autograph or marginal notes, or that the purchaser desires it to swell a collection in some particular department of literature. Bibliomania originated in Holland near the close of the 16th century, and passed thence into England, where it has held its principal seat, though it has more recently become to some extent a passion in France and in the United States of America. Numerous collections have been made of the editions of the Bible, of which the most complete is in the British museum, though rivalled by that of Mr. James Lenox of New York; of editions of the classics in *usum Delphini*, and *cum notis variorum*; of first editions of the classics (*editiones principes*), and of many books which appeared in the infancy of typography (*incunabula*); of Bipont editions, and those cited by the academy della Crusca; of the "Republics" of the Elzevirs; and works printed by Aldus, Comino of Padua, Bodoni, Mattaire, Foulis, Barbou, and Baskerville. In France the jest-books, burlesque treatises, and macaronic poems of the 16th century, which proceeded from the school of Merlin Coccaie, Folingi, and Rabelais, have been for some time much sought after by bibliomaniacs. The bindings on which the highest prices are set in France are those of Derosne, Padeloup, Simier, and Thouvenin; and in England, those of Charles Lewis and Roger Payne. The most extraordinary prices are paid for splendid old editions, copies with a likeness of the author and painted initial letters, impressions upon parchment, morocco, paper furnished with a broad margin, or upon asbestos, printed with letters of gold or silver, or having all the text set in an impression of copper. The material is more highly esteemed if tinted rose-color, blue, yellow, or green. The library of Lord Spencer, in England, contained an *Æschylus* of the

Glasgow edition of 1795, the binding of which alone cost £16 7s. sterling. The binding of Maeklin's Bible, in 4 volumes, cost 75 guineas, and that of Boydell's large edition of Shakespeare, in 9 volumes, cost £182 sterling. The London bookseller Jeffery had a volume of the "History of James II.," by Fox, bound in fox-skin, in allusion to the name of the author, and the capricious bibliomaniac Askew pushed his madness even to having a book bound in human skin, that he might possess an entirely unique volume. The edges of books have sometimes been adorned with beautiful pictures. Books formerly were often bound in copper, silver, or gold leaf, and embellished with precious stones. The shah of Persia is said to be engaged in preparing a magnificent edition of the "Arabian Nights' Entertainments," on which artists, under his personal direction, have been at work for the last 7 years. Its preparation has already cost more than \$60,000. It is not unfrequently a passion of men to obtain an extensive library in some particular department, or a complete set of the editions of some favorite author. Thus, Boulard spent a fortune in pursuit of the editions of Racine; a professor in a university is mentioned who passed his life in collecting obscene books; and Soleinnes made a library of all the dramatic pieces that have ever appeared on any stage. He searched for new pieces with painful anxiety, purchasing a mass of books in languages which he could not read. A certain Frenchman purchased at exorbitant prices all astronomical books that he could find, though he did not understand a word of that science. Bibliomaniacs are the principal purchasers in the great antiquarian book auctions which are occasionally held in London and Paris. The Mazarin Bible, supposed to have been printed in 1455, was sold in 1827 for £504. A gentleman of New York has obtained a copy of this work at an expense of \$2,500. Alcuin's MS. Bible, which was made for Charlemagne, was recently purchased by the British museum for £750. At the sale of Cardinal Lomenie's library in Paris, 8,300 livres were given for a copy of the *Grammatica Rhythmica*, in folio, printed in 1466, by Faust and Schoeffer. A copy of Virgil, printed by Sweynheim and Pannartz, in 1469, brought 4,101 livres. Dr. Dibdin mentions that 500 guineas were offered for a Livy printed by Vindelin de Spira, in 1470, "a most extraordinary copy, bound in 8 volumes, in foreign coarse vellum." One of the most memorable competitions for bibliographic treasures occurred at the sale of the duke of Roxburgh's library, in London, in 1812. A copy of the 1st edition of the "Decameron," published by Valdarf, at Venice, in 1471, was sold for the immense price of £2,260. An illuminated missal, executed for the duke of Bedford in the reign of Henry VI., was sold, in 1786, for £208; in 1815, for £637; and in 1838, for £1,100. Great interest was recently excited at Paris by the sale of an extensively illustrated copy of Voltaire's works. The edition was that of Lefèvre, 1829

-34, in 90 volumes, and its illustration had been a work of more than 20 years. The engravings amounted to the number of 12,000, and were so carefully selected that more were said to have been rejected than were inserted. This unique copy was sold for £223. At the same sale a copy of the first complete edition of Molière was sold for £18, and an "Orlando Furioso" (Venice, 1553) for £15. Among recent sales in London were a Hebrew Bible of the 18th century, written on vellum, in the uncial character, for £70; 2 MSS. of the evangelists, on vellum, of the 9th and 10th centuries, for £70 and £81; *Hieronymi Epistola*, MS., of the 15th century, on Italian vellum, illuminated, for £45 8s.; *Discordis Anasarbai Opera*, large folio, for £590; the *Aminta Favola* of Tasso, with autograph, MS., for £59; 8 MSS. of the *Divina Commedia* of Dante, of the 14th and 15th centuries, for £40, £30 10s., and £52 10s.; De Bry's "Voyages," in 9 vols., 1590-1625, for £150. John Eliot's Indian Bible sold in New York, in 1857, for \$200, and 18 numbers of Franklin's "Poor Richard's Almanack" for \$12 per number. The most expensive single work in the United States is a copy of De Bry's "Voyages." The bibliomaniac forms the subject of the 18th chapter of the *Caractères* of La Bruyère, and Dr. Dibdin has published a volume entitled "Bibliomania, or Book-Madness."

BIBRA, ERNST, baron, a German naturalist and traveller, born at his estate of Schwabheim, in Franconia, June 9, 1806. He pursued first the study of the law, and afterward, more exclusively, that of natural science, at the university of Würzburg. After having brought out, in 1849, a chemical treatise on the liver and the bile, he made a tour of exploration to Brazil and Chili, of which he published a description in 1854, under the title of "Travels in South America." To the journals of the academy of Vienna, of which he is a member, he has contributed some interesting articles on Bolivia and Chili. His most valuable works have appeared within the last few years: "Comparative Investigations of the Brains of Men and of Vertebrate Animals" (Mannheim, 1854), and "Narcotic Enjoyments and Man" (Nuremberg, 1855). His residence in the latter city contains a valuable collection of transatlantic objects of natural history and ethnography.

BIOË, or BIAZ, among painters, a blue color prepared from the *lapis armenus*, or calcareous salt of copper. It bears the best body of all bright blues used in common work, but is the palest in color.

BICËTRE, a hospital in the immediate vicinity of Paris, on a site formerly occupied by a chateau built in the 18th century by John, bishop of Winchester. In the beginning of the 15th century the dilapidated castle was bought by the duke of Berry, the uncle of Charles VI., who erected there a magnificent new chateau, ornamented with masterpieces of art. Unhappily, it was destroyed, with all its treasures, during the civil wars. Its ruins and the

ground were given, in 1416, to the chapter of Notre Dame, and, being entirely neglected, became a resort for robbers and other offenders. Cardinal Richelieu having bought it, in 1632, founded there a military hospital, the occupants of which were removed to the Invalides in the reign of Louis XIV. Bicêtre then became an asylum for the poor, and a kind of prison where vagrants were confined. Under Louis XVI. a part of it was allotted to those suffering from venereal diseases, the patients being, by a singular rule, subjected to a severe whipping before receiving any attention from the physicians. Bicêtre was also used as a prison, and during the bloody massacres of Sept. 1792, it became the scene of the most horrible slaughter, the inmates defending themselves desperately against the revolutionary murderers. Subsequently it was used partly as a prison and partly as a hospital, but the former department having been transferred to a new building, in the rue de la Roquette, within Paris, Bicêtre is now employed exclusively as an asylum for indigent old men or invalids, and male lunatics. The principal buildings, forming a square of 900 feet on each side, are separated by 8 large courtyards. A new division, constructed in 1822, consists of 2 edifices, between which is a small garden for the use of the inmates. The establishment, from the elevation of its site, has purer air than any other hospital in Paris. The rules by which the patients are governed are as mild as good order permits, and improvements in their treatment are daily introduced. Those who are not entirely disabled by infirmities or old age are required to work 8 hours a day at their respective trades, and receive in return a share of the profits; the rest goes toward defraying the expenses of the hospital. The food is healthy and quite sufficient. The lunatics, about 900 in number, occupy a department by themselves. The gentlest treatment, except in extreme cases, is employed. To those who are capable of it, daily occupation is given on a model farm at a little distance. Others attend schools of various kinds in the establishment, and the directors constantly endeavor to find some manual or intellectual occupation for every one of them. This method has succeeded beyond all anticipation. The sociability of the lunatics has been also improved; but music, above all, has worked wonders. The majority of patients are fond of it, and some of them have become accomplished proficient, while all seem to feel its beneficial influence. Concerts are occasionally given, at which both the performers and the audience are lunatics. The establishment, with its dependencies, forms, as it were, a small town, the total population of which, patients, servants, officers, and physicians included, is not far from 5,000 souls. The neighboring village of the same name is insignificant.

**BICHANA**, a town of Abyssinia, in the state of Amhara, 160 miles S. S. E. of Gondar. It is a place of some importance, and the capital of

a chiefship, but the houses are mean and the wall dilapidated. It has a great weekly market.

**BICHAT, MARIE FRANÇOIS XAVIER**, a French anatomist and physiologist, born Nov. 11, 1771, at Thoirette-en-Bresse, department of the Ain, died at Paris, July 22, 1802, having already acquired great celebrity, though very young. He was the eldest son of Jean Baptiste Bichat, doctor of medicine of the university of Montpellier, and mayor of the small town of Poncin, where he practised medicine. Young Bichat received the rudiments of his education at Nantua. In 1788 he entered the seminary of St. Irénée, at Lyons; and as this school belonged to the Jesuits, and was under the direction of one of Bichat's uncles, a priest, he was driven from it by the revolution which broke out in 1789. His favorite studies were mathematics and physical science. On returning home he began the study of anatomy under his father, and afterward attended lectures at the hospital of Lyons. Driven a second time from Lyons by the events of the revolution, he went in 1793 to Paris, to study surgery under the celebrated Desault, at the Hôtel Dieu. Without a single acquaintance in Paris, he entered the school of Desault, and diligently followed the lectures of his master, by whom he was soon noticed for his zeal and ability. It was the practice of the school, that some chosen pupils should, each one in his turn, give an abstract of the lecture of the day, and at the close of the lecture on the following day this abstract was publicly read in the presence of the second surgeon of the hospital. On one occasion, the pupil whose turn it was to read an abstract of the lecture of the previous day, happened to be absent; Bichat stepped forward from the crowd of pupils, and offered to read his own, which had been made for private use. The offer was accepted, though the pupil was young, and had not been in the class more than a month. The abstract was clear, accurate, and full, and read with calmness and precision. On hearing of this from his colleague Manoury, Desault sent for Bichat, and from this first conversation, was so much interested in him that he invited him to reside in his own house; subsequently adopted him as his son, associated him in his labors, and destined him as his successor. Bichat continued to live with his master until the death of Desault, which happened about 2 years after their first acquaintance. After this event, Bichat arranged and published the works of his master, and opened a school for teaching anatomy, physiology, and surgery. Beside his public labors, he undertook a series of experiments on the chemical, physical, physiological, and vital properties of the different tissues of the animal economy. His labors were excessive and his constitution weak; his health gave way; lecturing fatigued him, and brought on a severe attack of bleeding of the lungs. During this first attack of illness, he passed the time in maturing his own particular views of anatomy and physiology, and sketched the plan

of the works in which these views were afterward developed. As soon as he had partially recovered from the attack, he recommenced his public labors and his private studies with the same intensity, relying on his youth and mental energy to support him in his imprudent course. Neither the entreaties of his friends nor the signs of returning disease could induce him to moderate his labor. In spite of increasing weakness, and hardly able to digest the simplest food, he continued to pass several hours a day in a damp cellar, macerating animal tissues and making various experiments to ascertain the properties of each particular kind of structure in the organs of the body. His powers at length became exhausted, but his mental energy was unabated. On one occasion he felt giddy on leaving the room where these experiments were made, and in the course of the day, while descending the stairs of the Hôtel Dieu, his foot slipped and he fell down, receiving a severe blow on the head from the fall. He was taken up insensible, and carried home; but the next day he returned to his duty, notwithstanding a severe headache. In a short time, however, he fainted from fatigue; symptoms of fever came on, which assumed a typhoid character, and proved fatal in the course of 14 days. And thus a man of genius of the highest order, from excessive love of study and continuous neglect of the physical requirements of health, fell a victim to his own imprudence, before he had attained to full maturity, for he died in the 82d year of his age. He had, however, done enough already to immortalize his name. He was the first who undertook a systematic analysis to reduce the complex structures of the body to their elementary tissues, and to ascertain the peculiar properties, chemical, physical, and vital, which characterize each simple tissue. The idea of such a work had been suggested by partial analysis before, but his *Anatomie générale* formed a new era in the development of that branch of science. The work abounds with minute and laborious research, extensive and elaborate experiment, conducted with intuitive insight and practical skill; and though a monument of fame, it was completed and published in a year. It was recognized at once, and universally, as the work of a great genius. Soon after the publication of this work, he commenced his *Anatomie descriptive*, conceived on a new plan and partly executed; but before it could be finished, Bichat died. His friends and disciples who had followed his labors and assisted in his numerous experiments, completed the unfinished volumes on the plan which he had traced himself and thoroughly explained to them; and though the work was partly written by his followers, it very properly bears his name. The works of Bichat are not standards of perfection at the present day; for the impulse which he gave to study, and the views which he developed in his analytical investigations, led to further observations and ex-

periments in the same direction, which he would have made himself, if he had lived to finish slowly that which he began so brilliantly and pushed so far, within a few short years. There was little systematic order in the study of anatomy and physiology, before his time. Dissections were made chiefly with a view to the practical art of surgery alone, and not with any comprehensive view of general analysis. He first laid stress on the general distinction between conscious and unconscious life in the body, and the correspondingly incessant action of one set of organs, sleeping or waking, contrasted with the interrupted action of another set of organs, which are active in the waking state and passive during sleep. The heart and lungs are always active night and day, while the muscles and the bones of the external frame are only active during portions of the day, and totally inactive during sleep. He divided the organism, therefore, into 2 distinct mechanisms, which he called the organic and relational, or the vegetative and the animal. These distinctions are admitted at the present day, although the vegetative or the organic mechanism is more commonly subdivided into the nutritive and the reproductive systems. Minute analysis has been carried very far in the direction which he indicated, but philosophical or systematic analysis, as he conceived it, has been almost totally neglected, or pursued without intuitive perception of its philosophical importance. He fell into some errors by generalizing too extensively, without a sufficient knowledge of minor facts, and these errors have deterred his followers from pursuing the same course. And yet the greatest work of progress remains still to be done in that direction. His *Recherches sur la vie et la mort* contains the germs of a revolution in the study of anatomy and physiology, but the defective definitions and manifest errors which it contains, have caused them to be overlooked. The same idea runs through all his works, and that is the distinction between conscious and unconscious bodily life and motion.

BICKERSTAFF, ISAAC, dramatist, born in Ireland, in 1788; the date of his death unknown. After having been one of the pages of Lord Chesterfield (viceroy of Ireland, 1745-'7), he received a commission in the marines, in which service he was lieutenant when compelled to retire with disgrace. He wrote 18 dramatic pieces, between 1756 and 1771, several of them of considerable merit and continued popularity. Those best known now are the comic operas of "Love in a Village," "Lionel and Clarissa," and "The Padlock," and the comedy of "The Hypocrite." This last is an alteration of Cibber's "Nonjuror" (itself only an adaptation of Molière's *Tartuffe*), scarcely any thing more than the character of Mawworm being written by Bickerstaff. The *Biographia Dramatica*, after relating that he fled from England, charged with a crime not to be named, says that in 1782 he was yet alive, in foreign exile, "poor and despised by all orders

of people." Before this he moved in high literary society in London, being intimate with Goldsmith, Garrick, Murphy, Boswell, Sir Joshua Reynolds, and Dr. Johnson. Mrs. Thrale relates that "when Mr. Bickerstaff's flight confirmed the report of his guilt, and Mr. Thrale said, in answer to Johnson's astonishment, that he had long been a suspected man, 'By those who look close to the ground dirt will be seen, sir,' was the lofty reply; 'I hope I see things from a greater distance.'"

**BICKERSTETH, EDWARD**, an English clergyman, born in Westmoreland, March 19, 1786, died Feb. 24, 1850. Educated in his native town, he was for several years a clerk in London, till in 1812 he began business as a solicitor in Norwich. His business was flourishing, when he became deeply interested in the religious and benevolent movements of which Norwich was the centre, and in 1815 he was ordained a deacon in the Anglican church. He departed the next year to Africa to inspect and organize the stations of the church missionary society in that country, and during the next 15 years he was the secretary and the chief acting officer of that society. In 1830 he resigned his office, and became rector of Walton, in Hertfordshire, where he spent the remainder of his life. He was prominent in the anniversary meetings of religious societies, and especially advocated, both by his addresses and his pen, the interests of missions. His publications are numerous, consisting chiefly of exegetical and devotional treatises, and sermons.—**HENEY, LORD LANGDALE**, brother of the preceding, an English lawyer and statesman, born in Westmoreland, June 18, 1783, died at Tunbridge Wells, April 18, 1851. He served an apprenticeship to his father, who was a surgeon and apothecary, after which he travelled on the continent as medical attendant to the earl of Oxford, whose daughter he subsequently married. He graduated at Caius college, Cambridge, in 1808, was admitted to the bar in 1811, distinguished himself by his assiduous attention to professional duties, and rose to eminence in the equity courts, to which he confined his practice. He became a bencher of the Inner Temple in 1827, in 1835 declined the offer made to him by Sir Robert Peel of a seat on the bench, and in 1836 was elevated to the peerage as Lord Langdale, and created a privy councillor. In this office he cherished his taste for literature, and was honored for his adherence to the highest principles of action.

**BICKLEIGH**, a parish of Devonshire, England, 8 miles S. W. of Tiverton, at the confluence of the Exe and Dart rivers. Bamfylde Moore Carew, who became "the king of the gypsies" was born here in 1698.

**BIDASSOA**, a small river of the Basque provinces of Spain, noted for the battles fought upon its banks, between the French under Soult and the English, Spaniards, and Portuguese, under Wellington. After the defeat of Vittoria in 1813, Soult collected his troops in a position, the right of which rested on the sea opposite

Fuenterrabia, having the Bidassoa in front, while the centre and left extended across several ridges of hills toward St. Jean de Luz. From this position he once attempted to relieve the blockaded garrison of Pampeluna, but was repulsed. San Sebastian, besieged by Wellington, was now hard pressed, and Soult resolved to raise the siege. From his position of the lower Bidassoa it was but 9 miles to Oyarzun, a village on the road to San Sebastian; and if he could reach that village the siege must be raised. Accordingly, toward the end of Aug. 1813, he concentrated 2 columns on the Bidassoa. The one on the left, under Gen. Clausel, consisting of 20,000 men and 29 guns, took a position on a ridge of hills opposite Vera (a place beyond which the upper course of the river was in the hands of the allies), while Gen. Reille with 18,000 men, and a reserve of 7,000 under Foy, took his station lower down, near the road from Bayonne to Irun. The French intrenched camp to the rear was held by D'Erlon with 2 divisions, to ward off any turning movement of the allied right. Wellington had been informed of Soult's plan, and had taken every precaution. The extreme left of his position, sheltered in front by the tidal estuary of the Bidassoa, was well intrenched, though but slightly occupied; the centre, formed by the extremely strong and rugged ridges of San Marcial, was strengthened with field-works, and held by Freyre's Spaniards, the 1st British division standing as a reserve on their left rear near the Irun road. The right wing, on the rocky descents of the Peña de Haya mountain, was held by Longa's Spaniards and the 4th Anglo-Portuguese division; Inglis's brigade of the 7th division connecting it with the light division at Vera, and with the troops detached still further to the right among the hills. Soult's plan was, that Reille should take San Marcial (which he intended forming into a bridge-head for ulterior operations), and drive the allies toward their right, into the ravines of Peña de Haya, thus clearing the high road for Foy, who was to advance along it straight on Oyarzun, while Clausel, after leaving a division to observe Vera, should pass the Bidassoa a little below that place, and drive whatever troops opposed him up the Peña de Haya, thus seconding and flanking Reille's attack. On the morning of Aug. 31, Reille's troops forded the river in several columns, carried the first ridge of San Marcial with a rush, and advanced toward the higher and commanding ridges of that group of hills. But in this difficult ground his troops, imperfectly managed, got into disorder; skirmishers and supports became mingled, and in some places crowded together in disordered groups, when the Spanish columns rushed down the hill and drove them back to the river. A second attack was at first more successful, and brought the French up to the Spanish position; but then its force was spent, and another advance of the Spaniards drove them back into the

Bidassoa in great disorder. Soult having learned in the mean time that Clausel had made good his attack, slowly conquering ground on Peña de Haya, and driving Portuguese, Spaniards, and British before him, was just forming columns out of Reille's reserves and Foy's troops for a third and final attack, when news came that D'Erlon had been attacked in his camp by strong forces. Wellington, as soon as the concentration of the French on the lower Bidassoa left no longer any doubt of the real point of attack, had ordered all troops in the hills on his extreme right to attack whatever was before them. This attack, though repulsed, was very serious, and might possibly be renewed. At the same time, a portion of the British light division was drawn up on the left bank of the Bidassoa so as to flank Clausel's advance. Soult now gave up the intended attack, and drew Reille's troops back across the Bidassoa. Those of Clausel were not extricated till late in the night, and after a severe struggle to force the bridge at Vera, the fords having become impassable by a heavy fall of rain on the same day, the allies took San Sebastian, except the citadel, by storm, and this latter post surrendered on Sept. 9.—The second battle of the Bidassoa took place Oct. 7, when Wellington forced the passage of that river. Soult's position was about the same as before; Foy held the intrenched camp of St. Jean de Luz, D'Erlon held Urdax and the camp of Ainhoa, Clausel was posted on a ridge connecting Urdax with the lower Bidassoa, and Reille stood along that river from Clausel's right down to the sea. The whole front was intrenched, and the French were still employed in strengthening their works. The British right stood opposed to Foy and D'Erlon; the centre, composed of Giron's Spaniards and the light division, with Longa's Spaniards and the 4th division in reserve, in all 20,000 men, faced Clausel; while on the lower Bidassoa Freyre's Spaniards, the 1st and 5th Anglo-Portuguese divisions, and the unattached brigade of Aylmer and Wilson, in all 24,000 men, were ready to attack Reille. Wellington prepared every thing for a surprise. His troops were drawn up well sheltered from the view of the enemy during the night before Oct. 7, and the tents of his camp were not struck. Beside, he had been informed by smugglers of the locality of 3 fords in the tidal estuary of the Bidassoa, all passable at low water, and unknown to the French, who considered themselves perfectly safe on that side. On the morning of the 7th, while the French reserves were encamped far to the rear, and of the one division placed in 1st line many men were told off to work at the redoubts, the 5th British division and Aylmer's brigade forded the tidal estuary, and marched toward the intrenched camp called the Sansonlottes. As soon as they had passed to the other side, the guns from San Marcial opened, and 5 more columns advanced to ford the river. They had formed on the right bank before the French could offer

any resistance; in fact, the surprise completely succeeded; the French battalions, as they arrived singly and irregularly, were defeated, and the whole line, including the key of the position, the hill of Croix des Bouquets, was taken before any reserves could arrive. The camp of Biriatu and Bildox, connecting Reille with Clausel, was turned by Freyre's taking the Mandale hill, and abandoned. Reille's troops retreated in disorder until they were stopped at Urogne by Soult, who arrived in haste with the reserves from Espelette. While still there, he was informed of an attack on Urdax; but he was not a moment in doubt about the real point of attack, and marched on the lower Bidassoa, where he arrived too late to restore the battle. The British centre, in the mean time, had attacked Clausel, and gradually forced his positions by both front and flank attacks. Toward evening he was confined to the highest point of the ridge, the Grande Rhune, and that hill he abandoned next day. The loss of the French was about 1,400, that of the allies about 1,600 killed and wounded. The surprise was so well managed that the real defence of the French positions had to be made by 10,000 men only, who, on being vigorously attacked by 83,000 allies, were driven from them before any reserves could come to their support.

BIDDEFORD, a thriving manufacturing and commercial city in York co., Me., on the Saco river, at the falls, 6 miles from its mouth. On the opposite bank is the town of Saco, engaged in similar occupations, and connected with it by a bridge 500 feet long. The water-power is excellent and inexhaustible, the fall being 42 feet. In 1855, 10 cotton mills were worked by it—5 on each side of the river—containing in all about 60,000 spindles and 8,000 looms. Beside these cotton mills, chiefly owned by foreign capitalists, there are extensive manufacturing of woollen goods, hardware, &c. In one iron foundry 1,000 tons of pig iron are consumed annually. About 5,000,000 feet of lumber are annually sawed out here into boards, planks, laths, shingles, &c. It is also a considerable lumber market from mills further up the river. Owing to the narrowness and crookedness of the river, and its swift currents below the falls, navigation is not very extensively carried on. In 1854, 2,582 tons of shipping were registered, and 2,462 licensed. There are 4 banks, and insurance, gas, and savings bank companies; 8 libraries, with an aggregate of 7,000 vols.; 2 newspapers, and an academy. The schools are very good, and \$6,000 are annually expended upon them. Much attention is paid to agriculture, and there are large fruit nurseries. The Portland, Saco, and Portsmouth railroad, passing through the town, connects it with Portland and Boston. The "Pool," near the mouth of the river, is a place of summer resort. A fine beach several miles in extent is there found. Biddeford was incorporated as a city in 1854. Its population in 1840 was 2,574; 1850, 6,095; 1857, about 12,000.

BIDDLE, CLEMENT, a colonel in the revolutionary army, born in Philadelphia, May 10, 1740, died there July 14, 1814. Descended from one of the early Quaker settlers and proprietaries of western New Jersey, he retained his connection with the society of Friends until the commencement of the war of independence. In early life he engaged in commercial pursuits in his native city; but notwithstanding this and the discipline of the religious society in whose tenets he had been educated, he united in 1764 with a number of Quaker friends in forming a military corps for the protection of a party of friendly Indians who had sought refuge in Philadelphia from the fury of a band of lawless zealots known as the Paxton boys, who had recently massacred some unoffending Conestoga Indians at the interior town of Lancaster. These banditti, powerful in numbers, had advanced within 5 or 6 miles of the city, threatening destruction to all who should oppose them, when the vigor of the military preparations checked their further progress. Scarcely had this local disturbance been quieted when news was received of the resolution of the British house of commons to charge certain stamp duties in the colonies. The feeling engendered throughout the whole country by this step was nowhere deeper than in Philadelphia; and the consummation of the resolve of the commons by the subsequent passage of the stamp act, induced, in that city, the celebrated non-importation resolutions of Oct. 25, 1765, one of the most decided measures adopted during the early part of the struggle with Great Britain, for the preservation of the civil rights of the colonists. To this agreement the names of the principal merchants of the city were attached, and among the number those of Col. Biddle and his brother Owen Biddle. The course subsequently pursued by the British ministry destroying all hope of a reasonable adjustment of the differences, Col. Biddle embarked early and zealously in the defence of the liberties of America, and by his active exertions was greatly instrumental in forming the "Quaker" company of volunteers raised in Philadelphia in 1775, of which he was elected an officer before the corps joined the army. Congress having, in June, 1776, for the protection of the middle colonies, directed the immediate establishment of a flying camp of 10,000 men to be furnished by Pennsylvania, Maryland, and Delaware, on July 8 following elected Col. Biddle its deputy quartermaster-general, as well as for the militia of Pennsylvania and New Jersey, ordered to rendezvous at Trenton. Col. Biddle took part in the important battle of Trenton at the close of the same year, and, in conjunction with another officer, was ordered by Washington to receive the swords of the Hessian officers. In the stoutly contested victory of Princeton, the surprise and retreat at Brandywine, the well-concerted but unsuccessful enterprise of Germantown, he was also engaged; and during the winter of

1777-'78, shared the sufferings of the American army at the memorable cantonment of Valley Forge. As commissary-general of forage, under Gen. Greene, he rendered important service to the army in several critical junctures, especially during the famine at Valley Forge. At Monmouth he shared the success of his countrymen. From the time of his entering the service he was actively and usefully engaged until Sept. 1780, when, unable longer to yield to the friendly solicitations of Washington and Greene, owing to the pressure of his private affairs, he was compelled to return to private life. His military career, however, was briefly renewed in the capacity of quartermaster-general of Pennsylvania (an appointment received by him from his native state in Sept. 1781), in the expedition under Washington, in 1794, against the whiskey insurgents of that state. Col. Biddle labored earnestly also in the early political movements of the patriot party of his state, advocating effectively the revolutionary state constitution of 1776 (which his brother Owen Biddle had had, as a member of the convention, a share in framing), as a measure calculated to promote the best interests of Pennsylvania. The triumph of the constitutional party, after encountering protracted and bitter opposition in the city of Philadelphia, is known. A declaration or bill of rights as a constituent part of the organic instrument of federal union, to prevent abuse or misconstruction of its powers, not only met with his approval but enlisted his active support. After the organization of the federal government under the constitution of 1787, Col. Biddle was appointed marshal of Pennsylvania, as an evidence of the regard in which he was held by Washington. This regard, which he had early acquired, was maintained and even increased by frequent intercourse and constant epistolary correspondence, as the letters of Washington written to him until within a few weeks of the general's death abundantly show. Greene and Knox were also his warm personal friends and correspondents, and when the former was selected for the command of the army in the southern states, he tendered to and urged upon Col. Biddle the post of quartermaster-general. As a private citizen he merited and enjoyed during his life the confidence and respect of the community in which he lived.

BIDDLE, CLEMENT CORNELL, LL. D., 5th son of the preceding, born at Philadelphia, Oct. 24, 1784, died Aug. 21, 1855. At the commencement of the present century he entered the naval service of the United States, in which he remained for a brief period, and afterward applied himself to the study of the law. Shortly after his admission to the bar his patriotic feelings were roused by the outrage upon the U. S. ship *Chesapeake* in the month of June, 1807, and in the expectation of a war he applied to Jefferson for service in the army. He received an appointment

as captain of dragoons, and was stationed with his regiment for some time at New Orleans. But the British government having, after a tedious negotiation, disavowed the act of the commander of the Leopard, and peaceful relations between the countries being restored, he resigned his commission. However, subsequent aggressions by the British, both by their doctrine and system of blockade and their orders in council, at length led to the declaration of war, June 18, 1812. Scarcely had the proclamation been made when Capt. Biddle raised in his native city a company of volunteers, called the "State Fencibles," and was elected to the command of it in July, 1812. Upon the organization of the 1st regiment of Pennsylvania volunteer infantry, which was mustered into the U.S. service, he was elected its colonel and served as such during the war. The retreat of the British from Baltimore left no opportunity for active service to his command, which during the autumn of 1814 had, with other regiments, been stationed at Camp Dupont in the state of Delaware. On his retirement from military life, at the conclusion of the war, he devoted his leisure to the investigation and study of philosophical subjects in the broad domain of ethics and metaphysics, and also to the principles governing the production, distribution, and consumption of wealth. To the science of political economy especially did he address himself, and his writings have in a great measure been instrumental in popularizing its study. The many editions of the translation of Say's "Treatise on Political Economy," with the notes and additions of Mr. Biddle, alone afford ample evidence of the fact. In the free trade convention, in Philadelphia, in Sept. 1831, he bore a prominent part; and, although occupying no public position, also contributed to mould the policy of the federal government with regard to the currency, as well as to its commercial intercourse with foreign nations.

BIDDLE, JOHN, "the father of English Unitarians," born at Wotton-under-Edge, in Gloucestershire, in 1615, where his father was a woollen draper, died Sept. 22, 1662. He graduated at Oxford, and was elected master of the free school of Gloucester. In the mean time he had been studying theology with great ardor, and printed for private circulation a small tract entitled, "Twelve Arguments drawn out of the Scripture, wherein the commonly received opinion touching the Deity of the Holy Spirit is clearly and fully refuted." In his conversation he was equally outspoken, and the cry of heresy was raised against him. He was dismissed from his situation, and thrown into the county jail, Dec. 2, 1645. To the magistrates he delivered a confession of faith, from which it is evident that his mind was then in a state of doubt between Trinitarianism and Unitarianism. Six months afterward, Archbishop Usher had a conference with him, but in vain. The long parliament summoned him to Westminster, and appointed a committee to sit upon his case. Being arraigned on the charge of heretical opin-

ions concerning the Holy Spirit, he refused to answer all such questions as were designed to entrap him into a confession of faith concerning the nature of Jesus Christ. He was kept in suspense for 18 months, when a letter addressed by him to Sir Harry Vane had the desired effect of bringing about a decision. He was committed to the custody of one of the officers of the house of commons, and remained in confinement for 5 years. The assembly of divines at Westminster examined him, the result of which was to strengthen him in his opinions. He now published his tract, hitherto privately circulated. It created much scandal, and was ordered to be burnt by the common hangman, which only increased its sale. While yet in prison, he printed a "Confession of Faith concerning the Holy Trinity according to the Scriptures, with the Testimonies of several of the Fathers on this head" (London, 1648). This was followed by "The Testimonies of Irenæus, Justin Martyr, Novatianus, Theophilus (who lived the 2 first centuries after Christ was born, or thereabouts), as also Arnobius, Lactantius, Eusebius, and Hilary, concerning that one God and the persons of Holy Trinity." The Presbyterians, then dominant in church and state, passed a measure through parliament, by which every one who denied the doctrine of the Trinity should be punished with death. This was aimed at Biddle, and he was about to suffer, when a sudden opposition arose to it among the Independents and the army. The ordinance was therefore suffered to lie in abeyance. When the Independents gained the upper hand (1649), the penal laws against heretics were mitigated or repealed. Biddle was released, and retired into Staffordshire, where he was warmly welcomed by a magistrate, who procured him a congregation, made him a private chaplain, and left him a legacy. Bradshaw, president of the council, however, remanded him to prison. He had now lost not only his fortune and his liberty, but his friends. Dr. Gunning, afterward bishop of Ely, was the only theologian who visited him in prison. He suffered great privations, but his accurate knowledge of the Greek Scriptures, which he knew by heart, induced Roger Daniel, a London printer, to give him for correction the proof-sheets of a Greek Septuagint, and this relieved his wants. In 1651, an act of indemnity and oblivion for all heretical offences was passed by parliament, and Biddle was again released, and collected around him those whom his writings had brought to his way of thinking. Their fundamental law was that "the unity of God is a unity of person as well as nature." The members of this new sect were called Bidelians, and, when their harmony with the doctrines of Socinus was perceived, Socinians. A translation of Biddle's "Twofold Scripture Catechisms" for the use of foreigners, again got him into trouble. He was summoned to the bar of the house of commons, and on his refusal to criminate himself, was committed for contempt, and the death-penalty

ordinance was revived against him. When Cromwell dissolved the parliament, Biddle was again set free after a 10 months' term. A whole Baptist congregation became converted to Biddle's views, and this was so displeasing to the Baptist minister, Mr. Griffin, that he challenged Biddle to a public controversy. Biddle imprudently accepted the challenge, and spoke in a derogatory manner of Christ's divine nature. He was thrown into the Poultry Compter, July 8, 1655, and thence removed to Newgate, and tried for his life on the long parliament ordinance against blasphemy and heresy. As the trial was evidently going against him, Cromwell interposed, the trial was stopped, and Biddle was remanded to jail. In order to shelter Biddle yet more securely from his persecutors, Cromwell banished him to Star castle, in St. Mary's, one of the Scilly islands, with an annual subsistence of 100 crowns (Oct. 1655). Here he continued to devote himself to the study of theology. After 3 years, he was released on a writ of *habeas corpus*, and returning to London, became pastor of an Independent congregation, but fearing the Presbyterians, who came again into power after the death of Cromwell, he retired into the country. Upon the final dissolution of the rump parliament, he came to London again and renewed his ministrations. The restoration of Charles II. in the summer of 1660, again caused him to retire from publicity. His caution did not preserve him long. His little congregation was surprised June 1, 1662, when holding a convective in the house of a London citizen. Biddle was fined £100, and each of the audience £20, with confinement in default of payment. The prison was kept in such a manner that 5 weeks' residence in it was enough to cause his death. In 1658 he published several small pieces, translated from the works of the Polish Unitarians, among which was Przypocovius's "Life of Faustus Socinus," also, "Notes on the Revelations." He was admitted, by foes as well as friends, to be irreproachable, except for his opinions. He denied the doctrine of original sin and the atonement. Joshua Toulmin, a modern English Unitarian minister, has written a "Review of the Life, Character, and Writings of John Biddle," in the spirit of an admirer.

BIDDLE, NICHOLAS, a distinguished naval commander of the revolution, born in Philadelphia, Sept. 10, 1750, was killed at sea in the 28th year of his age by an explosion of the magazine of his vessel, March 7, 1778. In 1765, while on a voyage to the West Indies, he with 2 others, chosen by lot, were left for 2 months on an uninhabited island, he being at that time but 15 years of age. In 1770 he entered the British navy. When Phipps, afterward Lord Mulgrave, was about to start on his exploring expedition, young Biddle, though a midshipman, deserted his own vessel and shipped as a seaman on the *Carcass*, serving through the cruise with Lord Nelson, who was a mate of Phipps's vessel. On the commencement of the

American revolution he came to America and was made captain of the *Andrew Doria*, a brig of 14 guns and 180 men, in which he participated in Commodore Hopkins's attack on New Providence. After refitting in New London he was ordered on a cruise to the banks of Newfoundland, and in 1776 was fortunate enough to take among other prizes 2 transport ships with valuable cargoes and with a battalion of Highland troops. He was appointed to the command of the *Randolph*, a 32 gun frigate, in Feb. 1777. In March, 1778, he was wounded in an action with the *Yarmouth*, an English 64 gun ship. While under the hands of a surgeon, the magazine blew up, and the whole crew of the *Randolph* were lost, except 4 men, who were tossed about on a piece of the wreck for 4 days before they were relieved. The other vessels of the squadron escaped in consequence of the disabled state of the *Yarmouth*.

BIDDLE, NICHOLAS, an American financier, born at Philadelphia, Jan. 8, 1786, died Feb. 27, 1844. His father, Charles Biddle, was a patriot of the revolution, and vice-president of Pennsylvania, when Benjamin Franklin was the president, under the former constitution of that state; the son was named after his uncle Commodore Nicholas Biddle, the subject of the preceding article. Graduating with the highest honors at Princeton college in 1801, Biddle then pursued the usual course of study for the bar, but being too young for admission to it, he went to Europe as secretary to Gen. Armstrong, U. S. minister to France, and afterward held the same position with Mr. Monroe, U. S. minister to England. He traveled extensively in Europe, and to his attainments in classical learning added a very thorough knowledge of the modern languages; indeed, his devotion to liberal studies was constant through life. In 1807 he returned to Philadelphia, and commenced the practice of the law. He also edited the "Port Folio," for a time in conjunction with Joseph Dennie, compiled a "Commercial Digest," and prepared the narrative of "Lewis and Clark's Explorations." He was in the house of representatives of Pennsylvania in 1810, and was distinguished by his efforts to establish a general system of education. During the war of 1812-'15, he was in the state senate, and ardently supported the measures for carrying on the contest; in 1814 he wrote the report of the senate committee upon the propositions from the Hartford convention,—an able and patriotic state paper, that attracted great attention. In 1817 he was the candidate of the democratic party for congress, but was defeated by the federalists. In 1819, President Monroe appointed him a government director of the U. S. Bank. In 1823, on the resignation of Mr. Langdon Cheves, he was elected president of that institution, and administered its affairs with consummate ability. During the presidency of Gen. Jackson, the recharter of the bank became the leading political question of the day. The controversy was one of great violence; a

bill for the recharter was passed by congress, but vetoed by the president. By the limitation of its charter, the bank terminated its existence in 1836, retaining to the last its stability and character. The success of the national bank induced the legislature of Pennsylvania to create "a state bank to be called the United States Bank." Nicholas Biddle, then at the height of his reputation as a financier, was urgently solicited to accept the presidency of the new institution. He consented—with reluctance, it is stated—and continued at its head till March, 1839, when, his health being much impaired, he resigned, leaving the bank, apparently, in a prosperous condition. Two years afterward, the bank finally ceased payment, and was declared to be insolvent. Whether this was the result of measures pursued during the administration of Mr. Biddle, or after it, or of general causes affecting the financial condition of the whole country, or of difficulties inherent to the working of the state institution, were points of vehement controversy, which our limits do not permit us to review. Mr. Biddle published a series of letters in vindication of his administration of the state bank. There is an extended biography of him, by a distinguished citizen of Pennsylvania, in the "National Portrait Gallery" (edition of 1854). From political opponents on the bank question, his character has also won some high eulogiums. The Hon. W. F. Packer (now governor of Pennsylvania), in advocating a railroad connection of Philadelphia with the lakes, said: "This was the favorite project of the late Nicholas Biddle; and whatever may be said of him as a politician or a financier, all agree that on questions of internal improvement and commerce he was one of the most sagacious and far-seeing statesmen of this union." The Hon. C. J. Ingersoll, in his history, says: "Nicholas Biddle was as iron-nerved a man as his great antagonist Andrew Jackson, loved his country not less, and money as little." He was an earnest promoter of many great public improvements, and a member of numerous associations for beneficial purposes, in which he exercised, by his popular manners and force of character, a commanding influence. As president of the trustees of the Girard college, he determined the plan of the building in accordance with his own classic taste, to which Philadelphia owes, also, the beautiful structure the U. S. custom house, formerly the U. S. bank. His speeches, essays, and letters, exhibit an unusual combination of elegance with vigor of style. In 1811 he married Miss Craig, of Philadelphia, who had inherited an extensive country seat called "Andalusia," on the river Delaware. There Mr. Biddle indulged his predilection for agriculture, which, with literature, formed the relaxation of his laborious life. He was for many years the president of the agricultural and the horticultural societies of Pennsylvania, and delivered before them several addresses.

BIDDLE, RICHARD, brother of the preceding,

and, like him, an accomplished scholar, born in Philadelphia, March 25, 1796, died at Pittsburg, Penn., July 6, 1847. He shared the military ardor of his family, which has furnished several gallant officers to the army and to the navy, and though a mere youth in 1813, he was in arms at Shilpot, and in the following year at Camp Dupont, in the force raised to protect Philadelphia from the expected advance of the British army. He studied the law, and then removing to Pittsburg, he soon became an acknowledged leader of the bar. In 1827 he visited England; a book of travels in America, by Capt. Basil Hall, appearing about that time, an exposure of its errors was made by Mr. Biddle, in a publication that exhibited his remarkable vigor of mind and accuracy in details. These qualities were more highly tasked in his "Life of Sebastian Cabot," which brought to light, from recondite sources, new and important information upon the history of maritime discoveries in America. Some of the original opinions maintained in this work have been contested by subsequent writers, but the great ability displayed in it has never been denied. With these investigations he occupied his time for about 3 years in Europe, and on his return home resumed the practice of the law. In 1837 he was elected to Congress, from which he retired in 1840. His course in that body was marked by a determined resistance to extremes of opinion or policy, from either section of the Union.

BIDDOOMAHS, or BUDDUMA, a piratical tribe who inhabit the islands of Lake Tchad, the recently explored inland sea of central Africa. They neither sow, plant, nor rear cattle, but maintain themselves by fishing and plunder. They own nearly 1,000 barks, and have made themselves complete masters of the lake and its borders. Some of these men, whom Major Denham saw at Bornoo, struck him as the wildest and ugliest specimens of humanity he had ever seen. They are pagans, and have maintained their independence of the Mohammedans living around them, and with whom they are constantly at war. They were visited by Dr. Overweg in 1851 and '52. Dr. Barth, who visited them after Overweg's death, informs us that they call themselves Yedina, and that Biddoomah is the title given to them by their neighbors. They are jet black. Their largest boats are 40 feet in length and 6½ in width. These boats are called *makara*, made of light wood. They are without sails and propelled by long poles. The ribs of the boat are fastened together with ropes, the holes being stopped with bast. Dr. Barth says they belong to the Koto-ko, and are nearly related to the people of Nghala. Their language was originally distinct from the Kanuri, although in process of time they have adopted many of their terms.

BIDLOO, GODFREY, a Dutch surgeon and anatomist, born at Amsterdam, March 12, 1649, died at Leyden, April, 1718. His parents were Anabaptists, and in compliance with

their wishes he devoted himself to the study of anatomy. In 1688 he was appointed professor of anatomy at the Hague. In 1694 he became professor of anatomy and surgery at Leyden, and about the same time physician to William III. of England; on the death of whom, in 1702, Bidloo returned to his professorship at Leyden. He published *Anatomia Humani Corporis*, folio, Amst., 1685, comprised in 105 finely drawn plates. This work was incorrect in many respects, but it was, notwithstanding, one of the best of the kind then existing. Oowper, a surgeon of London, is said to have appropriated the plates, and having altered them and made some slight additions, published them as his own.

BIDPAY, or PIRPAR, an Indian Bramin and gymnosophist, who is supposed by some to have lived 2,000 years and by others 800 years before the Christian era, and of whose life nothing is known except that he was governor of a part of Hindostan. His name is attached to a collection of ingenious fables which have been spread throughout the East and the West, and are regarded as a summary of all practical wisdom. They were originally written in Sanscrit, under the titles of *Pancha Tantra* and *Hitopadesa*, and after having been translated into Arabic and Hebrew, a Latin version of them was made in 1262 by Giovanni da Capua, under the title of *Directorium vite, parabola antiquorum sapientium*. The *Hitopadesa* was edited by Schlegel, and published at Bonn in 1829; the Arabic text was published at Paris, by Sylvestre de Sacy, in 1816; and the fables have been translated into almost all languages. Eighteen of the fables of La Fontaine are copies or close imitations of them. Recent savants are of opinion that the author of the fables of Bidpay was a Bramin named Vichnu Parma.

BIEDERMANN, FRIEDRICH KARL, a professor of philosophy and public law at the university of Leipsic, born in that city, Sept. 25, 1812. In 1845, his lectures at the university were suspended on account of his liberal sentiments; subsequently he was reinstated in his position. Since 1850 he has been engaged upon a publication of a new encyclopedical work, to be called *Germania*. His "Lectures on Socialism," and a work on German philosophy, from Kant to our day, are worthy of mention.

BIELA, WILHELM VON, baron, born at Roela, Prussia, March 19, 1782, died at Venice, Feb. 18, 1856, an Austrian officer, who has rendered his name immortal by discovering an interesting comet, Feb. 27, 1826, while stationed at Josephstadt, in Bohemia.

BIELEFELD, a circle of Prussia, in the province of Westphalia; pop. 47,739. The Teutoburger Wald range of mountains runs through the circle. It produces fine flax and hemp, but little timber and grain. Linen yarn, ironware, tobacco, woollens, leather, soap, copper and copper ware, yarns, and damask cloth, are among the manufactures.—The capital of the circle is of the same name; pop. 10,808. It has

an old fortress, now used as a prison; it is surrounded by ramparts and a broad ditch which have been laid out in beautiful walks. The Cologne and Minden railway passes through the town.

BIELEV, or BIELEF, a town of Russia, in the government of Tula, situated on the river Oka, 64 miles S. W. of the town of Tula; pop. 7,000. It has a considerable trade, and manufactures of soap, leather, and hardware.

BIELGOROD, a town of Russia, in the government of Koorak, and 73 miles S. of the town of Koorak, on the river Donets; pop. 10,818. It contains 13 churches, and 8 monasteries.

BIELITZ, a duchy of Austrian Silesia, between the Vistula and the Biala. It was a minor sovereignty until it came into the possession of the princes of Sulkoffsky in the year 1752, when Francis I., emperor of Germany, erected it into a dukedom. One-half of its 12,000 inhabitants are Protestants and the other half Catholics.—The capital of the duchy of the same name, pop. 5,500, has an old castle, a fine park, 8 churches, 2 Catholic and 1 Lutheran; is the seat of the superintendent of the Protestants of Moravia. It has considerable woollen, cassimere, and linen manufactories.

BIELLA, a province of Piedmont, which makes part of the intendency of Turin; pop. 94,528. It is traversed by a branch of the Apennines. The principal products are cattle, iron, copper, corn, rice, hemp, and silk-worms. The fields are irrigated by canals.—The chief town of the province, also named Biella, is a bishop's see, and has a royal college, a cloth factory, and trades in silk, oil, and chestnuts; pop. 8,250.

BIELO-OZERO, a lake of Russia, in the government of Novgorod, in lat. 60° 10' N., long. 87° 30' E. Length, 25 miles; breadth, 20 miles. The Sheksna, a branch of the Volga, forms its outlet, and canals connect it with the Onega, Sookhona, and Dwina.

BIELSKI, MASON, a Polish historian, born in 1495, died in 1575, at Biala, in the district of Sieradz. His *Kronika swiata* and *Kronika Polska* (Cracow, 1550 and 1564), contain the first comprehensive attempt at a history of Poland. He wrote 2 satirical poems, *Sen majowy* (Cracow, 1590), and *Sejm niewiasty* (1595), picturing, in the one, the degradation of Hungary, and calling upon his countrymen to exhibit a nobler spirit than the Hungarians, while the other gives a keen analysis of the condition of Poland in his days. A strategetical work of his, *Sprawa rycerska* (1569), gives valuable information upon the condition of the Polish army, and the character of Polish tactics. After serving in the army, and taking part, in 1581, in the battle of Obertyn, he devoted himself, for the rest of his days, to literary pursuits. In 1617 the bishop of Cracow stopped the circulation of his "Chronicles," as they were suspected to contain heterodox sentiments.

BIENNE, or BIEL, a lake and town of Switzerland, in the canton of Bern. The lake, which lies 8 miles N. E. of that of Neuf-

châtel, is 10 miles in length, and from 1 to 8 in breadth. It is an expansion of the river Thiele, and chiefly interesting from its containing the island of St. Pierre, where Rousseau resided in 1765. The town, situated at the north end of the lake, 17 miles N. W. of the town of Bern, is surrounded by old walls, has a high school, and several mills. Watchmaking is extensively carried on. Pop. 4,248, chiefly Protestants.

**BIENNIALS**, a technical term in botany, applied to plants which attain their full period of growth, reproduce their seed, and die within 2 years. Parsley, foxglove, and many other herbaceous plants, come under this denomination, as they attain their growth during the first year, flower and run to seed the second, and then die. In botanical works, biennial plants are designated by the astronomical sign of the planet Mars ( $\text{\textcircled{♂}}$ ), which performs its revolution around the sun in 2 years.

**BIENVILLE**, a parish in the N. W. part of Louisiana, bounded on the W. by Lake Bistincan, which communicates with Red river by an outlet, and is navigable by steamboats. The parish was set off from Claiborne parish in 1846. Its surface is thickly wooded, covered with occasional plantations of cotton and maize. It is traversed by Black Lake and Saline bayous. In 1855 the productions were 6,659 bales of cotton, and 221,225 bushels of Indian corn; the value of real estate was \$830,770; and the pop. 8,168, of whom 8,699 were slaves. Capital, Sparta.

**BIERNAOKI**, ALOYS PROSPER, a Polish agricultural reformer, born in 1778, in the palatinate of Kalish, of one of the most ancient noble families of Poland, died at Paris in 1856. He finished his studies at the university of Frankfurt-on-the-Oder, where he developed a taste for ceaseless intellectual activity, in respect of which he was prominent among his compatriots during a long and agitated life. After leaving the university he travelled in Germany, perfecting his knowledge of scientific agriculture, which at that time lay in the most forlorn and desolate state in Poland, an essentially agricultural country. Biernacki devoted his abilities, energy, and fortune to the difficult task of enlightening his countrymen, and making them familiar with new inventions and methods. He had not only to contend against the routine of prejudices, but to meet the equal ignorance of nobles and peasants. He established on his estates a school of mutual instruction on the Lancasterian method. He improved the breed of sheep by introducing in Poland merinos, which now equal, if they do not surpass, those of Spain. To Biernacki's indefatigable exertions Poland is greatly indebted for having improved and developed the resources of her soil. His estate, Sulislawice, near Kalish, was the earliest model-farm in Poland, established at his own cost, long before any other nobleman or the government had thought of such an institution. Having embraced constitutional ideas in politics, after the model of the

celebrated French constitutional opposition to the older Bourbons, Biernacki was for 10 years one of the leaders of a similar opposition in Poland. At the revolution of 1830 he was a member of the Polish diet, and zealous for employing decided and energetic measures. During the war he was secretary of finance. After the suppression of the revolution he emigrated to Paris, where he lived in studious occupation till his death.—Jozef, a soldier, and elder brother of the foregoing, also of high mental accomplishments, a fervent and devoted patriot, fought in Italy under Moreau, Scherer, and Macdonald, against the Austrians and Russians; and after participating in the Polish revolution of 1830, and in the partial movements which followed it, he died in 1836, a state prisoner in one of the Russian fortresses.

**BIERVLIET**, a town of Holland, in the province of Zealand, 18 miles E. N. E. of Sluis. It is the birthplace of William Beukels, who invented the process of curing herrings, and contains a monument to his memory, erected by Charles V.

**BIG BLACK RIVER**, a river about 200 miles in length, having its sources in Choctaw co., Miss., and taking a south-westerly direction, enters the Mississippi through 2 mouths, one of which is in Warren county, and the other in Claiborne, at Grand Gulf. It is bordered throughout most of its course by rich cotton plantations.

**BIG BONE LICK**, a salt spring in Boone co., Ky., especially interesting to geologists, and naturalists, on account of the deposits of fossil bones of the mastodon, and several species of mammalia found in the soil. The soil containing the deposit is dark colored and marshy, generally overlaid with gravel, and resting on blue clay.

**BIG HORN RIVER**, a river of Nebraska, rising in that spur of the Rocky mountains known as the Black hills, which, in a semicircular curve to the N. E., intersects the entire territory, striking the Missouri at the mouth of the Yellowstone. The Big Horn river pursues a nearly northerly direction. It meets with the Wind river from the Wind river mountains on the W., about in the centre of the territory, whence pursuing still a northerly direction, with a slight curvature to the W., it enters the Yellowstone at Mannel's fort.

**BIG SPRING**, a post village of Breckenridge county, Kentucky, S. W. of Louisville. The place receives its name from a large spring which rises near the centre of the village, and the waters of which, after flowing a few hundred feet, suddenly disappear into the ground.

**BIGAMY**, the marrying of a second wife or husband during the life of the first. This is an offence in all Christian countries. Exceptions are, however, created where the first marriage is void, or has been dissolved by competent authority. By the laws of New York, the offence involves imprisonment not exceeding 5 years. The exceptions are, absence of the first

husband or wife for 5 years, without the residence being known to the party marrying a second time; or deliberate absence from the United States for a like period; or divorce, except for cause of adultery in the party marrying a second time.

BIGELOW, JACOB, M. D., LL. D., an American physician and writer, born in Sudbury, Mass., in 1787; graduated at Harvard university in 1806, and commenced practice in Boston in 1810. A skilful botanist, he published, in 1814, the *Florula Bostoniensis*, and afterward an enlarged edition of the same work; he also published his "American Medical Botany," in 3 vols., 8vo, with plates. He had at that time an extensive correspondence with European botanists, and different plants were named for him by Sir J. E. Smith, in the supplement to "Rees' Cyclopædia," by Schrader in Germany, and De Candolle in France. For more than 40 years he has been an active and distinguished practitioner of medicine in Boston; during half of this time he was a physician of the Massachusetts general hospital, and held the offices of professor of materia medica and of clinical medicine in Harvard university. He also for 10 years delivered lectures on the application of science to the useful arts, at Cambridge, as Rumford professor; these were afterward published under the title of "Elements of Technology." He was one of the committee of 5, selected in 1820, to form the "American Pharmacopœia;" and the nomenclature of the materia medica afterward adopted by the British colleges, which substituted a single for a double word when practicable, is due in principle to him. He has published numerous medical essays and discourses, some of which are embodied in a volume entitled "Nature in Disease," published in 1854; one of these essays, "A Discourse on Self-Limited Diseases," delivered before the Massachusetts medical society in 1835, had unquestionably a great influence in modifying the practice of physicians at that time and since. He was the founder of Mt. Auburn cemetery, near Boston, the first establishment of the kind in the United States, and the model of those which have followed; he has found time to indulge his artistic tastes in its various decorations, and the much admired stone tower, chapel, gate, and fence, are all made after his designs. He has the reputation of an accomplished classical scholar, and has been an occasional contributor to the literary periodicals and reviews; he is an excellent humorous writer both in prose and verse, and a volume of poems, entitled "Eolopœsis," has been attributed to him. He was for many years the president of the Massachusetts medical society, and of the American academy of arts and sciences, which last office he now holds. In commemoration of his services, the trustees of the hospital, in 1856, ordered his marble bust to be placed in the hall of that institution.

BIGELOW, JOHN, editor of the "New York Evening Post," was born at Malden, in Ulster county, N. Y., Nov. 25, 1817, graduated at

Union college, 1835, studied law with the late Robert Sedgwick, and was admitted to the bar of New York city in 1839. He practised law with success about 10 years, varying the routine of professional duties with various literary labors. In 1840 he was occupied as literary editor of the "Plebeian," and in 1843, 1844, and 1845, was a frequent contributor to the "Democratic Review," edited by John L. O'Sullivan, subsequently minister to Portugal. The articles by Mr. Bigelow in the "Review" which attracted most attention were those on "Constitutional Reform," "Executive Patronage," "The Reciprocal Influences of Civil Liberty and the Physical Sciences," "Lucian and his Age," and "Pascal." He also edited Gregg's "Commerce of the Prairies," and other popular books of travel. In 1845, Mr. Bigelow was appointed by Gov. Wright one of the inspectors of the state prison at Sing Sing, and held the office 8 years, after which it was made elective by the people, under the new constitution of 1846. While in this position, he was the author of a number of most useful reforms in the discipline of the prison, mitigating its harshness, and improving its efficiency, greatly to the advantage of the inmates and of the state. In Nov. 1850, he became a partner with Mr. Bryant in the ownership of the "Evening Post," a position which he still holds. In Jan. 1850, he made a voyage to Jamaica, one of the fruits of which was his "Jamaica in 1850," a small volume on the economical, social, and political condition of that island, which had a rapid sale, and which was pronounced by some of the leading reviews and statesmen in Great Britain, the most valuable of modern works upon the subject. In the winter of 1854, he again sailed for the West Indies, visiting Hayti and St. Thomas, and during his journey collected materials for a work on Hayti, a few instalments of which have appeared in the "Evening Post."

BIGELOW, TIMOTHY, a lawyer of New England, born in Worcester, Mass., April 30, 1767, died May 18, 1821. He was the son of Col. Timothy Bigelow, who served in Arnold's expedition to Quebec, graduated at Harvard college in 1786, was admitted to the bar, and settled in practice at Groton, Mass., in 1789. He took an active part in politics as a firm federalist, was for 20 years a member of the state legislature, and 11 years speaker of the house of representatives, and a member of the Hartford convention. In 1807 he removed to Medford, and kept an office in Boston. One of his daughters married Abbott Lawrence, late minister of the United States to England. His legal standing and practice were at the head of his profession in his time; and in the course of 32 years, he was supposed to have argued 10,000 causes.

BIGLAND, JOHN, an English author, born in the year 1750, died in London in 1832. His books at the time of their appearance were greatly praised. The principal of them are a work on natural history, exhibiting the power,

goodness, and wisdom of the Deity, a work on the study of ancient and modern history, and a history of Spain, a French translation of which has recently been published in Paris. His books have been extensively used in the United States.

BIGLOW, WILLIAM, a New England school-master and poet, born at Natick, Mass., Sept. 22, 1773, died at Boston, Jan. 12, 1844. He was first established as a teacher in Salem, and in 1799 delivered a poem on education before the Phi Beta Kappa society at Cambridge. He then took charge of the Latin school in Boston, preaching occasionally, writing for different periodicals, and publishing educational textbooks. Here he fell a victim to intemperate habits, and was compelled to retire to his home in Natick. In this state of his fortunes it was his habit to lounge about the newspaper offices at Boston, write poetry for his friends, the editors, while the humor lasted, and then return to his rural retreat. He taught, also, a village school in Maine, and in the latter part of his life was employed as a proof-reader in the university printing office at Cambridge. He had a genial and pleasant humor, and was a ready versifier, as well as an agreeable prose writer. His "Cheerful Parson," and others of his songs, were much admired by his contemporaries, and are well worthy of remembrance. He also published, in 1880, a "History of the Town of Natick," and one of Sherburne, Mass. But his best and most numerous writings were in periodicals—the "Village Messenger," of Amherst, N. H., which he edited in 1796, the "Federal Orrery," and "Massachusetts Magazine."

BIGOT, MADAME MARIE, a German pianist, born at Colmar, March 3, 1786, died Sept. 16, 1820. At 18 she was married, and soon after removing with her husband to Austria, was enabled to complete her musical education under Haydn, Salieri, and Beethoven. Political causes compelling her husband to emigrate to France in 1809, she was there so fortunate as to receive the advice and instructions of such men as Cherubini and Auber, from whom she acquired much knowledge of the art of composition. In 1812 her husband accompanied the expedition to Russia, where he was taken prisoner. The straitened circumstances which this misfortune caused, induced Madame Bigot to open a school for instruction in music, which was soon thronged with scholars. Unfortunately, her health failed her here, and she soon died of an affection of the chest. She was a woman of genius, and was esteemed by Haydn and Beethoven, who bestowed the highest encomiums upon her. She was the first to introduce the music of Beethoven into France.

BIHERON, MARIE CATHARINE, a Parisian woman who attained to a rare skill in anatomy, born Nov. 17, 1719, died in 1786. She was the daughter of a physician, and devoted herself to the practice of fashioning in wax the members of the human frame. For 47 years

she worked in this department; her *chef-d'œuvre* was the model of a female figure arranged in small pieces, so that every part of it, both exterior and interior, could be examined in detail. The medical men of Paris were bitterly opposed to her, with the exception of Jussieu and Villoison. She was forbidden to take apprentices. Migrating to London, she succeeded better, and opened an anatomical exhibition, to which she charged half a crown as admission fee. The Russian ambassador bought it at her death for Catharine II.

BILA, a river of the island of Sumatra, which flows through the Batak territory, and is the chief avenue of communication from the sea with that interesting region. Its numerous branches water the lovely valleys of Mandheling, described by recent Dutch writers as surpassing in picturesque beauty, fruitfulness of soil, abundance and variety of the animal creation, soft serenity of climate, and happy condition of the people, any other portion of Sumatra or of the Indian islands. The frightful desert plains of Tobah and Partibi bound the valley of Bila on the north and south; the mountain ranges of Mertimpang and Draut enclose it on the west; and the sandy wastes, peopled by marauding Bajans on the eastern coast, complete the barrier that hems in this happy valley; leaving for the only outlet to its people the Bila stream, which disembogues into the straits of Malacca, in lat. 8° 28' N., about 220 miles from Singapore. The river is considered navigable about 85 miles for vessels drawing not over 13 feet water.

BILBAO, the capital of Biscay in Spain, on the river Nerva, 6 miles from its mouth at Portugalete; pop. 15,000. There is an old and a new town, the latter of which is well built; an arsenal, a navigation school, 5 churches, and several religious houses. The iron mines of Veneras, 5 miles from Bilbao, are extraordinarily productive, and the ore of fine quality. The river is navigable only for small vessels; larger ones bring up 8 miles below the town. The most important article of export is wool, beside which chestnuts, oil, and wine are sent to northern Europe. Bilbao was founded in 1800 by Don Diego Lopez de Haro, was occupied by the French in the wars of Napoleon, and during the Carlist wars was bravely defended against Zumalacarreui, who was mortally wounded here June 10, 1835.

BILBERRY, or BLUEBERRY, the name of a shrub and its fruit, a species of *vacinium*, or whortleberry. There are 2 kinds of this shrub: a taller and a dwarf variety. The fruit of the dwarf shrub in Europe, and that of the taller variety in Canada and the United States, are both called bilberry.

BILDERDIJK, WILLEM, a Dutch poet, born in Amsterdam, Sept. 7, 1756, died at Haarlem, Dec. 18, 1831. Familiar with the languages and literature of Greece, Rome, and of the principal modern European nations, he also had a large acquaintance with jurisprudence, history,

antiquities, geography, geology, and theology. In the university of Leyden, where he devoted himself to every branch of erudition, he gained 8 prizes for poems, the subject of one of which was the influence of poetry on political government. He published a volume in 1779, principally of imitations and translations of the Greek poets, and the next year gained a prize from the literary society of Leyden on the relations between poetry and philosophy. He soon after adopted the legal profession, practised as an advocate at the Hague, attached himself to the house of Orange, thereby incurring the enmity of the patriots, and was obliged to emigrate when the French army under Pichegru invaded Holland in 1795. He travelled through Germany, remaining 2 years at Brunswick, where he published various small pieces, a didactic poem on astronomy, and a translation of Voltaire's *Ce qui plait aux dames*. He passed thence, in 1800, to London, where he lectured upon literature, and translated into Dutch many of the poems of Ossian. Returning to Amsterdam in 1806, he was presented to King Louis Bonaparte, and became his instructor in the Dutch language. He received a pension, and was made a member of the institute of Holland, but upon the abdication of King Louis in 1810, lost his pension, was regarded with suspicion by the imperial police, and, leaving Amsterdam, supported himself till his death in small provincial cities by philological labors. Yet in whatever circumstances, he never ceased to cultivate the muses, and hence the immense number of his poems, of almost every variety, from the epigram to the epic. Possessing great vigor of imagination, richness of thought, and an easy and harmonious style, his countrymen place him by the side of Schiller and Byron, and his works are better known out of Holland than almost any others in Dutch literature. Beside numerous smaller poems, translations, and patriotic fragments, he left a number of tragedies, and a strange epic poem on the "Destruction of the First World."

**BILE**, the green and bitter liquid secreted by the liver. This liquid presents differences in the various classes of animals, although its principal characters are everywhere the same. Taken from the gall-bladder, it is a mucous, viscous, somewhat transparent fluid, capable of being drawn out in threads of a green or brown color, of a bitter but not astringent taste, sometimes leaving a rather sweet after-taste, and of a peculiar odor, often having, when warmed, the smell of musk. It is usually weakly alkaline, often perfectly neutral, and only in disease, in rare cases, acid. It differs from other animal juices in being very long before putrefying, when the mucus mixed with it has been taken away. The chemical composition of bile is still but little known, the best chemists being in complete disagreement in this respect. However, there are some points which seem to be decided. For instance, there

is in bile a resinous substance, which is a combination of 1 or 2 acids with soda; there is a coloring principle (the *biliverdin*), a peculiar fatty matter, the *cholesterin*, and other fatty substances, salts, and water. According to Demarçay, the bile of oxen has the following composition:

Water.....	875
Choleate of soda.....	110
Coloring and fatty matters, mucus, &c.....	5
Salts.....	10
	<hr/> 1,000

Demarçay admitted only 1 acid in bile, and he considered this liquid as a fluid soap, resulting from the combination of this acid (choleic acid) with soda. Strecker has found that the cholic acid of the French chemist is a complex one, and he has shown that it is composed of 2 acids, one of which he calls cholic and the other choleic. According to the researches of Bensch and Strecker, the choleate of soda is the chief principle of bile, as regards its relative quantity, and also its importance. The choleic acid is a nitrogenized substance, containing sulphur in greater proportion than the other nitrogenized matters. As in the bile of most of the animals sulphur exists only in the choleic acid, and in the proportion of 6 per cent., it is possible to ascertain easily the quantity of this acid in any kind of bile. It has thus been found that almost the whole of the alcoholic extract of bile consists in choleic acid in the fox, the sheep, the dog, &c., while in the bile of the ox there is as much cholic as choleic acid. The salts formed by these 2 acids amount to at least 75 per cent. of the whole of the solid constituents of bile. Normal human bile contains, according to Frerichs, about 14 per cent. of solid constituents, but Lehmann justly remarks that the quantity of water, and, consequently, the proportion of solid constituents, may be as variable in bile as in most of the other secretions. Gorup-Besanez found 9.18 per cent. of solid constituents in the bile of an old man, and 17.19 per cent. in that of a child aged 13 years, but many more proofs are necessary to determine that bile is more aqueous in old age than in childhood. Lehmann says that the organic constituents of human bile amount to about 87 per cent. of the whole solid residue. The proportion of the other elements of bile, i. e., bile-pigment (biliverdin), cholesterin, fats, and mineral salts, has not yet been positively determined. The 2 special organic acids of bile can be decomposed into various substances. They both, when treated by alkalis, give origin to cholalic acid, and to dyslysine, but one of them (the cholic acid) produces also glycocoll, and the other (the choleic acid) taurine. When treated by powerful acids, cholic acid gives origin to choloidic acid, glycocoll, and dyslysine, while choleic acid produces taurine, choloidic acid, and dyslysine. Cholesterin and margaric and oleic acids are kept in solution in bile by the two principal organic acids of this secretion. The biliverdin, or the coloring principle of bile, is a substance re-

sembling in its composition the hematosin or coloring principle of blood. It contains nitrogen and iron, as do all the organic coloring matters, according to M. Verdeil. The biliary sugar, or picromel, seems to be only a product of decomposition of some of the constituents of bile. The biline of Berzelius and Mulder seems to be a mixture of alkaline cholates and choleates.—The ancient physicians and physiologists used to consider the organ which secretes bile, the liver, as a most important one. But after Aselli, in 1622, had discovered the lymphatic vessels, a reaction took place against the importance attributed to the liver, and some physiologists went so far as to think that its share in the vital actions was almost null. In France the researches of many physiologists, and particularly of Prof. Bernard, have shown that the liver is one of our most important organs, and recent experiments have proved that bile is a very useful secretion, if not an essential one. The first question we will examine is whether or not bile is an absolutely necessary secretion. In many dogs Schwann opened the abdomen and the gall-bladder, and succeeded in forming a biliary fistula, after having tied the bile duct. Nine of these animals very quickly died; 6 lived 7, 13, 17, 25, 64, and 80 days. Two only survived definitively, but in them a new bile canal was formed. Of the 6 dogs that lived from 7 to 80 days, 4 seemed to die starved, having lost their fat. The 2 others after a few days began to regain their fat, and reached their initial weight up to a certain time, when they became again emaciated and finally died. Blondlot has seen a dog living 5 years after the occlusion of the bile duct, and the formation of a biliary fistula, through which the bile flowed out. During this long period the health of the animal was usually very good. Unfortunately, no precaution was taken to prevent its licking the wound, and probably it took and swallowed in this way a certain amount of bile. More recently Schwann has repeated his experiments on 20 dogs, out of which only 2 survived, one 4 months and another a year. Nasse kept a dog alive 5 months with a biliary fistula. Its appetite was good, and it ate about double the quantity of meat that a healthy dog of the same size would have taken, and nevertheless it died almost completely deprived of fat. It results from very careful experiments of Bidder and Schmidt, and of their pupil, Schellbach, that the cause of death when bile is not allowed to flow into the bowels, and passes out of the body, is that the animal has a great difficulty in repairing the loss of fat and of nitrogenized substances, which go out with the bile. In a dog operated upon by these physiologists, the quantity of food taken was much greater than before the operation, and the consequence was that the animal did not lose his forces and remained fat, though less so than before. Prof. Bernard, according to Dr. Porchat, has ascertained that if adult dogs may live many months when bile flows out of their body

by a biliary fistula, it is not so with young dogs, in which death always occurs quickly in such circumstances. Some facts observed in men (in children by Dr. Porchat, in adults by Dr. Budd) seem to prove also that adults may live much longer than children when there is no bile passing into the bowels. Can we conclude from all the preceding facts that bile is not necessary? Can we say, with Blondlot, that bile is a useless secretion? It seems very probable that bile is not absolutely necessary to digestion, as some animals have lived a long while without bile; but even in these cases there is room for doubt. For instance, Blondlot's dog was not prevented licking its wound, and probably swallowed a little bile, as Schwann has seen his dogs doing; and Bidder and Schellbach, we cannot understand why, at times, gave pieces of liver (containing bile) as food to the one of their dogs that was the least affected by the operation. We may sum up thus: 1. That bile has not yet been positively proved not to be absolutely necessary to digestion and to life. 2. That it seems probable, however, that its function is not absolutely essential. 3. That when bile is missing in the bowels (and flowing out of the body by a fistula), the principal cause of death is the loss of fat and of albuminous matters. We will add to this last conclusion, that, according to Dr. Brown-Séguard, it would be very important to repeat the experiments of Blondlot, Bidder, and others, in trying to repair by food the loss of certain materials of the body which go out with bile, and which are not present in sufficient amount in meat and bread. Among these materials sulphur is the principal, and it would be easy to give a great deal of it by feeding the animals upon eggs and other kinds of food which contain more sulphur than meat and bread. This view of Dr. Brown-Séguard is grounded, not only on the fact that bile flowing out of the body takes away a great quantity of sulphur and other principles, but also that when bile passes freely into the bowels, its elements, and particularly soda and sulphur, according to Liebig, are absorbed.—A question which is intimately connected with that we have examined already concerning the importance of bile, is whether this liquid is to be considered as an excrement or as a useful secretion. We think it is certain that some, at least, of the principles of bile are absorbed in the bowels, if not most of them, as Liebig thought, and that, therefore, bile cannot be said to be entirely an excrement. However, some of the compound constituents of bile are transformed in the bowels, as Mulder and Frerichs have shown, and they are expelled with the fecal matters. We are consequently led to conclude that bile is only partly an excrement, if it is so at all. We say if it is so, because the part of it which is expelled with the fecal matters, may have some use before being expelled.—The fact that there is a very great quantity of bile secreted in a day, throws some light on the question of its reabsorption. Blondlot says that a

dog of a medium size secretes from 40 to 50 grammes (nearly 1½ ounce) a day. Nasse and Platner speak of 200 grammes (6½ ounces), as the secretion of bile in a dog weighing 10 kilogrammes (20 lbs), which gives a proportion of 1 to 50. Schmidt and Bidder have found that the quantity of bile varies extremely with the species of the animal experimented upon. While for each 2 pounds of the body of a cat there is a secretion of 14 grammes (½ ounce) of bile in a day, in the dog there is almost 20 grammes (¾ of an ounce), in the sheep 25½ grammes (¾ of an ounce), and in the rabbit the enormous quantity of 136 grammes (4½ ounces). In weighing the solid residue of the fecal matters of a dog for many days, and comparing the result obtained in so doing to the weight of the solid residue of bile during the same time, Schmidt and Bidder have found that the two quantities were alike, so that necessarily a good part of the principles of bile is absorbed in the bowels. They have also ascertained that almost all the sulphur of the bile is absorbed. They think that only a small quantity of bile transformed into an insoluble substance (dyslysine) remains unabsorbed and goes out with the excrements.—Sylvius de le Boë, and afterward Boerhaave, have imagined that bile is employed to neutralize the product of gastric digestion, chyme, which is very acid. This view has been considered quite wrong by almost every one, but Lehmann justly remarks that there is some truth in it, and he affirms that bile certainly contributes to the neutralization of the free acids of chyme. Bile no doubt acts as a solvent of fat, at least by one of its constituents, the choleate of soda, as has been shown by Strecker, although Bidder and Schmidt have found no difference in the quantity of fat absorbed, whether the bowels contained bile or not. But their mode of deciding this question is open to many objections. It has been said that bile prevents putrefaction taking place in chyme, or at least in fecal matters. Most of the recent experimenters agree with Tiedemann and Gmelin in admitting this influence of bile. Dr. Porchat has observed, in children in whom bile could not pass into the bowels on account of the occlusion of the bile duct, that the fecal matters were putrefied, as Bidder and Schmidt, Frerichs, and others, have observed in animals in which they had tied this duct. However, it seems that in some cases the absence of bile is not sufficient to allow putrefaction to take place in the fecal matters, as Blondlot says that he has observed no difference between these matters in dogs in good health and in those operated upon. The water contained in bile helps in the dissolution of certain elements of chyme, and, in so doing, renders their absorption more easy.—Bile acts as an excitant on the mucous membrane of the bowels, to produce reflex contractions; it favors, in this way, the propulsion of food and of fecal matters. According to Schiff, bile produces contractions in the intestinal villi. It is said, also, that bile increases the secretion of

the intestinal mucus, and prevents constipation. All these views may be partly true, but it is certain that, without bile, the expulsion of fecal matters takes place regularly.—Many physiologists think that bile, like most of the secretions, contains some effete matters which cannot be of any use in the blood, or which might be deleterious. In opposition to the views of those who admit that the secretion of bile is for the purpose of purifying the blood, and who still regard this liquid merely as an effete carbonaceous matter which the respiration has not removed, Lehmann says that the bile—a secretion by no means poor in nitrogen and hydrogen—is not separated in any increased quantity when the process of oxidation in the lungs happens to be disturbed; that there are no pathologico-anatomical facts which favor the view that the liver can act vicariously for the lungs; and, lastly, that the separation of carbon by the liver, as compared with that by the lungs, is so trifling, as shown by Bidder and Schmidt, that the liver can hardly be regarded as essentially a blood-purifying organ, in so far as the elimination of carbon is concerned. However, it is certain that when bile is not excreted freely in man, jaundice, and frequently certain nervous disturbances, are produced, and these phenomena must be attributed to the action of some of its principles. But 3 explanations may be given concerning the production of these phenomena, and we do not yet positively know which is the best. In the first place, it may be that the principles of bile preëxist in the blood, and that when they are not secreted, their quantity increasing, they produce the deleterious influence which sometimes results in jaundice; in the second place, they may be secreted, and in consequence of some obstruction of the bile duct, they may be absorbed, and then produce their ill effects; finally, in the third place, they may be changed into toxic substances either in the blood or in the liver, or the biliary ducts. As regards the first of these views, Lehmann has tried to prove, on good grounds, that the secretion of bile is not, like the urinary secretion, a mere separation of certain principles from the blood; and, therefore, we may conclude that it is not probable that bile, even if it contains toxic substances, results from a depuration of the blood. If we admit the second view, that the liver produces most of the principles of bile, and that these principles are absorbed in cases of jaundice, we find that we cannot explain the toxic phenomena which then sometimes take place, because they are not constant, and they exist in cases where jaundice is or is not very considerable, while they may not appear in cases of deep jaundice. Dr. Budd has been led to the third view above stated, which is that poisonous substances are formed in the blood from the principles of bile. The function of depuration of the blood, attributed to the liver, seems, therefore, to be of much less importance than some persons have thought. Dr. Budd relates several

cases in which the passage of bile into the bowels was entirely prevented by the complete closure of the bile duct, and in which, nevertheless, life was prolonged for many months. We must say, however, that the secretion of substances which may, when they are absorbed, and when they accumulate in the blood, be transformed into a poison, ought in some respects to be considered as a depuration. —It has been a much debated question whether bile is secreted from the blood of the portal vein or that of the hepatic artery. Experiments on animals and pathological facts have been mentioned in favor of both these opinions. When a ligature is placed on the portal vein, bile not only continues to be secreted, but the other functions of the liver also continue; but this fact, as Brown-Séquard remarks, cannot prove that the blood of the portal vein is not necessary for these functions, as this blood, after the ligature, passes into the vena cava, and afterward into the arterial circulation, and, therefore, into the liver, by the hepatic artery. It seems very probable, indeed, from the great quantity of bile produced in a day, that the portal blood, if not the only source of the secretion of bile, is at least employed in a great measure for this secretion.

BILFINGER, GEORG BERNHARD, philosopher and mathematician, born at Canstadt, in Württemberg, Jan. 28, 1698, died at Stuttgart, Feb. 18, 1750. He was born with 12 fingers and 12 toes, and submitted to an operation which removed the deformity. He studied with Wolf at Halle, and became a disciple of the school of Wolf and Leibnitz. In 1725 he received an invitation from Peter the Great, to the chair of logic and metaphysics in the new college at St. Petersburg. He now solved the problem of the cause of gravity proposed by the academy of sciences at Paris, and gained the prize. Being recalled by the duke Charles Edward of Württemberg, he returned to Tübingen and proceeded to lecture on theology; here his originality in style and ideas soon made him popular, and in 1735 he was appointed a privy councillor. In his new position he proved himself to possess administrative abilities, and by severe study he soon became as celebrated for his political and statistical knowledge as for his scientific attainments. He afterward paid particular attention to agriculture, and promoted the culture of the vine. He was the author of numerous theological and philosophical works.

BILGUER, PAUL RUDOLF VON, a famous chess-player, born at Schwerin, Germany, in 1808, died in Berlin Oct. 6, 1840. He entered the Prussian army in 1833, and was, not long afterward, promoted to a lieutenancy. On March 18, 1840, he performed at Berlin the curious feat of playing 8 games at once with as many different opponents, conducting 2 of the contests without seeing the boards and men. This intense mental effort is supposed to have been the primary cause of the illness which resulted in his death. His *Handbuch des Schach-*

*spiel* (Berlin, 1843 and 1852), completed after his death by his friend T. Heydebrandt von der Lasa, made an epoch in the history of chess, and is still the best practical work on that game.

BILIARY DUCTS are small ducts through which the bile flows from the liver and the gall bladder to the duodenum. That portion of the biliary duct which leads directly from the liver to the duodenum gives off a small branch which leads into the gall bladder, in which the gall is collected. This small branch is called the cystic duct, and that part of the larger bile duct which leads from the liver to this cystic duct, is called the hepatic duct; while the rest of the bile duct, leading from this point of junction to the duodenum is called the *ductus communis choledochus*. This is about the size of a goose quill, and 8 inches long.

BILIOUS FEVER is caused by marsh miasmata, and is most common in the middle and southern sections of the United States, although it occurs in all parts, from the northern lakes to the gulf of Mexico. The localities in which it is most frequent are the western prairies, the valleys of streams, the borders of lakes and ponds, and the neighborhood of marshes; the seasons in which it occurs are the summer and autumnal months. In this form of fever, the febrile phenomena are characterized by striking exacerbations and remissions, one paroxysm occurring in the 24 hours. It is called bilious remittent fever, and differs from intermittent fever in the intermission not being complete. During several days previous to the attack, the patient complains of lassitude, with uneasiness at the epigastrium or region of the stomach, pains in the back, in the limbs, and in the head, and also restlessness at night. The invasion is attended by coldness of the surface, and not unfrequently by shivering. This is soon superseded by heat, febrile flushes, or by alternations of heat and cold; which are soon succeeded by burning heat and dryness of the skin, flushing of the countenance, and injected eyes, with great increase in the headache and pains of the back and limbs. The tongue is foul, and the mouth sometimes dry and clammy. There is nausea, and sometimes vomiting, with much thirst. The pulse, which was weak and quick during the cold stage, is now full and strong; the breathing may be hurried, and the patient is extremely restless. The throbbing and pain in the head are occasionally very violent, and may end in delirium. The urine is scanty and highly colored; the bowels usually constipated, and some degree of tenderness is felt on pressing with the hand over the stomach. After some 12 or 18 hours, these symptoms are succeeded by partial perspirations and an abatement of the febrile symptoms; or these may subside without any moisture on the skin. The remission is marked by the pulse being less full and frequent, the skin cooler, and the pains in the head and back and loins relieved; the stomach is in a less irritable state, and the patient free from delirium. Nine or ten

hours elapse before another paroxysm occurs, which may come on at once, without any feeling of cold, or be preceded by chilliness or shivering. The disease continues in this manner with alternate remissions and paroxysms of fever. If the case end favorably, each succeeding paroxysm becomes milder, until the fever disappears; or it may be carried off by copious perspirations. The periods of remission and increased severity are very irregular, though the abatement of the fever very generally occurs in the morning. In cold climates the disease may continue 14 days or more, but in hot countries it is much more rapid in its course, terminating sometimes as early as the 8d day, and usually in 5 or 7 or 9 days. In the more violent and dangerous cases, the skin is burning hot and the thirst intense; the vomiting incessant, scarcely any thing being retained on the stomach. There is also violent throbbing or shooting pain of the head, attended sometimes with furious delirium. The remissions are short and indistinct; and where the case proceeds to a fatal termination, the fever may become continued. The tongue is furred, red, contracted, and dry, or crusted with black matter; the skin and eyes may have a yellowish tinge, and dark-colored matter may be discharged from the stomach. In some cases there are copious perspirations before death, and the patient sinks rapidly; or the hot, pungent, dry skin may continue to the last.—Bleeding was formerly deemed necessary in bilious fever, but is only now employed in cases of actual or threatened inflammation, or active congestion. It is acknowledged that it cannot cure or shorten the disease, although it may subdue a violent and dangerous inflammation. It was formerly the practice also to commence with an emetic; but this is only indicated where there are crude ingesta or an accumulation of bile in the stomach, shown by frequent retchings and a bitter taste in the mouth. In all cases an active cathartic is deemed necessary, and jalap and rhubarb combined with calomel are mostly used, but calomel is discontinued altogether by some practitioners, and the extract of May-apple or *podophyllum peltatum* substituted in its stead. The root is the part used and in doses of from 10 to 20 grains. It is also used alone, and alternately with *pulvis jalapa compositus*, which is a mixture of one part of jalap and two parts of cream of tartar. Diaphoretics are always indicated in the hot stage, and the "effervescent draught" is perhaps the best in an irritable state of the stomach; but water, with anything to flavor it agreeably to the taste of the patient and the susceptibility of the stomach, is the main agent in producing perspiration to relieve the fever. Cold sponging of the surface of the body with vinegar and water is sometimes very useful, where it does not give a sensation of chill; and where the head is much affected, the application of cold water is very beneficial. As soon as a remission takes place, which may be known by an abatement of all the symptoms, the sulphate of quinine

should be administered. In hot climates the remission may be short and not very marked, but the opportunity should not be lost. Two grains of quinine, in a little water, or in wine and water, may be given every hour or every two hours during the remission. It must be observed, however, that the same dose will not suit every individual; some persons can hardly bear the smallest quantity, while others require larger doses to produce a decided effect. It is always prudent, therefore, to commence with minute doses and increase the quantity, if necessary, afterward. The exhibition of quinine must be suspended on the recurrence of the febrile symptoms, and resumed during the period of remission. It should be continued in diminishing doses, during several days after the fever has entirely disappeared, to prevent a return, which is not uncommon where the treatment is too soon discontinued. Where sudden sinking of the vital powers occurs, the pulse becoming feeble and irregular, the face pallid, the eyes sunken in their sockets, and the limbs cold and clammy, stimulants should be immediately given. Port wine or brandy, sherry or madeira, in sago or in arrow-root, should be given every hour, or oftener, until the pulse begins to rise and the extremities are warm. Champagne is also an excellent stimulant in all such cases. When the pulse has been restored and warmth in the extremities, the stimulants are discontinued, the cold perspirations constantly wiped off, and the extremities are rubbed with warm flannels or rough towels; opium may also be administered in minute doses, to allay excessive pain and restlessness. The patient's drink should consist of barley-water, lemonade, soda-water, or pure cold water, when agreeable to him. Liquids should not be taken in large quantities at once, where the stomach is very irritable; but where it can be borne with ease, and is grateful to the patient, a very copious draught of cold water is sometimes very beneficial in producing perspiration, when other things have failed. In the low malignant varieties of bilious remittent fever, effervescing drinks, such as seltzer or soda water, light beer, &c., are often very beneficial. Change of air is also very desirable during convalescence.

BILL, BROWNBILL, GLAIVE, VOULGE, or GNEARME, all names for nearly the same instrument, which, with some slight modification, was the standing weapon of the English infantry at close quarters, as was the long bow their weapon at distant range, from the days of the battle of Hastings, at which the Saxons used the bill and the Normans the bow, until those of Queen Elizabeth; for the English were never spearmen, nor ever fought in heavy columns, like the Scots and Swiss, until after the musket had superseded the bow; when, for a short time previous to the invention of the bayonet, the pike was used, during the wars of the commonwealth and of the Low Countries. The original brownbill was a ponderous cutting

weapon with 2 edges, that forward of the shaft having a concave or sickle blade, that to the back, a sort of angular cutting face, the upper part projecting before the base, so as to give a drawing blow. This terrible instrument was nearly 8 feet in length, and 10 or 12 pounds in weight, set erect on a shaft of 8 or 4 feet. It was wielded with both hands, and could sever a horse's head or a man's thigh or shoulder, through the strongest mail or plate armor, as a modern woodman's bill-hook slices off a hazel sapling. The weapon was afterward lengthened and lightened, and provided with a spear head, so that the holder could charge it like a lance, and sometimes with a cutting hook, for severing the bridles of the men-at-arms, or pulling them out of their saddles.

BILL, in congress or parliament. See *Act*.

**BILL IN EQUITY**, is the preliminary proceeding of an equity suit. The bill contains a statement of the plaintiffs' case. In English law it is addressed to the lord chancellor, and commencing with the names of the plaintiffs, proceeds to state the circumstances of their case, and the grievance to be redressed; setting out all documentary evidence relied on. From the statement it proceeds to charge against the defendants, collectively or individually, the various facts which either specifically or by induction constitute the gravamen of the case. It concludes with the prayer for relief, and with interrogatories both general and specific, to which the plaintiffs require an answer. The bill may not join distinct subjects of complaint; if so, it is objectionable for multifariousness. It must be as compendious as possible, otherwise its length is liable to be reduced at the plaintiffs' cost. It must contain no irrelevant matter, otherwise it may be excepted to for impertinence; nor scandalous matter, that is, the narrative of mere hearsay report, or as personally offensive expressions, which may be expunged. The introductory or narrative part must support the charging part; the charges must cover all the case intended to be made against the defendants, and the interrogatories must demand specific information, either affirmation, denial, or explanation, upon all those points which are important to the establishment of the plaintiffs' case. As new facts come to the plaintiffs' knowledge, either from the defendants' admissions or from other sources, the bill may be amended, and new interrogatories added, while bills of revivor and supplement are filed to bring the representatives of deceased parties or of newly born children before the court. This form of procedure necessarily leads to an immense quantity of verbiage and repetition, but adherents of the practice affirm that it is warranted by experience. In answer to the recommendation of law reformers that every thing stated by the bill shall be assumed to be matter of inquiry, and that every thing not expressly denied by the otherside shall be taken to be admitted, they reply that this was the ancient practice, and that the modern is an improvement on it. The ancient

practice, it is said, led to the introduction of infinitely greater prolixity, both of statement and counter statement, while the suitor suffered because the gist of his case was not concisely brought to the notice of the court. By the New York code of procedure, the distinction between law and equity is abolished. Every suit is designated a civil action, and is commenced by the same process. The complaint is now the substitute for the bill in equity, and presents the facts of the plaintiffs' case in a much more compendious shape. Whether that merit is fully attained is, however, an open question.

**BILL OF EXCHANGE**. See *EXCHANGE*.

**BILL OF HEALTH**, that part of a ship's papers which relates to the health of the crew and passengers. It is authenticated by the captain and medical man on board, and sometimes by the consul at the port of embarkation. A false return subjects the offender to severe penalties. Vessels coming from ports in which plague, yellow fever, or other infectious diseases are prevalent, are of course objects of particular attention. A clean or a foul bill of health determines as to the necessity of quarantine.

**BILL OF INDIOTMENT**. See *INDICTMENT*.

**BILL OF LADING**, a commercial instrument, signed by the master of a ship as the receipt for cargo to be conveyed as freight. This document specifies the goods, the ship, the price, and the port of delivery, with such other particulars as may be requisite. It stipulates for their safe delivery, and constitutes the contract between the shipper and the ship owner. It is generally signed in duplicate, the 2 parts of which are transmitted to the consignee by different channels. Certain exceptions are usually mentioned, against which the carrier does not guarantee the goods, as the acts of God, enemies in time of war, fire, and the accidents of navigation. The goods are usually deliverable to consignees or their order, sometimes to the order of the shipper, upon payment of freight, as mentioned, primage and average. Primage is a perquisite to the master—a small percentage on the freight. Average is the share in certain small expenses of the ship—pilotage, towage, harbor dues, &c. The bill of lading is assignable, and transfers the ownership of the goods; accordingly, the assignee can maintain an action for recovery of the goods themselves. But an action for damages for non-delivery of the goods in good order must be brought by the shipper. The master's contract is complete on delivery of the goods, in good order, at the usual place of delivery of the port, and upon notice given thereof to the consignee, unless there be any particular stipulation as to the mode of delivery.

**BILL OF RIGHTS**, in English constitutional law, is, properly, the act of parliament 1 William and Mary (sess. 2, c. 2), by which certain claims contained in the declaration of rights were enacted as fundamental principles

of political liberty. The declaration had been delivered at the time the crown was tendered to the prince and princess of Orange, Feb. 13, 1689. It recited the principal grievances which the nation had suffered under the preceding reign, viz.: the assumption as a royal prerogative to grant a dispensation from penal acts of parliament—the establishment of a new tribunal to determine ecclesiastical questions—levying taxes without consent of parliament—maintaining a standing army in time of peace—interfering with the administration of justice and the freedom of elections—exactng excessive bail from prisoners—inflicting barbarous and unusual punishments, and treating as criminal petitions for a redress of wrongs—all of which acts were declared to be illegal. It then asserted the right of subjects to petition—the right of parliament to freedom of debate—the right of electors to choose representatives freely—and various other privileges. These were reiterated in the act of parliament above referred to, with some additional stringency, as in respect to the dispensing power, which by the declaration had been condemned, as exercised by James, as unlawful, but by the act was absolutely and forever taken away. These rights were again asserted, with some additions, in the act of settlement, by which the crown was limited to the Hanover family (12 and 13 William III., c. ii.). Similar provisions were appended to the constitution of the United States, as amendments thereto. They are chiefly declaratory of the freedom of speech and of the press—of the right of citizens peaceably to assemble and petition government for the redress of grievances—of the right of trial by jury—that private property shall not be taken for public use without just compensation—that no law shall be passed by congress for the establishment of any religion, or prohibiting the free exercise thereof. In the constitutions or laws of many of the United States is to be found a similar recital of rights, usually including the privilege of the writ of habeas corpus.

**BILL OF SALE**, an instrument in writing by which personal property is transferred. It is not necessary that it should be under seal, nor is there any difference in the legal effect, other than that the seal imports a consideration; but by the laws of the state of New York even this distinction is virtually abrogated, as the consideration of a sealed instrument can now be inquired into the same as that of any other contract, and the same provision has been adopted in other states. A bill of sale of a ship or vessel is a muniment of title of peculiar importance. In most countries it is either by custom or statute absolutely required. In this country possession of a ship and acts of ownership are presumptive evidence of title, without documentary proof. But this presumption may be rebutted by contrary proof, and the general rule is that a person who has no title can convey none. Mere possession

by the vendor is not sufficient to enable him to give a title, although as between the parties the mere delivery of possession is sufficient without a bill of sale.

**BILLAUD-VARENNE**, JACQUES NICOLAS, a leading member of the French national convention, born at La Rochelle, April 23, 1756, died in Hayti, June 3, 1819. He studied law, and after leading for several years a vagrant life, he finally, in 1785, became an advocate at Paris. He published at Amsterdam, in 1789, a book called *Despotisme des ministres de France*, which was a "full recital of the principles and means used by the aristocracy to keep France in bondage." He renewed his attacks in his pamphlet *Plus de ministres!* which appeared in Paris the following year. Meanwhile, he had assailed the clergy in 2 anonymous publications: *Dernier coup porté aux préjugés et à la superstition*, and *Le peintre politique*, both issued in London, but largely circulated in France. July 1, 1791, at one of the meetings of the "Friends of the Constitution," he proposed to change the French monarchy into a republic; and the same year he published his celebrated pamphlet *Acéphalocratie*, which was followed by a prosecution, ended Sept. 1791, when Louis XVI. took the oath to the constitution, and granted a general amnesty for political offences. Among the Jacobins, Billaud distinguished himself by his ultra opinions. He was appointed, Aug. 10, a member of the commune of Paris, then substitute to the "procureur-syndic," in place of Danton, who had just been promoted to the department of justice. Sent to Chalons to watch some suspected generals, he returned Sept. 20, 1792, to take his seat in the convention, to which he had been elected by one of the districts of Paris. There he pursued the same course of deadly opposition to the monarchy and monarchists. In 1793 he supported the resolution to try Louis XVI. forthwith, and voted not only for the death of the king, but for that of the queen and ministers. He had, beside, a hand in nearly all the extreme measures which were then adopted against so-called internal enemies. He supported the charge by which the unfortunate general Custine was sent to the scaffold. He obtained the repeal of the decree forbidding domiciliary visits during the night, and supported the motion to form a revolutionary army. As a reward for his zeal, he was chosen president of the convention, and member of the committee of public safety. In this capacity, he founded the *Bulletin des lois*, a valuable collection, which is yet continued, and was the framer of the revolutionary government. In 1794 he became dissatisfied with the conduct of Robespierre, especially his aspirations to the dictatorship; so that on the 8th Thermidor he joined the party bent on the overthrow of the new tyrant, and contributed to their success; but this did not save him from being afterward suspected and accused by them. Finally, an inquiry into his acts was ordered, and he was arrested in company

with Collot d'Herbois and Barrère. His popularity among the citizens of the suburbs was so great, that they attempted to rescue him by force on the 12th Germinal; but the mob was quelled, and he, as well as his companions, was sentenced to transportation. Then a more formidable insurrection broke out on the 1st Prairial; but he had already been sent to Cayenne with Collot d'Herbois. There he lived for 20 years in savage retirement, refusing to avail himself of the amnesty offered by Napoleon, after the 18th Brumaire. In 1816, however, he escaped from Cayenne, and went to Port-au-Prince, where, proud and lonely, he barely made a living by the law. Three years later, he died, as stern and immovable as ever.

**BILLAULT, AUGUSTE ADOLPHE MARIE**, a French statesman, born Nov. 12, 1805, at Vannes, in the department of Morbihan. After studying the law at Rennes, he removed to Nantes, where he practised with success. He managed to be elected in succession a member of the municipal council of Nantes, and a member of the general council of the department of Loire Inférieure. He now published pamphlets upon education in France, municipal organization, roads, &c. In 1837, when only 31, his popularity in his department had become so great, that he was chosen to the chamber of deputies by 8 electoral districts. His style of oratory was at first little to the taste of the chamber; but notwithstanding his unsuccessful début, he soon secured for himself a conspicuous place in the assembly by activity of mind, industry, and practical knowledge. As early as 1838, he was appointed a member of the committee to devise a general plan for railways throughout France; the reports which he drew up commanded general attention. On the formation of the Thiers cabinet, March 1, 1840, he accepted the situation of assistant secretary to the minister of agriculture and commerce; but when Thiers was overthrown by Guizot, Billault resigned also. When the treaty upon the right of search, concluded Dec. 20, 1841, by Guizot, was presented to the chamber, Billault made himself conspicuous among its opponents, and his speeches greatly contributed to its defeat. He also took an efficient part in the debate on the Pritchard indemnity. During the following years, he shared in nearly all important discussions, showing a marked preference for questions of foreign policy. He was reckoned among the members of the opposition, and frequently indulged in denunciations of government corruption; he however became the legal adviser of the duke of Aumale, the richest son of Louis Philippe. At the same time he affected to consider himself as the necessary successor of Guizot; but his ambitious aspirations were defeated by the sudden outbreak of the revolution of February, 1848. Being elected to the constituent assembly by a large majority, he now declared himself a republican, voted with the most advanced party, and went so far as to support the democratic project known as the

right to labor. He was not elected to the legislative assembly, and returned to the practice of law. He had early intercourse with the new president, Louis Napoleon, and was frequently called on by him for political advice. On the coup d'état of Dec. 2, Billault at once gave his hearty adhesion to the new régime. He presented himself as the government candidate to the legislative body in Feb. 1852, and was chosen by a handsome majority. He was made president of that assembly, which post he held for a little over 2 years, his nomination as minister of the interior, March 24, 1854, not preventing his continuance in the presidential chair to the end of the session; and on June 6, he presented to the emperor an able report of the proceedings of the body. His acts as a minister are not unworthy of the reputation he had previously acquired as a practical politician. After the attempt against the life of Napoleon III., by Orsini and his accomplices, Jan. 14, 1858, Billault tendered his resignation, expressing a desire to retire to private life; and in Feb., Gen. Espinasse was appointed his successor as minister of the interior, with the additional title of minister of general safety.

**BILLE, STEEN ANDERSEN**, a Danish rear-admiral, and minister of marine, born in Copenhagen, Dec. 5, 1797. Following in the footsteps of his father, who was born Aug. 22, 1751, and died April 15, 1838, and who distinguished himself on various occasions, especially during the memorable siege of the Danish capital by the English, young Bille entered the navy at an early age. In 1819 he joined the French service, and in 1823 he took a part in the Spanish campaign. Subsequently, he was engaged in the naval service of Denmark, and stationed for several years in transatlantic countries, and in the Levant. In 1840 he served on board the *Bellone* during the expedition of that vessel to South America; and in 1845, he made, in the *Galathea*, a voyage round the world, which was undertaken under the auspices of the government, in the interests of commerce and science. On his return to Denmark, he found a new sphere of activity in the Schleswig-Holstein war, during which he was employed in the blockade of the Elbe and Weser, and of the Holstein coast. Finally, in 1852, he was appointed minister of marine, councillor, and rear-admiral. He has been frequently a contributor to the literature of his country. His principal production is an account of his voyage round the world, of which the third and last volume appeared at Copenhagen in 1851.

**BILLIARDS**, a game played with ivory balls, on a flat, oblong table covered with green cloth, having raised, elastic, cushioned edges, with semi-circular apertures, one at each corner, and 2 facing each other, at the centre of the long sides. The dimensions of a full-sized billiard table are 12 feet by 6. The bed, or level surface, over which the cloth is strained as tightly as possible, is composed, in the best improved modern tables, of slate, and the cushions

of vulcanized India rubber. The balls are driven by a cue or a mace, as they are respectively termed; the cue being by far the superior instrument of the two, requiring the greater skill in its use, and producing effects which can hardly be executed with the mace; the latter, indeed, is considered merely as the implement for novices or ladies, to whom it is particularly suited, since to execute finely with the cue sometimes requires the assumption of attitudes which are not becoming to female attire, or to the modesty of the sex. The cue is a straight, round staff of wood, from 4½ to 6 or 8 feet in length, tapering from a diameter of about 1½ inch at the butt to ½ of an inch at the tip, a diagonal slice being taken off one side of the butt, so as to give it an oblique plane surface, which can be laid flatly on the table for the purpose of pushing, when the ball is in such situations that it cannot be reached with the point; the point of the cue is tipped with thin leather, and is frequently chalked while playing, to cause it to take hold, without slipping, of the smooth and polished surface of the ball. The mace is a slender springy staff of some light elastic wood, slenderer and shorter than the cue, with a head of hard wood, fashioned something like a spoon, truncated at the end, and cut into a flat bevel at the under side, so as to allow it to lie flat on the table, with the handle rising from it at a tangent. The mace can only be used, like the butt of the cue, in pushing. In striking with the point, which is the true and scientific play, and the only play by which fine execution can be accomplished, the player grasps the cue firmly, but not rigidly, near the butt, with the full hand, and, standing with his left foot advanced next to the table, rests the cue at about 8 inches from the point on what is technically termed a bridge, formed by resting the wrist and ball of the left hand flatly on the table, as also the tips of the four fingers, somewhat expanded, with the knuckles elevated, and with the ball of the thumb placed against the forefinger midway between the knuckle and the first joint. Between this knuckle and the thumb, as on a *point d'appui*, the cue is made to play horizontally so as to strike the ball of the player with any degree of force and at any angle of its surface which is required, in order to cause it to assume certain lines of progression, before and after striking either the ball or the cushion at which it is aimed. The game consists in striking one of the other balls, at which the striker aims with his own ball, in such manner as to force that ball or those balls—for in different games various numbers of balls are used, in various combinations—into one of the pockets; or to force the striker's ball to ricochet from the 1st to the 2d and 8d ball, if it be in the 4 ball game, successively; or, in some cases, to force the striker's ball to ricochet from the ball stricken into one of the pockets—this point being in some games a losing, and in others a winning point. Billiards is a game

requiring a quick and sure eye, a steady hand, great delicacy of touch and flexibility of wrist, a quiet, easy, and patient temper, considerable power of mentally and instinctively calculating the angles at which a ball is deflected from a plain or convex surface, and the force required to effect the object; and lastly, immense practice, without which all the rest are nothing. Indeed, so constant are the attention and practice requisite to form a first-rate player, that none but men of leisure can hope to become such, and even with them it is time thrown away. The principal games played at billiards, are the English, or 8 ball; the American, or 4 ball game; the Russian, the Spanish, and the pool games; in all of which the principle is identical, though the combinations vary. Billiards is played more or less by all civilized nations, but is most popular with the Spaniards, Russians, and Americans.

BILLINGS, JOSEPH, an English navigator in the service of Russia, lived at the end of the 18th century. He accompanied Cook in his last voyage, and was intrusted with the astronomical department. In 1785, Catharine II. took him into her service, and sent him on a voyage of discovery. His instructions were, "to determine the latitude and longitude of the mouth of the Kolyma river; to describe the situation of the promontory of the Tchouktchees to Cape East; to trace an exact chart of the isles of the Pacific to the coast of America; in short, to complete the knowledge of the seas situated between Siberia and the continent of America." He set out overland in Oct. 1785, reached Kolyma, and put to sea in 1787. The expedition consisted of 2 vessels. It sailed toward the Arctic ocean, went 5 leagues beyond Cape Baranov-Kamen, and returned to the Kolyma, whose course they explored up to Yakootsk, which they reached Oct. 22. At Okhotsk, on the Pacific coast, they built 2 ships for the American expedition. Billings started anew, Sept. 1789, lost 1 of his ships, and cast anchor at the port of Petropaulovski, where he wintered. In March, 1790, he set out to visit the islands on the south of Alaska, on the N. W. coast of America. On the 24th he saw the island of Amtchitka; on June 1, he landed at Oonalaska. Billings examined into the manners and ideas of these islanders, and determined the latitude of Oonalaska. On June 18, he left it, and traversed the islands of Oonemak and Sannagh. He reconnoitred the Shoomagin group, and then visited the group called Evdokeef. On the 27th he described the mountains of Kodiak, and 2 smaller islands. He cast anchor at Kodiak, and described it and its wild inhabitants. July 8, he touched at Afognak. On the 11th he touched at the Ladenaia-Reka, or Icy river, perpetually frozen. On the 19th he penetrated into Prince William's sound, and cast anchor where Cook had been in 1778. He examined Cook's strait thoroughly. His provisions now began to run short, and not having means to winter in these savage regions, he deter-

mined to return to Kamtchatka. Billings's voyage lasted from 1787 to 1791. An account of it was published in English, at London, in 1802.

**BILLINGS, WILLIAM**, the father of New England psalmody, born in Boston, Oct. 7, 1746, died there Sept. 26, 1800. He was by trade a tanner, and his opportunities of instruction in any branch of knowledge, and particularly in the theory and practice of music, were few. A love of music and considerable vocal skill, however, led him while still young to become a teacher of singing and a composer of psalm tunes, which eventually found their way into every church choir of New England, and became great favorites with the people. He published no less than 6 collections of tunes, which, with a few exceptions, were of his own composition. They were founded upon the new style of church music, then first introduced by Tansur, A. Williams, J. Arnold, and other English composers, and their contrast to the dismal old tunes previously in use naturally gave them immense popularity, and in fact caused a revolution in musical taste in New England. They were far from being perfect in the requisites of good melody and harmony, and their author, in a quaintly worded preface to his 2d work, entitled "The Singing Master's Assistant," and commonly known as "Billings's Best," apologizes for the errors which his first collection contains; but the melodies were generally good, and, had the composer enjoyed the advantages for musical instruction which the present age affords, his compositions would doubtless have possessed a permanent value. Billings was a firm patriot, and an intimate friend of Samuel Adams, who frequently sat with him at church in the singing choir. Many of his tunes, composed during the war of independence, breathe the true spirit of patriotism, and were sung and played wherever New England troops were stationed. Billings may fairly claim the title of the first American composer, for before his time there is no record of any musical composition by a native of this country.

**BILLINGSGATE**, the great fish-market of London. The quantity of fish that comes to this market is almost beyond belief. The "take" on the English, Scotch, Irish, and Dutch coasts, all finds a sale at Billingsgate, and is transported to London either by fishing boats or by railway, from the distant parts of the kingdom. The chief part of the fish consumption of England is supplied from Billingsgate, to which the article is first sent, as being certain of finding a sale at current prices. The market is under the control of a clerk and inspectors. The trade is conducted by salesmen, who are the agents between the wholesale dealers and the retailers; and the business is, as may be supposed, done at a very early hour, and with great rapidity. The congregation of a great number of individuals, all anxious for precedence, attentive and eager to secure their bargains, has given rise to fre-

quent altercations, seasoned with many personalities, and the use of much wit, more remarkable for readiness and pungency than for delicacy. Hence the term Billingsgate has been applied to abusive and vulgar language. In these days of refinement, the language or conduct of Billingsgate is not remarkably worse than that of any similar concourse.

**BILLINGTON, ELIZABETH**, an English singer, born 1769, died Aug. 25, 1818. She was the daughter of Weichsel, a German musician, and in childhood displayed such musical talent that she played her own composition in London, at the age of 11. She married her music-master, Mr. Billington, whom she accompanied to Dublin, where she made her first appearance on the stage. She remained there until 1786, when she returned to London, but meeting no success she went to Paris and took lessons from Sacchini, by whose advice she visited Italy in 1794, to perfect herself in her art. She lost her husband in Italy, and married a second time at Lyons. On her return to England in 1801, she charmed the musical world with her accomplishments, and was engaged and sang at both Covent Garden and Drury Lane theatres at the same time. Her husband left England in consequence of the alien act, and she followed him in 1817, and died at St. Artien near Venice.

**BILLITON**, an island of the Malay archipelago, separated by the Carimata passage from Borneo, and by Gaspar straits from Banca. Its highest peak, near N. E. point, which is 2,800 feet high, is in lat.  $8^{\circ} 13' S.$ , long.  $108^{\circ} 7' E.$ ; area 1,944, and including 58 inconsiderable adjoining islets, 2,284 sq. m.; pop. of the island 8,000, of the islets 1,500. It is noted, like the neighboring island of Banca, which it resembles in geological formation, for its production of grain tin from alluvial deposits. Iron possessing strong magnetic properties, is found in abundance; and the peculiar white iron, called *pamor*, used in damasking the famous Bornean Dyak sword blades, is found here in small quantities, Billiton and Celebes being the only countries where it is found. Iron has been worked since an early period by the native Sikas; but the mining of tin did not commence till as late as 1850, by a Dutch company, of which Prince Frederic Henry, of Holland, is the chief stockholder. The island has been granted to the prince as a private property. It is the southern extremity of the great Malay tin district, which extends northward over  $17^{\circ}$  of latitude to Tenasserim, on the Malay peninsula. According to the various tests, by the crack of the metal, weight, and ductility, the tin of this island is the best in the world. The product thus far has not been made public; but the mines, in proportion to their extent, are said to be as productive as those of Banca. As in that island, Chinese colonies work the mines. The soil is generally sterile, and a large portion of the rice for the consumption of the miners is brought from Java and Bali. The aborigines, a

rude race, called Sikas, and much resembling the Bajaus or sea gypsies, subsist chiefly by fishing, and are accused of being ready to plunder a feebly manned trading prahu, or a stranded European vessel, whenever a favorable opportunity is presented.

**BILLOM**, a town of France, in the arrondissement of Clermont, department of Puy-de-Dôme, with 4,591 inhabitants. It is a town of considerable antiquity. Before the revolution it had a collegiate church, among the treasures of which were alleged to be a drop of the blood of Christ, and a piece of the wood of the true cross.

**BILLS OF MORTALITY**, the table of deaths occurring in a particular city or district. The London bills of mortality commenced in 1598, after a visitation of the plague, and were extended into weekly bills after a similar visitation in 1603. They were compiled from the returns of parish clerks, and long after considerable progress had been made in the system of preparing mortuary tables on the continent, they continued in a most unsatisfactory and unscientific condition. The establishment of a metropolitan police district, introduced the office and functions of the registrar-general. A new system of registering births, deaths, and marriages, was inaugurated in England and Wales, in 1839. The bills of mortality were abolished as such, and new metropolitan registration districts established.

**BILMA**, a town in the desert of Sahara, situated between 18° and 19° N. lat. and about 14° E. long., S. S. E. from Moorzook, N. N. E. from Bornoo. It stands in the centre of the oasis Wady Kawas, and on the route between Tripoli and Bornoo. It is inhabited by Tibboos, among whom are many negroes, whose northernmost limit of habitation this is. It owes its importance to being a stopping-place for caravans, and still more to the salt lakes in the neighborhood. The salt is gathered at the end of the dry season, when it is taken in sheets from the borders of the lake. It is then put into bags, and exported to Soodan and Bornoo. A coarser sort is made up in pillar form, quite hard, and also sent to Soodan. Dates are to be had here in abundance, but very little of other sorts of provisions.

**BILSON, THOMAS**, bishop of Winchester, born in Winchester in 1586, died at Westminster, June 18, 1616. He was one of the most learned men of his time. In 1596 he was consecrated bishop of Worcester, and the following year became bishop of Winchester, and was sworn of the privy council. Bilson published "The true Difference between Christian Subjection and Unchristian Rebellion," 4to, Oxford, 1585, and 8vo, London, 1586; "The Perpetual Government of Christ's Church," 4to, black letter, London, 1593; "The Effect of certain Sermons touching the full Redemption of Mankind by the Death and Blood of Christ," &c, 4to., London, 1599; "The Survey of Christ's Suffering for Man's Re-

demption, and of His Descent to Hades or Hell," fol., London, 1604. Bilson was held in the highest respect for his personal qualities, as well as for his great learning.

**BILSTON**, a market town of Staffordshire, England; pop. in 1851, 28,527. It is the centre of extensive coal mines, and of a large iron trade, the founderies being engaged in every kind of iron work. In the vicinity is a coal mine which has been on fire for 60 years. The sanitary arrangements are very defective, and the town is memorable for the dreadful severity with which the cholera attacked the population in 1832.

**BIMA**, the principal state of the island of Sumbawa, and seat of a Dutch residency. The Dutch fort at the head of the bay of Bima in lat. 8° 35' S., long. 118° 40' E. Before the eruption of the mountain Tomboro, situated at the extremity of the northern peninsula of the island, and which is the most terrific volcanic eruption on record, the inhabitants of Bima numbered 90,000 souls; and when a census was taken in 1847 there were only 45,000. The soil of this territory has not been found favorably adapted to the production of cereals, or other products for the sustenance of man. The surface of the land consists of a great number of trachytic ridges, which are separated by ravines often very deep, and of which the sides are frequently perpendicular; much resembling the almost fathomless clefts and fissures in the arid wastes of portions of the Tierras Calientes in Mexico. In these ravines run streams very impetuous in the rainy season, while their beds are nearly empty in the dry. The country is well situated for irrigation, and water is abundant for the purpose, which if applied as in the neighboring islands of Bali and Lombok, would evidently result in the same remarkable productiveness of soil; but the inhabitants of Bima are too feeble in character and too badly governed, to be induced to give such an intelligent direction to their labor. The chief productions which have attracted Europeans to this portion of Sumbawa are sandal, and aspan wood; and beeswax and horses are exported to Java. The horses of Bima are much esteemed in the Indian islands; they are not so large as those of Celebes, nor so hardy and useful as those of the Bashee islands; nor so sure-footed as the little ponies of Java, but in point of beauty and spirit, they are justly called the "Arab of the archipelago;" yet are considered inferior in blood to the Bedouin "coursers of the desert," not having his fine coat and head. The horse is only used for the saddle, and never by the natives for draught, in the plough, or wheeled carriages; and the mare only is used as a beast of burden. A fine Bima horse is worth \$50 in Batavia; but very good ponies of this breed can be purchased for \$10; and they are procured by Javanese traders from those who raise them, for half that amount in articles of trade. There are 2 other breeds of horses on the island; those of Tambora, and Gunung-Api, differing

essentially from those of Bima. The inhabitants of this territory speak a language which has been regarded by Crawford, Raffles, and other historians of the Indian islands, as distinct from the Malay or any other language of the archipelago. In the appendix to "Raffles' History of Java," a list of 46 Bima words, names of prominent objects in nature, of which 2 only are said to originate from the Malay, are adduced in proof of the entire originality of the Bima language; but an application of that rule, the interchangeability of consonants of one class, and transposition of vowels and syllables, which the growth of language seems to have generally observed, will show that nearly all of the words in Raffles' vocabulary are of Malay origin. Thus we find *dho*, man, sir, readily traceable to *dau*, in Flores, *tawu*, in Celebes, and to the *tuau* of the Malays. Again, *oi* water, apparently differing so much from the Malay, *ayar*; yet we can trace it to that source. In *ai* in Lombok, *wai* and *we* in Celebes, *er* in Java; and *awar* and *way* in many portions of Sumatra. *Dana* is certainly derived from the Malay *tanah*, earth; *cavi* from *babi*, hog; *dolu* and *telu*, from *teloor*, egg; *wadu* from *batu*, stone; and even *intara* from *bintang*, star; and *wot*, and *wigi*, from *gigi*, the teeth. There exists among the records of this people, relics of an ancient language, like the Kawi of Java, or the Sanscrit. The alphabet of this recondite language of Sumbawa is as follows: a, ch, ph, n, s, r, t, th, b, l, gh, j, p, d, w, m, ch, dh, bh, k, ng, rk, dh, h, kh, b, z, y, d, f, g, gn. There are 80 consonants, consisting of 7 labials, 4 dentals, 4 palatals, 4 gutturals, 4 nasals, 6 liquids, and 2 sibilants. The letters f and z are regarded by Dutch and English writers as a peculiarity not to be found in the language of any other people of the archipelago; but they have certainly overlooked the fact that the people of the island of Nias substitute f for p, like the Arabs, calling *pulo*, island, *fulo*; and the people of Timor have the f sound, as *fahi*, hog, from the Malay *babi*.—The Dutch fort of Bima is garrisoned by about 150 Javanese and Bughis troops and a dozen Europeans. There are not less than 6,000 Bughis settlers in the territory, probably 1,500 from Bali, 1,000 from Timor and Flores, and 20 Chinese traders.

**BIMBIA**, a river of western Africa, discharging its waters into the bight of Biafra. Numerous villages are built along its banks, governed by a chief under British protection.

**BINAB**, a town of Persia, province of Azerbaidjan, on the Sofi Chai, a stream which enters Lake Ooroomesyah from the westward; pop. 7,500. The streets are clean, the caravansaries good, and the town well supplied with water. Fruit is raised in the vicinity in great quantities.

**BINARY ARITHMETIC**, an invention of Leibnitz, for discovering the properties of numbers, and constructing arithmetical tables. Only one digit, 1, is used, and its removal one place to the left doubles its value. Thus, 1 sig-

nifies one; 10, two; 11, three; 100, four; 101, five; 110, six; 10,000, sixteen, &c.

**BINARY STARS** are those couples of stars which are observed to be revolving about each other.

**BINBIR-KILISSEH**, some ruins of ancient tombs in the pashalic of Karamania, Asia Minor, 20 miles N. N. W. of Karaman, supposed to occupy the site of Lystra, where the cripple was healed by Paul.

**BINDRABUND**, a town in Hindostan, pop. 19,776, under British dominion, on the W. bank of the river Jumna, about 85 miles N. N. W. from Agra. The Hindoos regard Bindrabund with much veneration, as the residence of the god Krishna during his youth. The old name of the town was Vrindavana (a grove of trees). Many pilgrims come hither to be cleansed from their sins in the sacred waters of the river. The town contains many temples, all dedicated to Krishna.

**BINFIELD**, a parish of Berkshire, England, the residence of the father of Alexander Pope. A tree is still standing, beneath which his "Windsor Forest" is said to have been composed.

**BINGEN**, a German town, pop. 5,100, in the grand duchy of Hesse-Darmstadt, opposite Rüdesheim, on the left bank of the Rhine, at the confluence of this river with the little river Nahe. A famous wine is produced upon the neighboring Scarlet or Scharlach mountain, and enjoys, under the name of Scharlachberger, a world-wide reputation. The approach to Bingen is attended with some difficulty for navigation by the so-called Bingerloch, or Bingen-hole, formed by a compression of the Rhine into a narrow strait, between towering rocks. High above them all soars the Mäuseturm, or the mice-tower, so called from the popular belief that Archbishop Hatto of Mentz, who used it as a granary for speculative purposes during times of famine, was gnawed to death there by mice in 969. According to another tradition, the original name of the tower was Mauththurm, or custom-house tower. This tower was in a very dilapidated condition until 1856, when it was restored. The picturesque aspect of Bingen is enhanced by the adjoining Rupertsberg, with the ruins of a convent, where St. Hildegard, of Sponheim, took up her abode in the 12th century. The Rochusberg forms an additional attraction. Upon its summit stands a chapel, which is annually visited by crowds of pilgrims. A picture of St. Rochus was presented to the chapel by Goethe. The same mountain exhibits the ruins of an ancient castle, where, in 1105, the German emperor, Henry IV., was imprisoned by his son. In the time of the Romans, Bingen was called *Vincum* or *Bingum*, and formed part of Belgian Gaul. The castle built by the Romans upon the Rochusberg bore, in the middle ages, the name of Klopp castle. The name of its principal tower is Drusussturm. Hence the name of Drususbrücke applied to the beautiful bridge over the river Nahe. The Ni-

belungenhort, or the treasure of King Nibelung, which gave the name to the celebrated German epic, known as the *Nibelungenlied*, was, according to tradition, sunk in the Rhine, not far from Bingen.

BINGHAM, SIR GEORGE RIDOUT, a British general, born 1777, died Jan. 8, 1838. He entered the army in 1793, and progressively advanced in different regiments, until he became lieutenant-colonel of the 53d regiment. He served through the peninsular war, and was knighted in 1815; he married in the preceding year. Sir George Bingham had charge of Napoleon Bonaparte on the way from England to St. Helena, where he remained several years, and was promoted to the rank of major-general, and colonel-commandant of the 2d rifle brigade. He appears to have conducted himself courteously toward the exile of St. Helena, who described him as "a well-disposed man," but so afraid of the governor (Sir Hudson Lowe) that he would not visit at Longwood, for fear of giving offence to his excellency. Napoleon said that "Lady Bingham could not speak French, but looked good-natured."

BINGHAM, JOSEPH, an English scholar and divine, born at Wakefield, Yorkshire, Sept. 1668, died Aug. 17, 1728. An unfortunate controversy, in which he took a prominent part, forced him to resign his fellowship at Oxford; he was, however, presented to the rectory of Headbourn-Worthy, in Hampshire. He soon after married, and his increased expenses forcing him to exert his abilities to enlarge his income, he published, in 1708, the 1st volume of "Origines Ecclesiasticae, or Antiquities of the Christian Church," which he completed in 10 vols. 8vo, in 1722. In 1712 he was presented to the rectory of Havant, near Portsmouth. In 1720 he was one of the many that were ruined by the South sea bubble.

BINGHAMTON, the shire town of Broome co. N. Y.; pop. in 1855, 8,818; situated at the junction of the Chenango and Susquehanna rivers, where the former is crossed by the New York and Erie railroad, 225 miles from New York, and 80 miles from Syracuse, with which city it is also connected by railroad. The Chenango canal also connects it with Utica. It is handsomely laid out, and is a prosperous and active place, containing, according to the census of 1855, 18 churches, about 50 stores, 6 newspaper offices, 2 banks, seminaries, &c., appropriate to its population. Water-power is furnished by the Chenango river, and the flour and lumber trade is extensively carried on. It was settled in 1787 by William Bingham of Philadelphia. Since the census of 1855, the whole town of Chenango, of which the village originally formed a part, has been included within the limits of Binghamton.

BINGLEY, the Garrick of the Dutch stage, born at Rotterdam in 1755, died at the Hague in 1818. An early passion for the drama caused him to abandon the commercial pursuits for which he was intended by his father. For

nearly 40 years he was at the head of his profession in Holland, excelling chiefly in tragedy, but performing also occasionally in comic parts. From 1796 to the time of his death he was the director of a theatre, and at the same time the principal attraction of his company, which performed chiefly at Rotterdam and the Hague.

BINGLEY, WILLIAM O., an English essayist and miscellaneous writer, was born in York, and died in London, March 11, 1823. Originally intended for the bar, he deserted it for the church. He wrote "Travels in Wales in 1798," the "Economy of the Animal Creation," which has been translated into French and German, the "Economy of a Christian Life," "Memoirs of British Quadrupeds," a "Dictionary of Musical Composers of the three last Centuries." He was a laborious and painstaking compiler.

BINGTANG, an island of the Rhio-Linga group, in the Malay archipelago. Mt. Bingtang, its highest peak, 1,368 ft. high, is in N. lat. 1° 4', E. long. 104° 28'. Rhio, the Dutch free port, is in lat. 54° 40' N., long. 124° 26' 30" E. Area of the island, 408 sq. m.; pop. with Rhio, situated on Tanjong Pinang, an adjoining islet, 15,000. The geological formation is granite, overlaid by cellular clay ironstone. Iron and tin are found, but not as yet extensively mined. The gambier plant (*uncaria gambier*), which produces terra japonica, is the chief product of the island. A large number of gambier plantations are cultivated by Chinese colonists, who cultivate black pepper at the same time; the refuse leaves of the gambier, after obtaining the coagulated decoction of commerce, being excellent manure for the latter plant. No less than 7,300 tons of gambier were exported in 1857 from Singapore; chiefly the product of Bingtang, Singapore, Batang, and neighboring islets of the group. This article is worth in the European markets of the archipelago from \$2 50 to \$3 the picul (133 lbs.) Other productions are cocoa-palm, durian fruit, much prized by the natives, caoutchouc, gutta percha, and damar. Many valuable timber trees are found on the island. The native Malaya, who are rude hunters and fishermen, like the *Orang Benua* of the Malay peninsula, are now outnumbered by the enterprising Chinese. The island is subject to the sultan of Johore, on the peninsula. The native chief is the descendant of a prince driven from Malacca by the Portuguese in 1511. Much mention is made of Bintão, as it is called in Portuguese chronicles, by Barros, Cauto, and Castañeda.

BINNACLE, formerly, even in Dr. Johnson's time, spelled Bittacle, probably a corruption of the French *boite d'aiguille*, needle-box, a case or box in which the compass and lights are kept on board ship. It is sometimes divided into 8 compartments, the 2 sides containing a compass, and the middle division a lamp. In order that the needle may not be affected, the binnacle is put together without nails or any iron work. On board iron steamers, it is an object of the first importance to

the safety of the ship to isolate the binnacle as completely as possible.

BINNEY, Amos, a patron of art and natural science, and a successful cultivator of the latter, born in Boston, Mass., Oct. 18, 1808, died in Rome, Feb. 18, 1847. He graduated at Brown university in 1821, and took the degree of M. D. in 1826. His health forbade the practice of his profession, and he engaged in mercantile pursuits with much success. In the midst of business, however, he never abandoned his early love for natural science, and to it he devoted all his leisure moments. Mineralogy and conchology more especially engaged his attention, though he explored in a general way the whole field of geology and zoology. He was one of the founders and most efficient members of the Boston society of natural history, and its president, 1843-'47. He accumulated the best private collection of works on natural history then in the country, which he opened freely to all naturalists; and indeed a resort to his library at one period was absolutely essential to the proper investigation of any important subject in zoology. He was elected a member of all the scientific societies in the country, and was active in the formation and promotion of the American association of geologists and naturalists. The 1st volume of its transactions was published at his instance, and mostly at his own expense, and was extensively and gratuitously distributed by him. He was the president elect of that body at his death. When a member of the state legislature he used his influence to sustain the geological survey of the state, and succeeded in having attached to it a commission for the zoological and botanical survey also, which resulted in the important volumes of Harris on insects injurious to vegetation, Emerson on forest trees, Storer on fishes, Gould on invertebrata, &c. He was a zealous patron of art as well as of science, and for the encouragement of American artists, had commissioned 8 or 10 of the principal painters and sculptors to execute works for him on subjects chiefly American, to be chosen by themselves, and without limit as to price. Several of these, as the *Noche Triste*, by Rothermel, "Storming of a Mexican Teocalli," by Leutze; "I Think," by Terry; "Catharine Parr," by Huntington, were completed. Having accumulated what he regarded as a competency to pursue his favorite subjects, it was his intention to devote the remainder of his life to the patronage of science and art. Being in impaired health, he proceeded to Europe for the purpose of invigoration, increasing his acquaintance, and acquiring other facilities for the furtherance of his objects. He died, however, at Rome, at the age of 44. His monument, by Crawford, is one of the principal objects of interest at Mount Auburn. He wrote many valuable papers on natural history, which appeared in the proceedings and the journal of the Boston society of natural history. But the subject which he selected for his special investi-

gation was the terrestrial mollusks of the United States, and their shells. He devoted many years to this subject, and beside his own extensive personal observations he interested others all over the union, and fitted out several expeditions to Florida, Texas, and other unexplored regions, to collect materials. He employed the best artists to delineate and engrave figures, intending to publish a work that should be unsurpassed artistically, and make it a gratuitous contribution to science. Just on the eve of publication he died, leaving directions, however, that it should be completed, and gratuitously distributed to scientific bodies and men of science interested in the subject. This was done by his friend Dr. Augustus A. Gould, of Boston. The work consists of 2 octavo volumes of text and a third of plates, and for fidelity and beauty will vie with any work of the kind that has been published in any country.

BINNEY, HORACE, a distinguished lawyer of Philadelphia, was born about 1780, and through a long and active life has identified himself with the best interests of that city. He was for many years director in the first bank of the United States, and acted as trustee in the arduous duty of winding up the affairs of that institution. He took no prominent part in national politics until the election of General Jackson; but he then came forward in opposition to that administration, and was elected to congress. In that body he immediately obtained a commanding position. Since his retirement from political life his most celebrated effort was the defending of the city of Philadelphia in the Supreme Court against the suit brought by the heirs of Stephen Girard. He stands at the head of his profession in Philadelphia.

BINOMIAL, the sum or difference of 2 quantities algebraically written, as  $a \pm b$ , or  $m \pm n$ . The binomial theorem of Newton is a formula by which we can instantaneously write down any power or root of a binomial without the labor of actual multiplication or extraction.

BINONDO, a native town near Manila, on the right bank of the Pasig; or, rather, it is now a suburb of the walled European city, having been annexed to it by a magnificent stone bridge, 411 feet in length. The bridge of Binondo is regarded as the most remarkable structure ever erected by Europeans in the Indian archipelago.

BINTULU, the name of a river and territory in the sultanate of Brunai, in Borneo. Mouth of the river, lat.  $8^{\circ} 18' 30''$  N., long.  $113^{\circ} 8' 15''$  E. It is one of the 21 large streams whose mouths can be observed in running down the N. W. coast of Borneo, from Cape Sampanmanjio to Cape Datu, but of which the course of not one is yet laid down in any published map. Since the establishment of Rajah Brooke on this coast, in Sarawak, Bintulu, along with several others of these Bornean N. W. water-courses, has been partially explored. Coal, of the same quality as obtained in Labuan, and in Banjar-massin, has been seen cropping out in many

places near the banks of the river. Iron and antimony ore have been found in many parts, and supposed to be fully as abundant as in Sarawak. The present exports are native camphor, beeswax, wood-oil, damar, agila, and goliga, or the bezoar stones, taken from the stomachs of monkeys, which products are brought to points on the river banks by the wild Dayaks of the interior, and exchanged with Malay traders for cloths and ornaments. No Europeans have yet attempted to develop the mining resources of the country. The Bintulu territory has no determinable area, being simply that portion of country immediately bordering on the river. The bar of the river has not more than 12 feet on it at high water, but, for vessels of this draught, it is navigable about 45 miles. The territory is thinly peopled by a few Dyak tribes.

**BIOBIO**, or **BROBIO**, the largest river in Chili, which divides Chili proper from the territory of the Araucanian Indians. It springs in the Andes from the volcano Tucapel, and flows into the Pacific. The Laxa runs into it on the right, the Vergara on the left. It is not navigable for any distance on account of its many reefs, rapids, snags, and other dangers. Its total course is about 200 miles.

**BIOERNSTAEHL**, **JAKOB JONAS**, a Swedish traveller, born at Rotarbo, in the former province of Södermannland, in 1781, died at Salonica in 1779. He was a graduate of Upsal, and a tutor in the family of a Swedish nobleman, with whose children he made the tour of Europe. Having studied the oriental languages at Paris, and published a work on the Hebrew decalogue, illustrated according to the Arabic dialect, he was made professor at the university of Lund, and sent by Gustavus III. on a scientific journey to the East, in the course of which he died of the plague at Salonica. An account of his travels appeared at Stockholm, in 1778, in 8 volumes, containing, among other things, anecdotes relating to Voltaire, whom he had visited at Fernay.

**BIOGRAPHY** (Gr. *βίος*, life, and *γραφω*, to describe), an account of the life and character of an individual. It differs from history, properly so called, in considering public and national events, if at all, only in their relations to a single personage. It assumes various forms, being sometimes most interested in the circumstances and external career, the *curriculum vitae*, of its subject; sometimes regarding chiefly intellectual and moral qualities and development; sometimes being hardly more than a catalogue of a man's positions and changes of position; and sometimes, like the autobiography of Goethe, fit to be entitled truth and poetry; sometimes being formally narrative throughout, but often presenting the hero also by his letters and notes of his conversation. A biography may be a panegyric or a diatribe, or the life of a man may be used as only a frame on which to attach moral reflections. Its true aim, however, is to reveal the personal significance of

those men who have played a distinguished part in the world, either by action or by thought. History has reference to the development of principles, biography to that of character. To observe the growth of a nation, or of any institution from the idea on which it was grounded, through its vicissitudes and conflicts, is the part of history. To trace a human life, to remark the manifold efforts, defeats, triumphs, perplexities, attainments, sorrows, and joys which fill the space between the cradle and the grave, is the province of biography. In history, Scipio at the head of the Roman legions subdued Africa, and Agesilaus struggled against the misfortunes of his country; in biography, the former is seen not only gaining victories, but also gathering cockle-shells on the shore, and the latter not only fighting after defeat, but also riding on a hobby-horse among his children. Plutarch says it does not follow because an action is great, that it therefore manifests the greatness and virtue of him who did it; but on the contrary, sometimes a word or a casual jest betrays a man more to our knowledge of him than a battle fought wherein 10,000 men were slain, or sacking of cities, or a course of victories. Xenophon remarks that the sayings of great men in their familiar discourses, and amid their wine, have somewhat in them which is worthy to be transmitted to posterity. As a branch of literature, biography seems to be nearly coeval with history itself. Some of the narratives of the Old Testament, those of Ruth and Joseph for instance, are biographies. The Odyssey of Homer is a biography of Ulysses, as the Iliad is a history of the Trojan war. Biographies were infrequent under the Greek and Roman civilization, when the individual was absorbed in the state. When Cincinnatus or Coriolanus is mentioned, we recall rather an act than a person. The elder Cato wrote a history of the Roman republic, in which there was not found a single proper name. He said simply: "The consul proposed such a law, the general gained such a battle." The chief of the ancient biographies are the lives of the Cæsars, by Suetonius; of the philosophers, by Diogenes Laertius; of the sophists and also of Apollonius of Tyana, by Philostratus; of the philosophers and sophists, by Eusebius; of great commanders, by Cornelius Nepos; of those illustrious for their learning, by Hesychius of Miletus; of Alexander the Great, by Quintus Curtius; of the emperors and illustrious Romans, by Aurelius Victor, also attributed to Pliny the Younger; and, above all others, the parallel lives of the greatest Greeks and Romans by Plutarch, and the life of Agricola by Tacitus. The *Cyropædia* of Xenophon is rather a political romance than a biography of Cyrus the Great, and the memoirs of Socrates by the same author were designed only as a defence of Socrates by presenting some of his teachings. Philosophers and military statesmen fill the list of the subjects of ancient biography, and their lives, with rarely an exception, do not exceed the ordinary length

of a review article at the present time.—The middle ages seldom made warriors or statesmen the subjects of biography, but were rich in biographical accounts of saints and religious heroes. Martyrologies bearing the name of *acta sanctorum*, *acta martyrum*, and *passiones martyrum*, became common, each church and monastery preserving an account of its own martyrs, all of which were subsequently gathered into vast collections. Dionysius of Alexandria wrote a history of the martyrs in that city; Cyprian, in his letters, gave an affecting account of the martyrs and confessors in the neighborhood of Carthage; Eusebius wrote a book on the martyrs of Palestine; Simeon Metaphrastes wrote lives of the saints, 122 of which yet remain; Prudentius wrote on the crowns and passions of martyrs; John Moschus wrote lives of the monks to the time of Heraclius, and several works of Gregory of Tours are biographies of men distinguished in the church. The earliest collections of these martyrologies were circulated under the names of Jerome and Bede. In the 13th century, a collection was made by Jacob à Voragine, and in the 14th, by Peter à Natalibus; but the most complete and elaborate works on this subject bear date since the revival of letters. All other lives of the saints have been thrown into the shade by the colossal undertaking of the learned Jesuits of Antwerp, under Dr. Bolland, assisted by the combined industry of the order, and by communications from all parts of Europe. The work was begun in 1643, embraces *acta sanctorum*, *quotquot toto orbe coluntur*, and extends to 57 volumes, but is not yet completed. Individual religious orders, in recording the lives of their own saints, have rivalled the erudition and industry of the Bollandists. Thus Mabillon is the biographer of the Benedictine order, Henriquez of the Cistercians, Monstier of the Franciscans, Siccum of the Dominicans, Van der Sterre of the Premonstransians, and Alegre of the Carmelites, whose work is entitled *Paradisus Carmeliticus Decoris*. Other biographical works on this subject are the lives of the saints by Baillet, Alban Butler, and Ulich, lives of the fathers of the desert by Arnaud d'Andilly, the *Anglia Sacra* of Wharton, John Fox's "Book of Martyrs," and the *Flos Sanctorum, historia general de la vida y hechos de Jesu Christo y de todos los Santos de que reza la iglesia Catolica*, by Villegas, published at Toledo, in 1591.—Since the revival of letters there have been few eminent persons whose biography has not been written, and hardly an eminent author who has not written biographies. An immense mass of literature, valuable sometimes chiefly for the materials furnished, at others more for the art and quality of the writer, is embraced under the French titles *Vies*, *Notices*, *Biographies*, *Mémoires*, *Eloges*, the German *Leben*, *Lebensbeschreibungen*, *Nekrologe*, *Ehrensäulen*, and the English "Lives," "Memoirs," "Biographies," "Biographical Notices," and "Biographical Dictionaries." Among the chief writers of individual in distinction from collective biographies are

Fléchier, Fontenelle, Marzeaux, L. Racine, Buirigny, De Sade, Voltaire, Boissy d'Anglas, Villemain; Jerusalem, Schröckh, Nicolai, Herder, Sturtz, Hirzel, Klein, Garve, Meissner, Niemeier, Heeren, Dippold, Luden, Varnhagen von Ense, Tiedge, Barthold, Pertz, Perthes; Warburton, Middleton, Boswell, Murphy, Robertson, Monk, Roscoe, Th. Moore, Sir Walter Scott, Southey, Lockhart, Talfourd, Carlyle, Lewes; Marshall, Sparks, Irving, Tuckerman, and many others. Of special value and interest are Fléchier's life of Theodosius the Great; Fontenelle's lives of the Academicians; Buirigny's lives of Grotius, Erasmus, Bossuet, and Duperron; the life of Petrarch by De Sade, a descendant of his Laura; the life of his father, the tragic poet, by L. Racine; of Descartes, by Baillet; of Voltaire, by Condorcet; of Fénelon and Bossuet, by Bausset; of La Fontaine and Madame de Sévigné, by Walckenaer; of Molière and Corneille, by Taschereau; of Kleist, Moser, Engel, and Teller, by Nicolai; of Ruhnken, by Wittenbach, and of Wittenbach, by Mahne; of Heyne, by Heeren; of the preacher Reinhard, by Poelitz; of Charlotte Dorothea, duchess of Courland, by Tiedge; of Seydlitz, Winterfeldt, Schwerin, Keith, Bulow, and Sophie Charlotte, queen of Prussia, by Varnhagen von Ense; of Cicero, by Middleton; the remarkable life of Dr. Johnson, by Boswell, written with the minuteness and fidelity of a mediæval chronicler, and rendering the subject of it better known to posterity than any other man in history; the life of Lorenzo de' Medici and of Leo X., by Roscoe; of Nelson and Wesley, by Southey; of Schiller, by Carlyle; the excellent biography of Franklin, by Sparks; of Christopher Columbus, by Washington Irving; and of Washington, by Marshall, Sparks, and Irving.—Biographies embrace often both the life and times of the subject, linking personal with political, ecclesiastical, or literary history. Such a method is necessary in the lives of kings, and, to a large extent, of statesmen. Other examples of such attempts are Jortin's life of Erasmus, Godwin's life of Chaucer, McCrie's life of Knox, and Villemain's work, entitled "Lascaris, or the Greeks of the 15th Century." Voltaire's history of the ages of Louis XIV. and Louis XV. contains biographical notices not only of the courtiers and politicians of those periods, but also of the writers, painters, musicians, and sculptors. Biography enters largely into the fuller histories of philosophy and literature. Thus in Hegel's history of philosophy, his own system furnishes the framework into which he sets in order all the philosophical thinkers of the world, and Villemain's history of the mediæval and later literature, is at the same time a biography and characterization of writers.—Perhaps the most interesting of modern biographies are the lives of literary men, presenting as they do the strongest peculiarities, highest qualities, and greatest sensitiveness of character. Admirable specimens of this kind are the lives of Sheridan and Byron by Moore, of Sir Walter Scott by

Lockhart, of Charles Lamb by Talfourd, of Sir James Mackintosh by his son, and of Francis Horner by his brother. The memoirs of Sydney Smith by his daughter are entertaining, and the genius and sufferings of Charlotte Brontë and her sisters make their story, as related by Mrs. Gaskell, of terrible interest. The life of Dr. Channing by his nephew, Wm. H. Channing, and of Margaret Fuller, by R. W. Emerson, W. H. Channing, and J. F. Clarke, are valuable contributions to American biography.—Collective biographies embrace the lives of the eminent persons of a particular period, as the present time, the middle ages, or antiquity, or of a particular country; or of a particular department, as the sciences, the arts, religion, politics, war, literature. France has produced the largest number of these works, especially during and subsequent to the era of the revolution. History, surcharged with facts, is obliged to sum them up, as it were, in a table of contents, and one way of doing this is to represent ideas and events under the formulas of the names of men. In a disorganized age cyclopædic systems were needed as a sort of artifice to bring into juxtaposition the elements of history which could not be compounded in any other way. Among these collections are the lives of famous men by Petrarch, Boissard, Perrault, and D'Auigny; of the popes from Peter to Nicholas I., by Anastasius, surnamed the "Librarian," who lived in the 9th century, whose work was revised and brought down by Platina to 1471, and by Passerinus to 1566; Bowyer's history of the popes, 1748-'54; Walch's compendious history of the popes from the foundation of the see of Rome to the time of the author, Leipsic, 1760; Ranke's history of the popes in the 16th and 17th centuries; a general history of ecclesiastical and sacred authors, by Cellier, in 25 volumes, and by Ellies du Pin, in 61 volumes; of "Protestant France," published by Haag; of the fathers of the church, preachers, and heretics, by Pinchinat and Pluquet; of the old French mineralogists, by Gobet; of great captains, by Brantôme and Chasteauneuf; of celebrated sailors, by Richer; of celebrated children, by Baillet and Fréville; of illustrious royal favorites, by Dupuy; of celebrated women, by Boccaccio, Rivisius, Lemoyne, Mlle. De Kéralio, and Madame Fortunée Briquet; of female philosophers, by Ménage; of women of gallantry, by Brantôme; parallel lives of some illustrious women, by Holberg; the women of the French revolution, by Michélet; of celebrated female sovereigns, and of the beauties of the court of Charles II., by Mrs. Jameson; of the queens of England and Scotland, by Miss Strickland; the female biographical dictionary, by Mrs. Sarah J. Hale; lives of the philosophers, by the venerable doctor Walter Burley, by Fénélon, Savérien, and Maigeon; of Greek poets, by Lefèvre; of Greek and Latin poets, by Voss, Fabricius, and Lanteiras; the dictionary of Greek and Roman biography and mythology, by William Smith; the lives of useful men, by the society Monthyon; of the

Provençal poets, by Jehan de Nostre Dame; of the troubadours, by Fauchet, La Ourne de Sainte Palaye, and Millot; of romancers and dramatic authors, by Parfait, De la Vallière, and Laborde; of musicians, by Laborde, Choron, Fayolle, Gerber, and Moore; of artists, by Fontenay and Füssli; of painters, by Vasari, Bellori, Orlandi, Pilkington, Houbraken, Felibien, Deschamps, De Piles, D'Argenville, La Ferté, Quillet, Zea Bermudez, Palomino, and Velasco; of eminent British painters, sculptors, and architects, by Allan Cunningham; of American painters, of the sculptor Greenough, and numerous biographical essays, by Henry T. Tuckerman; of engravers, by Gori, Basan, and Walpole; of architects, by Milizia, Pingoron, and D'Argenville; the dictionary of painters, engravers, sculptors, and architects, by Spooner; of men illustrious in the republic of letters, by Nicéron, in 42 volumes, Paris, 1729-'45; of French poets, by Goujet, Santreau de Marsi, Auguis, and Crapelet; of "learned Germany," by Meusel, continued by Ersch and Lindner, in 28 volumes, Lemgo, 1796-1884; a lexicon of German authors who died between 1750 and 1800, by Meusel, in 15 volumes, Leipsic, 1802-'16; lives of German poetesses, by Voss; of German female writers, by Schindel; of distinguished Germans, by Voigt, Weimar, 1824; lives of the remarkable men of the last 3 centuries, in 8 volumes, printed at Halle, 1802-'9; the German temple of honor, by Hennings, in 9 volumes, Gotha, 1809-'27; the theatre of men illustrious for learning, by Paul Freher, Nuremberg, 1688; the history of the world in biographies, by Böttiger, Berlin, begun in 1839; Schlichtegroll's obituary of the Germans, Weimar, 1808-'22, in 20 volumes, subsequently continued to the present time; the dictionary of mathematicians, astronomers, natural philosophers, chemists, mineralogists, and geologists of all peoples and times, designed to serve as a history of the exact sciences, by Poggendorff, Leipsic, 1858, of which only the first volume has yet appeared; of Hebrew and Arabic authors, by Rossi; of the Turkish poets, by Hassan Tcheleby; of Mexican biography, by Eguia; of Brazilian biography, by Pereira da Sylva; of the Scalds, or ancient poets of Scandinavia, by Graberg de Hemsö; of the writers of the Baltic provinces, Courland, Livonia, and Esthonia, by Recke and Napiersky; of "illustrious Europe," by Du Radier; the *Biografiskt lexicon öfver namakunnige Svenskarnä*, Upsal, 1835; Erslew's *Almindeligt forfatterlexicon for Danmark*, Copenhagen, 1845-'48; of illustrious Italians, by Tipaldo, Venice, 1843-'45, also by Mazzuchelli and Fabroni; of celebrated Spaniards, by Antonio, De Castro, Ximenes, and Quintana; of the distinguished Portuguese, by Machado; and Dutch and Belgians, by Foppens, Pacquo, and Burmann; the library of American biography, conducted by Jared Sparks; the medical biography by 60 physicians, Paris, 1820; dictionary of writers on medicine, by

Callisen, in 32 volumes, Copenhagen, 1829-'44; Dion's biographies of physicians; Thacher's American medical biography; lives of learned men, by Melchior Adam, 1705; lives and characters of the English dramatic poets, by Gerard Langbaine, London, 1698; *Biographia Dramatica*, by D. E. Baker, 1764; *Commentarii de Scriptoribus Britannicis*, by John Leland; *De Academicis et illustribus Angliæ Scriptoribus*, by John Pitts; *De Scriptoribus Hibernicis*, by Sir James Ware; Ward's lives of the professors of Gresham college; Wood's *Athenæ Ozonienses*, or account of the writers educated at Oxford; the worthies of England, by Thomas Fuller; Walton's lives of Donne, Herbert, and Hooker; the lives of the English poets, by Dr. Johnson; of the statesmen, men of letters and science of the reign of George III., by Lord Brougham; Lord Campbell's lives of the chief justices of England; the *Biographia Britannica*, London, 1747-'66 (2d enlarged edition, carried only to the 5th volume, 1778-'98); a biographical dictionary of eminent Scotsmen, by Robert Chambers, in 4 volumes, increased to 5 volumes in the last edition, 1856; Gilfillan's Scottish martyrs, heroes, and bards; Sprague's annals of the American pulpit; Wordsworth's ecclesiastical biography; Lodge's portraits of illustrious personages of Great Britain; and memoirs of eminent persons of the Georgian era.—The restoration in France was the signal for an avalanche of collective biographies, most of which were written with vigor and rancor, for political or personal ends. The first of these was entitled a biographical dictionary of the weathercocks, the author of which is still unknown, which was quickly followed by lives of the ministers, deputies, peers, generals, prefects, commissaries of police, clergy, academicians, journalists, and men of letters. The most caustic and impertinent of these was the *Biographie des dames de la cour et du Faubourg Saint Germain*. Recently, under the name of galleries, there have been various collections of the biographies of statesmen, women, literary men, and artists, furnished with engravings, portraits, and fac-similes; an example of this is Lester's gallery of illustrious Americans. The earliest dictionary of American biography was that of Belknap, in 2 volumes, 1794-'98. Eliot's New England biographical dictionary followed in 1809, and the latest and fullest work, devoted only to American biography, is that of Allen, the last edition of which appeared in 1857. The first example of a dictionary of universal biography, designed to embrace all men eminent in whatever department, time, or place, was that of Konrad Gesner, which was published in Zurich in 1545, and has been followed by the similar German works of S. Baur, Grohmann, Fuhrmann, Hirsching, Leidenfrost, and by that of Jöcher, continued by Adelung and others, in 11 volumes. The best German universal biographies are contained in their cyclopædias, as that of Ersch and Gruber, and the *Conversations-lexicon* of Brockhaus. The first French

universal biographical dictionary was that of Boissinière, the 8th edition of which appeared in 1645. It was followed by the famous dictionary of Moreri, in 1673, at first in 1 volume, but successively enlarged by Jean le Clerc, Du Pin, Drouet, and Goujet, till at its 19th and last edition in 1759, it extended to 10 folio volumes; by the critical dictionary of Bayle, which appeared in 1697, had 6 editions in folio, and a revised edition by Beauchot, in 16 volumes, in 1820; by the dictionary of Chaufepié, in 1750, designed as a supplement to that of Bayle; by that of Marchand, in 1758, and that of Ladvocat, of which there have been numerous editions and imitations; by that of the abbé Barrelet, in 1758, in 6 volumes; that of Chaudon, which, being continued by Delandine, reached at its 9th edition, 1810-'12, to 20 volumes; that of the abbé Feller, who called himself an anti-Chaudonist, and whose work has had several editions. The most voluminous of universal biographies, and one of the most important publications of the present century, is the *Biographie universelle*, by the brothers Michaud. It was begun in 1811, and had extended to 52 volumes, when it was concluded in 1828. Three additional volumes were then devoted to a mythological dictionary, prepared by Parisot. A supplement was added to it, 1834-'40, which made the whole work extend to 84 volumes. A new edition was undertaken in 1848, which is still in process. The most of the learned and literary men in France, from the beginning of the century, have contributed to the *Biographie universelle*. Among them are Chateaubriand, De Sacy, Anger, Benjamin Constant, Walckenaer, Beauchot, Sismondi, Malte-Brun, Guizot, Villemain, Cousin, De Barante, and Biot. The articles are written with vigor, sometimes with passion, and though there are considerable diversities of philosophical and political opinion in the different contributions, the general character of the work is highly conservative. Barbier, the learned author of the *Dictionnaire des Anonymes*, published in 1820 a critical examination of historical dictionaries, which is a useful accompaniment to the *Biographie universelle*. The *Biografia universale antica e moderna*, published at Venice, is an Italian version of the dictionary of Michaud, with valuable additions concerning the celebrated men of Italy. After the fall of the empire, political discussions were carried on through the medium of biographical dictionaries. Thus the royalist party published the *Biographie des vivants*, in 5 volumes, 1816-'19, which was answered by the liberal party from Belgium by the *Galerie historique des contemporains*, in 8 volumes, and at Paris by the *Biographie des contemporains*, in 20 volumes, in preparing which Jay, Jouy, Arnault, and Norvins took part. The latest of the French universal biographies is the *Nouvelle biographie générale*, by Hoefer (published by Didot frères), not yet completed, and which is distinguished both for learning and impartiality. The English

works of this kind are the biographical dictionary of Chalmers, in 32 volumes; the general biography of Aikin, in 10 volumes; the biographical dictionary of the society for the diffusion of useful knowledge; the universal biographical dictionary of Watkins, London, 1825; Rose's biographical dictionary, in 12 volumes, London, 1857, and the department of biography in Knight's English cyclopædia, 6 volumes. An imperial dictionary of universal biography is now in process of publication in Glasgow, edited by P. E. Dove, having in its list of associate editors the names of Prof. Nichol of Glasgow, and Prof. Francis Bowen, of Harvard university. The principal American work of the kind is Blake's biographical dictionary, in 1 large octavo volume, the 18th and enlarged edition of which appeared in 1856. There is also a convenient hand-book of universal biography by Parke Godwin, and a cyclopædia of biography, republished in this country by Appleton and co., under the editorial supervision of the Rev. Dr. Hawks. Some of the latest universal biographies contain accounts of living men, but there are also German works entitled *Zeitgenossen*, or Contemporaries, French biographies of the living, and English and American "Men of the Times," devoted only to contemporaries. There is a *Galeria de Españoles celebres contemporaneos*, edited by Cardenas and Diaz. Records of the distinguished dead of every year are also preserved in appropriate periodicals, as Longman's annual biography and obituary, the American almanac, the *Nekrolog der Deutschen*, published at Weimar, and the *Fædrelansk Nekrolog*, published at Copenhagen.

**BIOLOGY** (Gr. *bios*, life, and *logos*, doctrine), a term introduced by Treviranus of Bremen (1802) and used by Carus, Oken, Schelling, and other German philosophers, to denote the ultimate conditions of human life. It is now employed by some writers as synonymous with physiology.

**BION**. I. Of Abdera, a distinguished mathematician, and pupil of Democritus, lived in the 4th or 3d century B. C. He was the first who asserted that there were certain regions of the earth where the whole year consisted of but one day and one night, each 6 months long. II. Of Borystheneas, a Scythian philosopher, who lived in the middle of the 8d century B. C. His father was a freedman, and his mother a Lacedæmonian harlot. Because of some crime committed by the former, the whole family were sold for slaves, and Bion in consequence became the property of a rhetorician, who educated him and ultimately made him his heir. After the death of his patron, Bion went to Athens, and applied himself to the study of philosophy. Nor did he confine himself to the tenets of any particular sect, but embraced them all round in turn. He was successively an academician, a cynic, a sceptic, a stoic, and a peripatetic, and the effect of their jarring creeds on his moral and religious principles was just what might have been antici-

pated. For though a man of considerable intellectual acuteness, he was a notorious atheist, and utterly depraved, so much so indeed, that he even derided Socrates for having led a virtuous life. Bion was remarkable for the shrewdness and sharpness of his sayings. We shall give a few examples: "The miser," says he, "does not possess wealth, but is possessed by it." He asserts that "good slaves are really free, while bad freemen are really slaves." He assures us that "it is useless to tear our hair when we are in grief, for sorrow is not cured by baldness." III. Of Smyrna, a Greek pastoral poet, who flourished in the latter part of the 8d century B. C. On attaining manhood, Bion emigrated to Sicily, where a conspiracy was formed against him, and he was basely poisoned. The poems of Bion were chiefly pastoral, occasionally erotic. The fragments of them that are extant fully justify the eulogies of his admirer, Moschus. Their sentiments are tender and delicate; their style is copious, graceful, and polished. The best edition of the remains of Bion's poetry is that of I. F. Manso, published at Leipzig, in 1807.

**BIOT**, JEAN BAPTISTE, a French savant, born in Paris, 1774, has pursued knowledge with eagerness and success, until he has passed his 80th year. Astronomy, acoustics, optics, magnetism, electro-magnetism, and thermotics are indebted to his skilful experiments, and to his laborious and accurate calculations; and other departments of learning have not been left untouched. His highest success has been in optics. He was a companion of Arago in measuring the arc of the meridian; he experimented on the pendulum in the Scottish isle of Unst; he published in 1802 a book on curves of the second degree; in later years, a volume on astronomy and another on physics; and has contributed largely to various scientific journals, and to the annals of the learned bodies of which he is a member.

**BIPONT EDITIONS**, famous editions of the Latin classics, published in Bavaria in the city of Deux Ponts, whose name in German is Zwei-brücken, and in Latin Bipontium. The publication was begun in 1779, but after the French conquest was finished in Strasburg. The collection forms 50 volumes, in 8vo.

**BIQUADRATIC**, in algebra, signifies belonging to the 4th power, that is, to the square of the square.

**BIR**, a town of Asiatic Turkey, on the Euphrates; pop. about 5,000. It is a central point on the caravan route from Aleppo and Damascus to Persia and central Asia, at which the Euphrates is crossed in large boats.

**BIRBHOO**, or **BEERBHOO**, a district in the N. W. extremity of Bengal; pop. 1,040,876; area, 4,780 sq. m.; between 23° 32' and 24° 40' N., and long. 86° 25' and 88° 30' E. The district is mountainous, wooded, and full of jungles. Its principal productions are sugar, rice, and coal. Iron ore of excellent quality is found, but so mixed that it does not as yet pay to work it. The principal town is Soorie.

**BIRCH** (*Betula*) a genus of monœcious trees or shrubs, which have, as generic features, both sterile and fertile flowers in scaly catkins, 8 of each under each bract, with no involucre to the broadly winged nutlet which results from a naked ovary. The sterile catkins are long and drooping, formed in summer, remaining naked through the succeeding winter, and expanding their golden flowers in early spring, preceding the leaves. The fertile catkins are oblong or cylindrical, protected by scales through the winter, and developed with the leaves. The outer bark is usually separable in thin horizontal sheets, the twigs and leaves are often spicy and aromatic, and the foliage mostly thin and light. The birch and the alder (*alnus*) were classified in the same genus by Linnaeus in his later works, but are now generally regarded as distinct by botanists.—There are 19 recognized species of birch, for the most part lofty-growing and ornamental trees, found native in Asia, Europe and America, and almost all preferring the cold regions of the northern latitudes. The most widely extended of them is *B. alba*, or common white birch, a native of Europe, and found in America, near the coast, from Pennsylvania to Maine, which thrives in every kind of difficult and sterile soil, but decays where the ground is rich. It is found, though dwarfed in size, higher on the Alps than any other tree, approaches near to the icy regions of the north, and is almost the only tree which Greenland produces. It has a chalk-white bark, and triangular, very taper-pointed, shining leaves, tremulous as those of an aspen. It serves many purposes of domestic economy. The bark is employed by the Greenlanders, Laplanders, and inhabitants of Kamtchatka in covering their huts and in making baskets and ropes. An infusion of the leaves makes a yellow dye, and is also drunk like tea by the Fins; and the Russians and Swedes prepare from the sap of the trunk a fermented liquor resembling champagne.—The most graceful tree of the genus is the *B. pendula*, growing both in mountainous situations and bogs, from Lapland to the sub-Alpine parts of Italy and Asia. Its popular name is the weeping birch, and it is distinguished for its suppleness and the graceful bend and falling inclination of its long boughs. Its picturesque appearance, with its white and brilliant bark and gleaming, odoriferous leaves, makes it a favorite in parks and gardens.—The *B. lenta* or cherry birch, called also the mountain mahogany, from the hardness of its wood, has a dark, chestnut-brown bark, and abounds particularly from New England to Ohio, and on the summits of the Alleghany mountains. Its leaves and wood are aromatic; the latter also rose-colored, fine-grained, and valuable for cabinet-work.—The *B. papyracea*, or paper birch, is that from which the aborigines of America made the canoes with which they navigated lakes and rivers, and hence it is also called the canoe birch. It is a native of Canada and the northern United States, and is superior to all other

species for its tough bark, in paper-like layers, which is so durable that the wood of the fallen tree will rot entirely away, while the case of bark will be left sound and solid.—The *B. nigra*, the river or red birch, is an alder-like American species, with whitish leaves and reddish-brown bark, found from Massachusetts to the southern states. Barrel hoops are made from its branches, and its tough twigs are the best material for coarse brooms. The negroes also make vessels from it to contain their food and drink.—The *B. nana*, dwarf or Alpine birch, is a native of the Alps and of the mountains of Lapland. The Laplanders burn it on summer nights to drive off a kind of mosquito, and sleep in the fragrant smoke. It has been introduced into this country, and appears as a small shrub on the summits of mountains in Maine and New Hampshire, and in other frigid situations northward.

**BIROH**, THOMAS, D. D. an English historical and biographical writer, born in London, Nov. 28, 1708, died by falling from his horse, Jan. 9, 1776. By his own exertions he qualified himself for admission into the church, and having been fortunate enough to obtain an introduction to Attorney-general Hardwicke, he gained the favor of that afterward distinguished judge. He became secretary of the royal society. He published a great number of works. "Thurlow's State Papers," "Lives of Archbishop Tillotson and Hon. Robert Boyle," an edition of Milton's prose works, and the works of Raleigh, "A General Dictionary, historical and critical," and "A series of Biographical Memoirs," are among the most important of his publications.

**BIRCH-PFEIFFER**, CHARLOTTE, a German actress and dramatist, born at Stuttgart, 1800, whose father's name was Pfeiffer, married in 1825, Dr. Birch, of Copenhagen. She early displayed a passion for the stage, and for about 20 years she performed in the various theatres of Germany, made excursions to Petersburg, Pesth, Amsterdam, and other cities; in 1837, undertook the management of the Zurich theatre, which she retained until 1848, when she received an appointment at the royal theatre of Berlin. She is also a dramatist of great industry, and produces as many as 2 plays a year. Her last play, the *Trauschein*, or "The Certificate of Marriage," appeared in the early part of 1858. She has also written several novels.

**BIRD**, EDWARD, an English painter, born at Wolverhampton, April 12, 1772, died at Bristol, Nov. 2, 1819. His father, a house carpenter, apprenticed him in his 14th year, at Birmingham, to the business of painting and japanning. When his apprenticeship was ended, he went to Bristol, where he opened a drawing school. In his intervals of leisure, he made several designs and sketches, 2 of which, at the Bath exhibition, in 1807, were much admired, and sold for 80 guineas each. These were followed by a piece called "Good News," an ale-house scene, which made his name more widely

known. After this came "The Chorister Rehearsing," and "The Will." Soon after, he was elected member of the royal academy. In 1811 he commenced his best and most poetical work, Chevy Chase, after the battle, and Sir Walter Scott, who was consulted on the occasion, gave Mr. Bird some valuable information on the armor, costume, and local accessories. This picture was purchased by the marquis of Stafford for 800 guineas. Mr. Bird presented Scott with the original sketch. Bird's next picture, "The Death of Eli," was also purchased by the marquis of Stafford for 500 guineas, and the British Institution awarded it a prize of 800 guineas. "The Blacksmith's Shop," "The Country Auction," "The Gypsy Boy," and a few other pictures, kept Bird's name before the public. He tried historical and sacred subjects, but without success. "The Embarkation of Louis XVIII. for Paris, in 1814," was his last subject.

BIRD, GOLDBERG, M. D., an English naturalist, born in Norfolk, in 1815, died at Tunbridge Wells, in Oct. 1854. Educated for the medical profession, he obtained the prize for botany given by the apothecaries' company of England. In 1836, when he was only 22 years old, he was appointed lecturer on natural philosophy at Guy's hospital, and afterward included medical botany in his course. After long practice and marked success as a teacher, he abandoned his medical practice to follow his favorite studies more devotedly. In 1848-'9, symptoms of heart disease became evident, and he soon died.

BIRD, JOHN, an English astronomical mechanician, born in the year 1709, died March 31, 1776. He was originally a weaver in Durham; but having become acquainted with a watchmaker, had his attention directed to mechanics, and became a dial plate maker, effecting the divisions with great correctness. In 1740 he went to London, and was employed by Sisson in marking off the astronomical quadrants, and at last opened a workshop of his own. He constructed the large 8 foot mural instruments for Greenwich, Paris, Oxford, St. Petersburg, Mannheim, and Göttingen. He was the master of the celebrated Ramsden.

BIRD, ROBERT M. M. D., an American physician, author of several novels and plays, born at Newcastle, Del., in 1808, died in Philadelphia, in Jan. 1854. He was educated in Philadelphia, where he began the practice of his profession, and made his first literary ventures in the columns of the "Monthly Magazine" of that city. The most successful of his tragedies is the "Gladiator," which has retained its popularity upon the stage, and the principal character in which is one of the favorite personations of Mr. Edwin Forrest. His novels, published at intervals between 1830 and 1840, are chiefly historical romances, the scene of "Calavar," and the "Infidel" being in Mexico, at the time of the Spanish conquest; that of "Nick of the Woods, or the Jibbenainosay," being in Kentucky, at the close of the war of the revolution; "Peter Pilgrim," containing a minute description of the mammoth

cave in Kentucky, and the "Adventures of Robin Day" being the story of an orphan shipwrecked on the coast of Barnegat. They are marked by picturesqueness of description, and an animated narrative. After spending several years in cultivating a farm, Dr. Bird returned to Philadelphia as editor of the "North American Gazette."

BIRD, WILLIAM, an English composer, born about 1543, died in 1623. He was a pupil of Tallis, and in 1563 was chosen organist of Lincoln cathedral, which would seem to imply that he had early in life conformed to the doctrines of the reformed church, notwithstanding that he wrote and published, at various times during his long life, a great number of ecclesiastical compositions to Latin words, forming portions of the Roman ritual. In 1589 he was appointed gentleman of the chapel royal, a position which he appears to have held until his death. The number of his vocal compositions, chiefly sacred, was enormous; and his pieces for the organ and virginals were almost equally numerous. Among the latter is a collection of nearly 70 compositions in manuscript, known as queen Elizabeth's virginal book. The fine canon, *Non nobis, Domine*, which to this day is frequently sung in England, is a good specimen of his skill as a composer of sacred vocal music.

BIRD ISLANDS. There are several islands or clusters of islands so named. I. The most important cluster is one among what are called the Leeward islands of the Lesser Antilles. The Bird islands lie off the coast of Venezuela, and immediately N. of the gulf of Triste. They are so named from the immense numbers of birds that frequent them. They belong to the Dutch, and are settled only by a few fishers. II. The most important single island thus named is in the North Pacific ocean. It is a solitary rock rising out of the bosom of the sea, and has its name for the same reason assigned above. The Sandwich islanders had given this name in their language. It should probably be reckoned as one of the Sandwich group. It was discovered in 1788, by the captain of the Prince of Wales. It is in lat. 23° 6' N., and does not exceed one mile in diameter in any place.—There are also Bird islands on the coast of Ireland, Africa, Newfoundland, and in the Eastern archipelago.

BIRD LIME, a glutinous, viscid substance, of greenish color and bitterish taste, prepared by boiling the middle bark of the European holly (*ilex aquifolium*) or of the *viscum album*, or some other plants, as the mistletoe and other parasites, for some hours, then separating it from the liquid and leaving it for a fortnight in a moist cool place to become viscid. It is next to be pounded into a tough paste, well washed, and put aside for some days to ferment. Some oil or thin grease is to be incorporated with it, when it is ready for use. Its characteristic properties appear to identify it with the principle *glu* of the French chemists, which exudes spontaneously from certain plants. It differs from resins in being insoluble in the fixed oils.

Bird lime is so tenacious that small birds alighting upon sticks daubed over with it are unable to escape. It is used for this purpose and also for destroying insects. Large quantities of it were formerly exported from Great Britain to India, and it is now an article of import in England from Turkey.

**BIRD OF PARADISE**, genus *paradisea*, Linn; belonging to the order *passeres*, tribe *conirostres*, and family *paradisæida*. Seven species of the genus are described: *P. apoda*, Linn. *P. papuana*, Bechst. *P. rubra*, Vieill. *P. speciosa*, Bodd. *P. regia*, Linn. *P. atra*, Bodd. *P. seepennis*, Bodd. The genus is characterized by a bill, long, strong, with the culmen curved to the emarginated tip, and the sides compressed; the nostrils lateral and covered by short feathers which conceal the base of the mandible; the wings long and rounded, with the 4th and 5th quills equal and longest; the tail is of various lengths, even or rounded; the tarsi as long as the middle toe, robust and covered by a single lengthened scale; the toes very long and strong, the outer larger than the inner, and united at the base, the hind toe long and robust; the claws long, strong, much curved and acute; the sides of the body, neck, breast, tail, and sometimes the head, ornamented with prolonged showy feathers. These birds are peculiar to New Guinea and the neighboring islands; they are active and lively in their movements, and are usually seen on the tops of high trees, though they descend in the morning and evening to the lower branches to search for food, and to hide in the thick foliage from the heat of the sun. The food consists chiefly of the seeds of the teak tree, and of a species of fig; they also devour grasshoppers and other insects, stripping off the wings and legs before swallowing them; in confinement they will eat boiled rice, plantains, and similar food. Their cry is loud and sonorous, the notes being in rapid succession; the first 4 notes are said by Mr. Lay to be clear, exactly intoned, and very sweet, while the last 8 are repeated in a kind of caw, resembling, though more refined than those of a crow or daw.—The best known species is the greater paradise bird (*P. apoda*, Linn.), whose body is about as large as a thrush, though the thick plumage makes it appear as large as a pigeon; it is about 12 inches long, the bill being 1½ inch. The head, throat, and neck are covered with very short dense feathers, of a pale golden color on the head and hind part of the neck, the base of the bill being surrounded with black velvety ones, with a greenish gloss; the fore part of the neck is green gold, with the hind part, back, wings, and tail chestnut; the breast chestnut, inclining to purple; beneath the wings spring a large number of feathers, with very loose webs, some 18 inches long, resembling the downy tufts of feather grass; these are of different colors, some chestnut and purplish, others yellowish, and a few nearly white; from the rump spring 2 middle tail feathers, without webs except for the

first few inches and at the tip, and nearly 8 feet in length; the remaining tail feathers are about 6 inches long, and even at the end. The natives call this bird *Burung-devata*, or "bird of the gods," from which perhaps the common name is derived. The Malay traders, who first brought them from New Guinea, cut off the legs of these birds, and pretended that they lived in the air, buoyed up by their light plumage, never descending to the ground, and resting at night suspended from the trees by the long tail feathers; other fables, such as that they fed on the morning dew, hatched their eggs out between the shoulders, and came from the "terrestrial paradise," were added in order to increase the value of these beautiful birds in the Indian markets. From the nature of their plumage they cannot fly except against the wind; when the feathers get disordered by a contrary breeze they fall to the ground, from which they cannot readily arise; in this way many are caught; others are taken by bird lime, or shot by blunt arrows, or so stupefied by *cocculus indicus* as to be caught by the hand; when at rest they seem to be very proud of their beauty, carefully picking from their feathers every particle of dust; they are shy and difficult of approach. Batavia and Singapore are the chief ports whence these birds are exported to Europe; the Bugis of Celebes bring great numbers of them thither in their boats from New Guinea and the Artoo group. The whole bird is a highly coveted ornament for the heads of the East Indian grandees as well as for the bonnets of the civilized fair sex.—The *P. papuana*, Bechst., is a smaller bird, of the same general appearance, with the throat and neck before green; top of the head, nape, and neck ferruginous yellow; back yellow with a grayish tinge; breast, belly, and wings chestnut. This and the preceding species are said to fly in flocks, led by a king who flies higher than the rest.—The *P. rubra*, Vieill., is about 9 inches long, and principally characterized by the fine red color of the subaxillary feathers, and the absence of the elongated slender shafts.—The magnificent paradise bird (*P. speciosa*, Bodd.), is of a general rufous color above, and of a brilliant green below, with a tuft of beautiful yellow feathers on the hind neck, marked at the end by a black spot.—The king paradise bird (*P. regia*, Linn.) is about 7 inches long; it has the head, neck, back, tail, and wings purplish chestnut, with the crown approaching to yellow and the breast to blood-red, all with a satiny gloss; on the breast is a broad bar of brilliant green, below which the belly is white; the subaxillary feathers are grayish white, tipped with shining green; the middle tail feathers are spirally coiled, with the webs of a glossy green color.—The superb paradise bird (*P. atra*, Bodd.) has a black crest, with the head, hind neck and back of a greenish gold color, of a velvety appearance, and overlying each other like the scales of a fish; the wings a dull deep black; tail black, with a

blue gloss and even at the end; throat changeable violet; belly bright golden green; subaxillary plumes black and velvety, rising upon the back and resembling a second pair of wings.—The gold-breasted paradise bird (*P. scappensis*, Bodd.) is also crested; the top of the head, cheeks, and throat changeable violet black; fore neck and breast brilliant changeable green; back deep black, with a violet gloss; wings and tail black; the subaxillary feathers are long and black, with loose webs like those of an ostrich; on each side of the head are 8 long feathers, webless except at the end, where they are spread into an oval form.—The 12 wired paradise bird belongs to the family *upupidae*, and to the genus *epimachus*; it is a native of New Holland, and is distinguished by a splendid green band across the breast, by the silky softness of the white feathers below, and by 12 wiry appendages prolonged from them. No description can give any idea of the graceful forms and brilliant hues of the paradise birds; our own beautiful humming birds come nearest to them in fairy-like structure of their plumage, and in the gorgeous, metallic, and ever changing lustre of their colors.

BIRD'S-EYE VIEW, the aspect of a thing as seen from above, just as a bird is supposed to see objects on the earth when soaring in the air. This is a favorite mode of taking pictures of places, as a bird's-eye view of the city and harbor of New York. The phrase, to take a bird's-eye view of a thing is employed. It is sometimes used metaphysically to mean a cursory, not minute, mental glance at a subject.

BIRDS (*aves*), a class of vertebrate animals, distinguished from all others by certain peculiarities, and also by a combination of other characteristics, the union of which is not to be found elsewhere. They are biped, as are, also, certain mammalia; are oviparous exclusively, which no other class is; and are, with very few exceptions, covered with a feathered coat, adapted, more or less perfectly, for flight. They have frames penetrated through all their parts by air-cells that facilitate motion by increasing lightness. By means of external substitutes for organs of reproduction, usually called nests, they develop *ova* after excluding them. The last 2 peculiarities distinguish birds from all other animals. No others possess the same, or even similarly aerified structures, and none—though many, both vertebrate and invertebrate, are oviparous,—exhibit any corresponding resort to nests for the development of their eggs. All birds, without a single known exception, are biped, which, without being an exclusive peculiarity, is very nearly so. All, or nearly all, possess more or less perfect powers of flight. Even the few exceptions have certain rudimentary substitutes for wings, that are never so far completely developed as to become available. The families which constitute these exceptions are both small in number and varieties of species, and in regard to that of the individuals composing them. They

are all formed either for motion on the land, or in the water, exclusively. In all these instances the feathery coverings are incompletely developed, possessing a proximate resemblance to the hairy covering of certain land and water animals. The ostrich and the penguin may be named as typical of these 2 distinct forms of exception, both in regard to their inability to raise themselves into the air, and their exceptional hair-like plumage.—In the internal organization of the entire class of birds there are other and more noticeable anatomic peculiarities. Their skulls are without the sutures that are found in mammalia, forming consolidated bones. These are joined to the neck or spinal column by one single joint, so constructed as to give the most perfect freedom of motion in horizontal and lateral directions, without danger of dislocation or injury. In the place of teeth they have upper and lower jaw, forming unitedly the bills, which are composed of a hard horny substance. These subserve a similar purpose to the teeth, the place of which they take. In several families of birds the upper part of the bill is articulated with the skull. The parrots are familiar examples of this peculiarity of structure. More commonly the skull and upper jaw are united by means of an elastic bony plate, by the interposition of which the brain is admirably protected from injuries, to which it would otherwise be unavoidably exposed. The upper extremities of birds, analogous to the arms or forelegs of other animals, differ essentially in never being used as prehensile organs, or for motion in contact with the earth, as in walking or running. Their use is almost exclusively for flight, and they serve as the basis of their wings. The cervical vertebrae of birds are more numerous than those of mammals. In the latter their number is uniformly 7, while in birds there are never less than 10, and in some instances as many as 23. Their dorsal vertebrae are more fixed and limited in their motion than the cervical, and are usually 10 in number, rarely 11, and in some instances only 7 or 8. The pelvis in birds is a simple elongated plate, open below, terminated by the rump, which supports the tail-feathers. The breast-bone, or *sternum*, is, perhaps, the most noticeable feature in the bony skeleton of birds. It is also one of the most important parts of the osseous frame-work, as it forms the base for the insertion of the most powerful of the muscles of flight. Its prolongation or crest determines with infallible accuracy the degree of power of flight of its possessor, and is entirely wanting in those destitute of the power of raising themselves in the air. The merry-thought (*furcula*) should be here mentioned as another peculiarity to birds of flight, and wanting only in those not possessed of that power. The lower extremities of birds are employed for purposes of locomotion, for standing and roosting, and, in some birds, for obtaining food. Their bony

frame-work comprises a thigh-bone, 2 leg-bones, a metatarsal or ankle-bone, and the bones of the toes. The last vary in number, and terminate in nails, of greater or less importance in their animal economy, according to the habits of the family possessing them. The variations in the mechanism of the lower extremities are often very curious and striking. The birds which roost, and more especially those which are in the habit of standing long at a time upon one leg, are enabled, by the remarkable arrangement of the bones, and the muscles attached to them, to do either with very little effort or fatigue on their part. Not less interesting, and even more striking and curious in their variety and their peculiar adaptation to their several purposes, are the muscular and other integuments which cover the bony frame-work of all the members of the entire class. As might be expected, in birds of vigorous flight, we find the pectoral muscles presenting the greatest development. These are often found to exceed in weight and bulk that of all the others. The great-pectoral and the middle-pectoral are antagonistic forces, alternately depressing and elevating the wings, while the small pectorals, or third pair, aid materially in varying the manner and character of the flight. The muscles of the lower extremities vary greatly with the habits of the bird, and especially according to their being climbers, waders, swimmers, perchers, &c. A minute detail of the wonderful mechanism by which birds are enabled to perch or roost without any apparent effort to sustain themselves, or a full account of those by means of which are regulated the movements of the jaws, those of the neck, or of the tail, would exhibit most interesting evidences of a wonderful design in their adaptation to their several purposes, but would unduly extend the present article. Beside their muscular integuments, all birds have horny beaks and nails, a fleshy cere at the base of the bill, and scaly coverings to the lower extremities, wherever they are bare. Their peculiar covering, found more or less perfectly in the whole class, and in no other, is their plumage of feathers. In certain families, that of the ostrich for example, the plumage of feathers makes a remarkably close approach to the hairy covering of land mammals. In other families, such as the divers, the alcades, the guillemots, &c., the plumage more nearly approaches the furry coats of the otter and the seal. In the young of birds the proximate resemblance of their plumage to the hairy covering of mammals is even more marked. The limits of the present article will not permit the description, at any length, of the interesting changes in the color, and other characteristics of the plumage, that mark the age and gradual development of all birds, and which present a variety, in all respects, that is almost beyond conception. Nor can we describe, in full, the very peculiar and curious glands by means of which birds dress

their plumage and protect it from the inclemencies of the weather. The bills of birds are yet another peculiar feature with the class that should not be omitted, though all the varieties of contrivance by means of which they discharge the duty of supplying food are also beyond the limits of this article. These enable the raptorial families to tear their prey into fragments; they supply to the fly-catcher, the swallow, and the whip-poor-will, most exquisitely contrived insect-traps; they give to the woodcock, the snipe, and other waders, the power of determining what is suitable for food with no other aid than the most delicately sensitive nervous membranes of their long probe-like jaws.—In birds, the alimentary canal comprises an oesophagus, a crop, a membranous stomach, a gizzard, an intestinal canal, and a cloaca, in which the urinary ducts also terminate. The gizzard is a powerful organ in promoting digestion, especially with gallinaceous and other graminivorous birds.—That peculiarity of structure, however, which more than any other, distinguishes this from every other class of animals, is the immediate and constant connection of the lungs with numerous air-cells that permeate the entire frame, extending even throughout the bony portions. These membranous air-cells occupy a very considerable portion both of the chest and of the abdomen, and have the most direct and uninterrupted communication with the lungs. The long cylindrical bones are so many air-tubes. Even the flat bones are occupied by a cellular bony network, filled with air. The large bills in certain genera, even the very quill feathers when fully developed, receive more or less air from the lungs, at the pleasure of the birds. By these means the erectile crests of a number of species are alternately depressed or elevated. The design of these wonderfully contrived chains of air-cells, penetrating into every portion of the structure of birds, is too obvious to require an extended explanation. Lightness of the body for motion in the air or water, or on the land, is indispensable. Hence we find, in birds of the highest and most rapid flight, the largest supply of air-cells. This pneumatic apparatus is also supposed to assist materially in the oxidation of the venous blood, and the air contained in the cells is presumed to operate upon the blood vessels and lymphatics in contact with them. The volume of air which birds are thus enabled to introduce into their bodies, the ease and power with which they can, at will, expel it, taken in connection with their peculiar organs of voice, satisfactorily account for what would otherwise be inexplicable; explaining how some of the smallest members of the class, the common canary bird, or the black-poll warbler of North America, for instance, are enabled to give utterance to such powerful notes, and to continue them so long without any apparent effort. The construction of the larynx in this class is a very peculiar one, bearing a remarkable resemblance to certain wind instruments. This

organ is made up of 2 parts, the true *rima glottidis*, at the upper part of the windpipe, and the bronchial larynx, which is furnished with a peculiarly tense membrane, performing the same duty as the reed in a clarinet.—The large proportionate development of the brain and of the nervous system of birds is another distinguishing feature of their organization. In many cases they exhibit an apparent superiority to the corresponding organs in mammalia of the same relative size and weight. Thus, for instance, while in man the size of the brain, in proportion to that of the whole body, varies from  $\frac{1}{15}$  to  $\frac{1}{12}$  part, that of the common canary bird is  $\frac{1}{10}$ . There are, however, great variations in regard to the size of these organs in different families and even in different genera of the same families. Thus, while the brain of the goose is  $\frac{1}{18}$  of the entire body, that of the eagle is  $\frac{1}{15}$ , and that of the common European sparrow is  $\frac{1}{12}$ . It differs chiefly from the same organ in mammalia, in the presence of certain tubercles corresponding to the *corpora striata* of other animals, and the absence of several parts found in the brains of the latter.—The senses of sight, smell, and hearing, are supposed to be most acute in a large proportion of the families of the class, much more so than that of taste, which is found well developed in only a few families, and still more than that of touch, which is presumed to be totally wanting. The organs of sight are of great proportionate magnitude, and occupy a large proportion of the cerebral developments. They are constructed with a wonderful contrivance not inaptly compared with so many peculiar kinds of "self-adjusting telescopes." They are also all provided with a very curious apparatus called the nictitating membrane. This is a fold of the *tunica conjunctiva*, so arranged as to be capable of being drawn out to cover the eye like a curtain, and to be withdrawn at will, enabling the possessor to meet the brightest rays of the sun undazzled by its brilliance, and protecting the organ from injuries.—With only a few exceptions birds have no external organs of hearing corresponding to an ear. We find instead an aperture that is called *meatus auditorius*. The internal membranes of this organ are connected with each other by means of the air-cells of the skull and have but a single auditory bone.—Among different authors there is much diversity of opinion in regard to the development of the sense of smell in birds. The experiments of Audubon and Bachman would seem to prove that, even in those families in which this sense is presumed to reach its highest point of perfection, the members are directed by sight rather than by smell to their prey. Still it is quite certain that they possess certain nervous developments corresponding to olfactory organs, which, if not designed for smell, possess no very apparent purpose.—The sense of taste has a limited degree of development in a few families, such, for instance, as the divers, the waders in part, and

the several families of humming birds, honey-suckers, and a few others. As a general rule it is very imperfect, or even wholly wanting.—The various contrivances and instinctive expedients, by means of which the entire class of *aves* develop the germs of their mature or perfect *ova*, are remarkable as well as distinguishing features in the economy of their propagation. They are peculiar to the class, and are without any known exceptions. They are shared with them by no other class of animals, with only occasional but remote approximations, apparent exceptions rather than real. Every individual of the entire class deposits the matured egg without any distinguishable development of the young bird. Lightness and buoyancy of body, whether for flight in the air, or for freedom of motion on land or in water, are essential pre-requisites in the animal economy of all the various families of the class. So, to nearly the same extent, is also their abundant reproduction. The vast numbers of their enemies, and the many casualties to which they are exposed, render a large and constant propagation necessary for their preservation. It is quite evident that any habit at all corresponding with the gestation of viviparous animals would be inconsistent with both of these requirements. It would destroy lightness of body, prevent freedom of motion, expose to innumerable dangers from enemies, hinder from procuring food, and make fecundity an impossibility. Thus, the common quail or partridge (*ortyx Virginiana*) of the Atlantic states, has been known to have 86 eggs in a single nest. Before maturity the product of this nest exceeds in weight their parent at least 20 fold. To provide for these or but one of them, by internal organs of development, would be impossible. Yet how simply, how perfectly, and how beautifully are all these requirements met by means of external substitutes. The nests of birds correspond with them in their duties and uses, to the uterine organs of reproduction of mammalia, and yet more to the marsupial pouches of certain Australian quadrupeds. They serve as external organs indispensable to the development of the immature young, from the first appearance of the germ in the egg, to a maturity more or less advanced, and varying greatly with the family; from the ostrich that comes into the world able to shift for itself from the very shell, to the blind and naked offspring of other families that are utterly helpless when first hatched. For this development of the young birds there are two essentials—the external receptacle which, though not always with exactness, we call nests, and the application of a certain nearly fixed or uniform amount of calorific. In nearly all cases the latter is generated by contact with the bodies of the parent birds. In some it is aided by the heat of the sun. In a few instances this is effected by heat derived from vegetable decomposition, or from the sun's rays, without any parental intervention after the deposition of the egg.—

Attempts have been made, with some partial success, to classify the various architectural contrivances, or their substitutes to be found connected with the nesting and incubation of birds. The most recent and most nearly successful attempt to systematize the subject is that of Prof. James Rennie of King's college, London. To this the present article will nearly conform, giving, where practicable, indigenous representative examples and supplying the more noticeable deficiencies of that arrangement. In this system the entire class are ranged in 12 groups: miners, ground-builders, masons, carpenters, platform-builders, basket-makers, weavers, tailors, felt-makers, cementers, dome-builders, and parasites. The objections to this arrangement are, that it is imperfect in itself, and that it corresponds with none of the usual systems of ornithological classification. The large number of species which, without being miners or carpenters, invariably occupy for their nests corresponding sites, namely, holes in the earth or hollow trees, have no appropriate place. Some of these have been improperly classed as parasites. Nor is there a well-defined place for the large variety of species belonging to every order, which resort to the bare ground, making no perceptible nest, or for that remarkable family of Australian birds, the mound-builders, which combine something both of the miner and the ground-builder. It seldom if ever conforms, in a single family even, with any known classification. Thus, the hawks are platform-builders, ground-builders, occupants of hollow trees, &c. The swallows are miners, cementers, dome-builders, masons, &c., and so on. The mining birds compose a very large group, belonging to nearly every order, and having no other common peculiarity. They may be divided into 2 well-marked subdivisions: the true miners, which excavate holes for themselves, in which they construct their nests, and those which, without mining, occupy sites precisely similar. Of these a portion are supposed to be parasitic, availing themselves of the labors of others. Among the true miners may be named the common bank swallow, found nearly throughout the habitable globe, the bee-eaters of Europe and Asia, and the whole genus of *thalassidroma*, better known as storm petrels or mother Carey's chickens; as also the several genera of puffins, king-fishers, penguins, &c. Among the other class, miners only by occupancy, may be named the wood wren and the winter wren of North America, the black guillemot, and the burrowing owls of North and South America. The last are parasitic miners, occupying invariably holes dug by other animals. The ground-builders include by far the largest group of birds of every order, and nearly of every family, and cannot be defined with exactness. In it must be classed many which build no nest, others that do, or do not construct nests, according to circumstances, those which build on the ground usually, but frequently elsewhere, some that are usually

ground-builders, but at times true miners, like the sky-lark of Europe, &c. The night-hawks and whip-poor-wills of America make no nest, the former depositing their eggs upon the bare earth, always selecting a site corresponding in color to their eggs, the latter selecting dried leaves as better suited to the same purposes of concealment. A very large proportion of the shore birds, waders, gulls, &c., make use of the bare sand with only a slight excavation for a nest. Others of the same species are more pains-taking, and construct well-formed nests. The herring gulls usually build a slight nest on the ground, but, after having been repeatedly robbed by eggers, the same birds are known to construct large and quite elaborate nests in trees or on precipitous cliffs. The mound-builders of Australia (see BAUGH TUCKER) combine, in part, the habits of the miners with those of the ground-builders, in a manner peculiar to that remarkable family. Among the true ground-builders may be cited nearly all the vultures, the entire sub-family of *circidae* or hen-harriers, the *sonotrichia* or song sparrows of America, nearly all the waders, ducks, geese, swans, gulls, terns, &c., with more or less representatives in every order. The birds which, from their habits in nest-building, are classed as masons, are comparatively few in number of species. They are so called because they construct their nests, in whole or in part, with walls, coverings, barricades, &c., of mud or clay. Of this class the cliff swallow of North America is one of the most remarkable examples. The house swallows, both of Europe and America, the thrush and blackbird of Europe, the robin and the pewee flycatcher of North America, are among the most familiar examples. The species known among writers and travellers as the baker bird of South America may be given as the most skilful and remarkable of this class. This species constructs a nest in the most exposed situations, but at a considerable height, hemispherical, or in the form of a baker's oven, and hence its name. The opening of this nest is lateral, and is twice as high as it is wide, and the interior is divided into 2 chambers by a partition beginning at the entrance. The true carpenters are also a comparatively small group, consisting of those which excavate, by their own labor, holes for their nests in trees. Corresponding in the selection of the sites for their nests, but obtained without labor, are a yet larger number of species, that, for convenience, are grouped with them, some of which are also parasitic. The large and widely distributed family of *picidae* or woodpeckers are the most familiar examples of the carpenter bird. With them are also classed the toucans of South America, the tomtits, the wrynecks, and the nut-hatches. Among the more common examples of the birds which, without being true carpenters, resort to similar places for their nests, may be mentioned the sparrow-hawk, the blue bird, the purple martin, the white-bellied swallow, and the house wren of North Ameri-

ca, several species of owls, and many others.—The platform builders are a small but distinct class, whose architecture is well defined. In it are embraced most of the *falconidae* or hawk tribe, the wood-pigeons, the cuckoos of America, &c. All the eagles are true platform builders, and many of them construct elaborate and remarkable nests. The nest of the white-headed eagle is a massive structure, sometimes forming an exact cube, each side of which is 5 feet square. The martial eagle of southern Africa also constructs a large platform, said to be able to support the largest man. These nests are perfectly flat, with no other security against the eggs rolling off than the ever small number of the latter and the constant presence of one of the parents. The common passenger pigeon, the turtle dove, and the yellow-billed cuckoo of North America, are the most familiar examples of this class, as also, in Europe, are the wood pigeons, the ringdoves, the herons, and the storks. Another larger class, whose architectural accomplishments are even more remarkable, are the basket-makers. Many of these exhibit an elaboration and an ingenuity beyond the power of human skill to imitate. The vireos of North America weave a cup-shaped basket nest, pendant from some convenient twig, the leaves of which conceal them from enemies. The European bullfinch, the American mocking-bird, the red-winged blackbird, the yellow-headed troopials of North America, the ravens, crows, and magpies, and the cyanotis omnicolor of Chili, may be mentioned as among the more familiar or remarkable of this interesting group. The last-named bird attaches a nest of singular beauty and elaborateness to the stems of the large reeds of that country, constructed to resemble the ripened seed-vessels of the plant so closely as to deceive even the most wary. The locust-eating thrush of southern Africa builds a large basket fabric, containing many cells or separate nests, from 6 to 20 in number, the joint products of, and occupied by as many pairs. The pensile grosbeak swings its basket nest from a pendant twig over a running stream, and makes its entrance from the bottom. The sociable grosbeaks unite in the construction of a large, basket-like cluster of nests, sometimes containing 200 or 300 in a single structure. To describe all, or even a small portion of the varieties of this remarkable class, is beyond our present purpose or our limits. The weavers are closely allied to the preceding class, differing chiefly in their more pensile nests, and in the superior nicety of their structure. The weaver-oriole of Senegal is one of the most remarkable of this class. The Baltimore oriole of America, the Indian sparrow of southern Asia, the crested fly-catcher of southern Africa, and the yellow-hammer of Europe, are among the more familiar and distinguishing instances of the weavers. Hardly distinguishable from the 2 preceding groups are the few species classed as tailors. The orchard oriole of America is hardly entitled to be so classed, though usually quoted as a

true tailor. The best known instance is that of the *sykia sutoria* of the eastern continent, which sews a dead leaf to a living one, and between them constructs its tiny nest. The blue yellow-back warbler of America is another remarkable tailor, though its wonderful skill is as yet little known or appreciated. The felt-makers form quite a large and well-marked group of artificers among birds. These arrange the materials of their nests, though more loosely, in the same manner as that in which are put together the fibres of felt. These materials are, to all appearances, corded together. How this is done cannot be satisfactorily explained. The chaffinch of Europe, the goldfinch of America, the canary-bird, and the whole family of humming-birds, may be given as exemplifications of this peculiar and interesting group. The cementers compose a very small but well distinguished class, all the members of which, so far as is at present known, belong to the family of swallows. These birds secrete, from glands on each side of the head, a strongly adhesive glue, which is dissolved in their saliva, with which they unite the materials of their nests, and fasten them to their proposed sites. The chimney swallow of North America is the most familiar example of this group, while the esculent swallow of the East is the most remarkable. The dome-builders might without inconvenience be merged into the several groups of weavers and basket-makers. They consist of a large number of species belonging to a great variety of families, who construct covered nests, which are entered by holes in the side. These nests are more common in tropical countries than in cold. The marsh-wrens, several of the *sylicola*, among these the Maryland yellow-throat, the golden-crowned thrush or oven-bird, the meadow-lark, and the quail, of North America, are among the most familiar representatives of this group on this continent. In Europe it embraces the common wren, the chiff-chaff, the hay-bird, the wood-wren, the sparrow, the magpie, and the bottle-tit, among its best known members. The last group is one which it is not easy to classify. The true parasites, those which, like the cuckoo of Europe, the cow-blackbirds of North America, and its congener of South America, never rear their own young, but intrude their offspring upon strangers, always laying their eggs in the nests of other species, are a small but well-marked class. The larger number, which resort to the chosen sites of other birds, but build their own nests and rear their own young, are less clearly defined, because they are not uniformly parasitic in their habits. Of this latter class the house-sparrow of Europe as often makes its own nest as it seizes upon that of another species. Nearly or quite all of this class, usually marked as parasites, are so only occasionally, and by force of circumstances. The true members of the group are not many, and, so far as is at present known, are confined to the two genera, *cuculus* or true

cuckoos, and molothrus or cow-birds. (For the systematic classification of birds, and the history of the science, see OOMITHOLOGY.)

**BIRDS'-NESTS, EDIBLE**, the nest of the sea-swallow of the Malay archipelago, the lawit of Java, and *salangans* of the Philippines, *hirundo esculenta* of botanists. The bird is uniformly dark-colored, inclining to green on the back, and blue on the breast, has a short, strong bill, broad at the base, and is a little smaller than our swallow martin. It gathers from the coral rocks of the sea, a glutinous weed or marine fucus, which it swallows and afterward disgorges, and then applies this vomit, with its plastic bill, to the sides of deep caverns, both inland and on the sea-coast, to form its nest. When complete the nest is a hollow hemisphere, of the dimensions of an ordinary coffee-cup; when fresh made, is of waxy whiteness, and then esteemed most valuable; of second quality, when the bird has laid her eggs; and of third, when the young are fledged and flown. The lawit frequents mostly the deep, surf-beaten caves of the S. coast of Java, principally those of Karang Bollong (Hollow reefs), in the province of Baylen. These caves open at the base of a perpendicular face of rock, nearly 500 feet high, the mouths being from 18 to 25 feet in breadth, and 80 feet in height; within they continue to expand, until they attain the enormous dimensions of from 100 to 120 feet in width, and 450 feet in height, and for many hundred feet within the waves of the Indian ocean break with terrific fury. The collectors of the nests, like the Orkney gatherers of eider duck down, are lowered over fearful chasms, and move along a slippery foothold, at the risk of instant destruction. The collections take place in April, August, and December. The day previous to the descent into the caves, a *bimbang* or feast is given, *wayangs* or games in masks are performed, buffaloes and goats are killed, the flesh of which is freely distributed, and a pretty young Javanese girl is dressed up in peculiar costume, and personifies Nyai Ratu Kidul (the lady queen of the south), an imaginary personage, to whom offerings are made, whose assistance is invoked, and who must give permission that the collections shall commence, without which the collectors, though trained from infancy to the dangerous pursuit, cannot enter the caves. The Nyai is of course always favorable, when competent judges are assured that the right period for collection is at hand. These nests are also obtained in other parts of Java, and the islands eastward, on the coasts of Borneo, and in the limestone caves of the Philippines. The whole product of Java, and Netherlands India, in 1850, on account of the government, of which it is a monopoly, was 268  $\frac{1}{2}$  piculs, or 85,784 pounds, worth 560,884 florins, or about \$250,000, selling according to quality, at from \$5 to \$20 a pound; some of the finer sorts selling in Chinese markets for twice their weight in silver. It is well known that the edible nest is a whimsical culinary fan-

cy of the Chinese alone. They use it in the preparation of their most refined soups. Alone it has an insipid glutinous taste. A portion of the precious article is oftentimes, by way of ostentation on the part of a host, placed in a prepared dish of food already on the table, and in the view of the seated guests. The Chinese attribute to it peculiar strengthening qualities; but this sensual people chiefly prize it for its alleged properties as an aphrodisiac; and it is singular that this word is derived from the Greek word *αφρος*, "scum of the sea," which the gluten of this nest certainly is.

**BIRKBECK, GEORGE, M. D.**, a social reformer and the founder of the first mechanics' institute in England, born at Settle, Yorkshire, Jan. 10, 1776, died in London, Dec. 1, 1841. He early displayed a love for scientific pursuits; studied medicine in Leeds, Edinburgh, and London; was intimate while at the Scottish capital with the founders of the "Edinburgh Review," and was elected professor of the Andersonian institute at Glasgow. In Nov. 1799 he gave his first course of lectures at Glasgow, on natural and experimental philosophy. As there were no philosophical instrument-makers at Glasgow, he was obliged to have recourse to ordinary workmen to furnish his apparatus, and while explaining to them the uses of the instruments, he was struck with the idea of giving a gratuitous course of scientific lectures to the Glasgow mechanics. In 1801 he issued his prospectus for the establishment of a class solely for persons engaged in the practical exercise of the mechanical arts, men whose education in early life had precluded even the possibility of acquiring "the smallest portion of scientific knowledge." The first lecture was attended by 75, but so satisfactory was it to those who were present that at the 2d lecture the number was increased to 200, at the 3d to more than 800, and at the 4th to more than 500. In 1803 and 1808 the lectures were continued; in 1804 he resigned his professorship and quitted Glasgow; in 1806 he settled in London, where he obtained a good practice as physician. In 1820 he gave a gratuitous course of 17 lectures at the London institution. In 1823, a public meeting took place at the Crown and Anchor, at which he presided, and which Dr. Lushington, Jeremy Bentham, David Wilkie, and Mr. Cobbett, attended. The first officers of the "London Mechanics' Institution" were elected, and Dr. Birkbeck was chosen president. He continued his professional avocations, but to the last gave much time and labor to efforts for the education of the people.

**BIRKENFELD**, a principality of Oldenburg in Germany; lies on the left bank of the Rhine, in the valley of the Nahe, between Lichtenberg and the province of the lower Rhine; area, 148 sq. m.; pop. in 1855, 82,529. The soil is poor, though well cultivated wherever practicable. Its surface is covered with forests and mountains; it possesses iron mines and produces agates, chalcedony, &c., which are wrought for

exportation. It has a market town of the same name, pop. 2,900.

**BIRKENHEAD**, a market town and port of Cheshire, England, on the estuary of the Mersey, opposite Liverpool, with which it has constant communication by 3 steam ferries. It comprises the old extra parochial district of its own name, a part of Oxtan in Woodchurch, and the township of Claughton in Bidstone. A railway, 16 miles long, connects it with Chester, whence other roads diverge to various parts of the kingdom. Although a place of considerable antiquity, having been founded at least as early as the 12th century, it dates its present prosperity from a very recent period. Originally a poor fishing village, numbering in 1818 scarce 50 inhabitants, it grew with a rapidity seldom witnessed in the old world, until in 1851 its pop. was 24,285. This increase is mainly owing to its excellent docks, constructed since 1824. In that year large ship-building docks were erected on Wallasey-pool, on the N. W. side of the town, and in 1844 a series of splendid works, embracing a sea-wall from Woodside to Seacombe, docks at Bridge-end, a tidal basin 87 acres in extent and accessible at all times by vessels of 12 feet draught, and a basin of 16 acres for coasters, were commenced on the Mersey side. The plan was also made to embrace the construction of a dam to pen up the waters of Wallasey-pool into a float, which should communicate with the principal tidal basin. The first dock was opened in 1847. Warehouses, on a scale of corresponding magnificence, have also been erected.—The town is well laid out, well lighted, paved, and drained, and well supplied with water. The streets are remarkably wide and regular, the main thoroughfares, 5 in number, running nearly east and west, and the shorter streets crossing them at right angles. Hamilton square, on high ground near the river, is a beautiful public place,  $6\frac{1}{2}$  acres in extent, and planted with shrubbery. On Conway street, one of the principal avenues, is a public park, with an area of 180 acres, embracing flower-beds, plantations, lakes, and drives. A well-stocked market, 480 feet long by 181 feet wide, massive freestone slaughter houses, and model dwelling houses for the working classes, are among the other notable features of the town. There are 4 handsome churches of the established religion, a Scotch church, Roman Catholic and dissenting chapels; a theological school, established in 1846, to provide clergymen for Birkenhead, Liverpool, and neighboring places; an infirmary, a lying-in asylum, a dispensary, a mechanics' institute, and many free schools in connection with the different churches and chapels. There is no custom house, the entries being made at Liverpool. Manufactures are carried on with activity, and embrace pottery, varnish, boilers, guns, &c. There are also extensive ship-yards and iron foundries. The affairs of the township are managed by 21 elective commissioners. There were formerly

24, 3 of whom were appointed by the town-council of Liverpool, but in 1846 the board was constituted as at present.—A priory was founded here by Harris de Massey in 1150, and richly endowed. It was occupied by the royalists in 1644, and taken from them by the parliamentary troops. In 1848 it was demolished, and nothing now remains but a portion of the gable and one Gothic window, which formerly belonged to the refectory.

**BIRKENHEAD**, SIR JOHN, an English satirical and political writer of the 17th century, born at Northwich, in Cheshire, in 1615, died in Westminster, Dec. 4, 1679. He was educated at Oxford, and appointed secretary to Archbishop Laud; in 1642 he commenced the publication of the "*Mercurius Aulicus*" or court journal; this he conducted for 3 years, its contents being chiefly panegyrics of the king and court. He became in consequence an object of aversion to the parliamentarians, who persecuted him constantly during the commonwealth. At the restoration he was knighted and received several lucrative offices.

**BIRKET-EL-HADJI** (lake of the pilgrims), a small lake lying N. E. of Cairo in Egypt. It is a place of rendezvous for the pilgrims going over the isthmus to Mecca, and they return to that place to separate.

**BIRKET-EL-KEROUN**, or **KOORN** (lake of the horn), a lake in Fayoom, central Egypt, so named from its shape, or perhaps from the shape of the projecting spouts of a castle which stands on its banks; length about 80 m., greatest breadth 6. Its shores are bluff, except on the south side, where they are low and sandy. The lake communicates with the Nile and with the canal which popular tradition ascribes to Joseph the Hebrew. This lake has been supposed identical with the ancient lake Moeris, which has been thought to have been an artificial lake made by a king of that name. But the present Birket-el-Keroun is plainly a natural lake. It abounds with fish, and like Lake Moeris of old, is farmed out to fishermen, and is a source of revenue to the government.

**BIRKET-EL-MARIOOT** (Mareotis), a lake in lower Egypt, S. E. of Alexandria, once washing the southern walls of that city. It had been dry for several centuries. In 1801, the English united it by channel to Lake Aboukir, in order to obstruct the movement of the French garrison at Alexandria. Mehemet Ali has filled up the channel, and restored the old Alexandrian canal which communicates with the Rosetta branch of the Nile at Fona. It originally communicated also with the Canopic branch of the Nile. It merely left a narrow neck of land between it and the Mediterranean. On this neck Alexandria stood, and the lake served as a port for the craft of the Nile.

**BIRMINGHAM**. I. One of the most important manufacturing villages of Connecticut, situated in Derby township, New Haven co., on a commanding eminence at the junction of the Housatonic and Naugatuck rivers, 11 m. N. W. of

New Haven. It is neatly laid out, and contains a number of churches and schools, most of which face a handsome public square in the centre of the village. Its growth has been more rapid than that of almost any village in Connecticut: in 1840 it contained scarcely a dozen houses; in 1855 it had numerous manufactories, a bank, and about 2,500 inhabitants. The first pin factory in the United States was established here, and is still in successful operation. Rolling mills for copper, iron, and steel, factories of carriage springs and axles, bolts, augers, well chains, tacks, and other articles; lumber and coal yards, warehouses, and many stores, are among the evidences of the prosperity of the place. The value of the manufactures is about \$1,500,000 per annum. A bridge across the Naugatuck connects Birmingham with Derby, which is a station on the Naugatuck railroad, and the terminus of a line of steamboats plying between it and New York. II. A borough of Alleghany co., Pennsylvania, situated on the S. bank of the Monongahela river, about 2 m. above its confluence with the Alleghany. Although but a suburb of Pittsburgh, with which it is connected by a steam ferry, and a suspension bridge 1,500 ft. long, it has reached the dimensions of a flourishing and important town. It has several churches, and in 1857 had 1 manufactory of iron railing, screws, and machines; 1 of wagons, 1 of glass, 2 of cabinet ware, 1 planing mill, 1 pottery, and 4 breweries. Pop. in 1850, 8,742. The suburb of East Birmingham, with 1,694 inhabitants, adjoins it on the east.

**BIRMINGHAM**, one of the most important manufacturing towns of England, 112 miles N. W. from London; pop. 282,841. Situated nearly in the centre of England, and in the heart of a mineral district, Birmingham has for centuries been a place of some manufacturing importance. The impetus given in modern times to manufacturing processes by the discovery of steam, and by the improved methods of treating metallic ores, has raised Birmingham to the rank of one of the workshops of the world. It is now the seat of manufacture for every description of hardware and ornamental metal work. Beside metal works, a variety of other fabrics have been introduced, such as india-rubber, papier maché, mother of pearl, and other hard, though not metallic wares. The articles made chiefly come within the class of ornamental and furnishing goods. Outlery and tools never were made to any extent in Birmingham; and of late years, although Birmingham has maintained her position in the productions of goods made of brass and mixed metals, the iron and steel furnishing goods trade has found a favorable site in various towns of the surrounding district. If any one particular fact can, in the history of nations and cities, be assigned as a cause of prosperity or reverse, Birmingham, in common with many other towns of the north of England, owes her modern fame and advancement to James Watt. Watt found a patron for his great dis-

covery in Matthew Boulton, the spirited proprietor of the Soho works, near Birmingham, and became a partner in Mr. Boulton's establishment. Steam, which was, before long, to aid Britain in maintaining her supremacy against the world in arms, had its chief centre at Soho, which became the depot not only for Birmingham wares, properly so-called, but for machinery. Birmingham was the first place to feel the benefit of this accession of strength to the nation. The new power was at once introduced into all the manufacturing processes already established, and their prosperity led the way to an endless succession of inventions and adaptations. During the last 25 years, Birmingham has received a still greater accession of strength and prosperity in the railway system. A railway, "the London and Birmingham," was commenced in 1825, and opened in 1825. This (which is now the centre of the mighty "London and North-western," with its twenty-eight millions sterling of capital) at once concentrated upon Birmingham the traffic of the midland counties with London. Birmingham became the converging point of numerous lines of railways, which joined it with London on the south, with Liverpool and Manchester on the north, and with the east and west of England.—A mere list of the manufacturing processes carried on at Birmingham would require the whole space appropriated to this article. We will only mention brass and bronzed goods of every description, and every variety of excellence, including gas fixtures, stove ornaments, mouldings and cornices, curtain rods and rings, with countless small articles. Mixed metal goods, such as Britannia metal, queen's metal, alabaster, and electroplate, including dinner and tea services, spoons, salvers, and similar articles, plated goods which are considered inferior to the plated goods of Sheffield, japanned goods, both flat and hollow goods, papier maché in an infinite variety of articles for household or personal purposes of use or ornament. The elegant designs of these goods, and the fine pictorial ornaments with which the best goods are adorned, have given employment to some excellent artists. Mother of pearl, tortoise shell, and ivory goods, whether used as ornamental accessories, or as the principal fabric of the manufactured articles. Fire-arms in great numbers are made in Birmingham; during the last war, the British government was largely supplied by the Birmingham makers. To these may be added silver goods, thimbles, pencil cases, dressing case furniture, and a variety of small silver articles; small iron and wire goods, steel pens, pins, nails, screws, are also largely made. Castings were formerly very general in the manufacture of Birmingham goods. But the substitution of the die and stamping process, and of thin plates for the solid mass, enables the manufacturers to produce much cheaper and lighter goods. The difference in excellence between the two processes is not in question; the difference in cost

places stamped hollow ornaments within every one's reach. Casting is now almost exclusively confined to heavy goods. These manufactures give employment to large numbers of persons. —The political history of Birmingham is not important. It was an obscure village for centuries. The gradual increase of metal manufactures, for which its contiguity to the mines and smelting works gave it facilities, first called it into notice. The introduction of French tastes, and French ornaments, by Charles II., increased the activity of the Birmingham traders. The town is by no means remarkable for beauty. The public buildings are modern. The town hall, on the model of the temple of Jupiter Stator, at Rome, is a noble structure. It is of Anglesey marble. The hall itself is 145 feet long, 65 feet wide, and 65 feet high, and contains a grand organ, one of the finest in Europe, with 78 draw-stops, and upward of 4,000 pipes. This magnificent instrument, and the convenience of the great hall, bring together in Birmingham musical festivals of the first character. Among the other notable buildings are the royal free grammar school, the Roman Catholic cathedral and college, the school of design, and the market hall. There are several public institutions of an educational character: mechanics' institutes, literary societies, reading rooms, and libraries. It is one of the towns in which a government school of design has been established; and we believe that the Birmingham school is the best attended, and has been most successful. These schools are attended by pupils of both sexes, both juvenile and adults, in separate studios. The public schools are the royal free grammar school, a fine institution, and endowed with about \$40,000 per annum; the blue coat school, and, beside, the ordinary parochial schools. Queen's college, established in 1848, as its name imports, is of collegiate character, and grants degrees in art, laws, or medicine. There is also a college for Independents near Birmingham. There are several hospitals and institutions of a benevolent character; the general hospital, the queen's hospital, a Magdalen hospital, a blind institution, are among the chief.

**BIRNAM**, a hill in Perthshire, in the western highlands of Scotland, rendered famous by its connection with the history of Macbeth, and immortalized by Shakespeare. It was foretold to the ambitious thane, yet guiltless, except in thought, of bloody ambition, that, until Birnam wood should come to Dunsinane, his life and power could suffer no disaster. On the approach of Malcolm, with the avenging army, composed of the loyal clans, aided by Seward, earl of Northumberland, ignorant of the prophecy, the invaders cut down the boughs and bore them as leafy screens, by which to conceal their numbers, when the report of "the moving forest," marching upon Dunsinane, struck a fatal despair into the soul of the usurper. It has been remarked by an intelligent traveller in the highlands, that, if indeed there ever were a forest

on Birnam, Malcolm did his work of woodcutter very thoroughly; since it is now as bleak a heathery hill as any in Scotland, with scarcely a stunted Scottish pine or two, to mark the relics of the far-famed Birnam wood.

**BIRNEE**, Old, a town of the kingdom of Bornoo, in central Africa, 70 miles W. of Kooka, on the Yeoo; pop. about 10,000. It is said to have formerly had 200,000 inhabitants. The ruins of the stone walls by which it was enclosed are still visible.

**BIRNEY**, JAMES G., an American politician, born in Danville, Ky., Feb. 4, 1792, died at Perth Amboy, N. J., Nov. 25, 1857. He studied law, and removed early to Alabama, where he flourished in his profession and held the office of district attorney. Having had his attention turned toward the question of property in slaves, in 1838, he interested himself in the organization of a branch of the colonization society for the state of Alabama. Soon afterward, returning to Kentucky, he organized one there also, of which he became president. But, in 1834, his views rapidly advancing, he espoused the cause of immediate emancipation in a public letter, at the same time emancipating all his own slaves, about 20 in number. Making arrangements to establish a newspaper to disseminate these views at Danville, where he resided, and where he held the situation of professor in the university, he found it impossible to have such a paper printed in Kentucky, and removed to Cincinnati, where he began to issue the "Philanthropist." It had not been long published before it was found no less obnoxious to public sentiment in Ohio than it had been in Kentucky, and the press was thrown into the river. The editor, however, managed to revive it, and, in connection with Dr. Bailey, to make it a powerful instrument in acting upon the opinion of the state. About the year 1836 he went to New York, as secretary of the American anti-slavery society, and for many years devoted his time and strength to the furtherance of the objects of that society, by letters and articles from the press and by public addresses wherever he could make an opportunity to be heard. His purpose was to build up a political party upon the single question of slavery, to act upon the government within the forms of the constitution; and he succeeded in forming an organization in most of the northern states, under the name of the liberty party. During his absence in England, he was nominated in 1840 by that party for the presidency, but met with little success. He was again nominated in 1844, when he received more votes. It was charged upon his friends at the time, that, by withdrawing their votes from Mr. Clay, especially in the state of New York, they accomplished the election of Mr. Polk, thus aiming the death-blow at their own projects. Previous to this, in 1842, Mr. Birney had become a resident of Michigan, where he was disabled, by a fall from his horse not long afterward, from taking the active part in politics to which he

had been accustomed. The latter part of his life was spent at Perth Amboy, N. J.

**BIRON.** I. **ARMAND DE GONTAUT**, baron, a French general, born in 1524, died July 26, 1592. He was of an ancient family of Perigord, was educated among the pages of Margaret, queen of Navarre, and sister of Francis I., served in Piedmont under Marshal Brissac, distinguished himself during the religious wars in the Catholic army, fighting at the battles of Dreux, St. Denis, and Moncontour, and was created grand master of artillery in 1569. He was suspected by the court and the Guises of a secret inclination to Protestantism, and owed his safety on the eve of St. Bartholomew to his precaution in planting 2 culverins in front of his dwelling. He negotiated with the Huguenots the peace of St. Germain, received the baton of marshal of France in 1577, held various commands in Guienne and the Low Countries, was one of the first to recognize Henry IV., contributed to the victories of Arques and Ivry, and was killed at the siege of Eprenay. He was the godfather of Cardinal Richelieu. II. **CHARLES DE GONTAUT**, duke, son of the preceding, a French general of brilliant reputation, called the "lightning" of France, born in 1562, beheaded in the yard of the Bastille, July 31, 1602. His valor was distinguished at the battles of Arques and Ivry, at the sieges of Paris and Rouen, of Amiens and La Fère, and in the encounter at Aumale. He was made admiral of France in 1592; marshal, in 1594; governor of Burgundy, in 1595; duke and peer, in 1598; and was ambassador to the court of Elizabeth of England and to the Swiss cantons. Of inordinate vanity and ambition, ruined by losses at play and by prodigal expenditures, ungrateful to Henry IV., who had loaded him with favors and even saved his life in the engagement at Fontaine Française, he contrived with Savoy and Spain a plot for the dismemberment of France. His intrigues were discovered by the king, who pardoned him once, and even after he renewed his treason Henry was disposed to indulgence, provided he would confess and repent of his crime. Biron, however, persisting in denying every thing, was abandoned to justice, committed to the Bastille, and speedily judged, condemned, and executed. III. **ARMAND LOUIS DE GONTAUT**, duke, a French general, born at Paris, April 15, 1747, died by the guillotine, Dec. 31, 1793. He bore the title of duke of Lauzun till 1788. Surrounded by every advantage of birth and fortune, with a noble figure and cultivated mind, he passed several years in dissipation in England, Russia, Poland, and France, till he was hopelessly involved in debt. He left his property to his creditors; went with Lafayette to fight for the American revolution; returned to France, was elected deputy for the nobility of Quercy to the states general of 1789; declared against the court, and became the confidant and secret agent of Philippe Egalité. He served the republic in Corsica, Savoy, and La Vendée, but was, nevertheless,

condemned to death by the revolutionary tribunal for having favored the Vendéans, since he had not conquered them. The memoirs published in 1822, under the name of the duke of Lauzun, are of doubtful authenticity.

**BIRON**, **BIRÉN**, or **BÜHREN**, **ERNST JOHN**, a Russian adventurer, born in 1687, died Dec. 28, 1772. The grandson of a groom, and a groom himself, he found access to the household of Anna Ivanovna, niece of Peter the Great, and became her favorite and lover during her reign in Courland, and residence in Mittau. After Anna became empress, she took Biron with her to St. Petersburg, made him great chamberlain, and heaped honors and wealth upon him. He now adopted the coat of arms and the name of the celebrated French ducal family of Biron. As the favorite of the empress, he ruled absolutely over Russia. The princes Dolgoroucki, who, when Anna was made empress, kicked Biron out of her closet, and made it a condition that he should remain in Mittau, became the first victims of his vengeance. Executions followed each other, and in this manner thousands were murdered. Neither age nor sex was spared. Among his favorite cruelties was that of freezing his victims to death, ordering men and women to be put naked under the spouts of pumps in a temperature of—20° F. and even less. During the reign of Anna, the nobility of Courland, who a few years before had refused to admit his name in the rolls of their caste, frightened by his ferocity, elected him as their sovereign duke, his competitor being the celebrated Maurice of Saxony, the natural son of Augustus II. king of Poland, known as *Marechal de Saxe*, and as the victor in the battle of Fontenoy, who was supported by the interest of his father, and of Louis XV. Named by Anna regent of the empire, and tutor of her nephew and successor during his minority, the ambitious adventurer was suspected of a design to push aside his pupil, and to seize the imperial crown for his own eldest son, marrying him to the grand duchess Elizabeth, daughter of Peter the Great. His reign as regent lasted but a few months. As early as 1740, Field-marshal Münich, once his accomplice, secretly conspired against him, and on the night of Nov. 20, gave orders to seize him in his bed, and to put him in irons. He was shut up first in the fortress of Schlus-selburg, then after his condemnation to death in 1741, and the commutation of this penalty into exile for life, he was sent to Pelim in Siberia, 600 miles beyond Tobolsk, to a prison specially prepared for him by the orders of Münich. The princess Anna, mother of the infant sovereign, was proclaimed by Münich regent of the empire, but was in her turn overthrown in 1741 by Elizabeth, who becoming empress, sent Münich to Siberia, to replace Biron, whom she recalled from his prison and exile. The 2 antagonists, the one returning the other going, met in Kasan while changing post-horses, and exchanged looks but not words. Biron was ordered to reside in the city of Zarskawl.

When Peter III. succeeded Elizabeth, he recalled Biron to St. Petersburg, and Catharine II. subsequently restored to him his forfeited duchy of Courland. On Jan. 20, 1783, Biron entered his capital of Mittau. His rule was just and mild until his death.—He left 2 sons, the eldest of whom, Peter, succeeded to the dukedom of Courland, but having given occasion for discontent, the Courland nobles invoked the interference of Catharine. In 1795 he was obliged to cede his rights to the empress, after which he went to Prussia, where he acquired by purchase several ducal estates, among others that of Sagan. He died on one of his estates in 1800, leaving 4 daughters, one of whom is still known in the elegant aristocratic and political world where she first bore the name of the duchess of Dino, and afterward that of the duchess of Sagan.

**BIRR**, or **PARSONSTOWN**, a town in King's co., Ireland, 6½ miles from Dublin; pop. 6,886. It has had its full share of historical and military recollections and disasters, from the 9th century to the battle of the Boyne. Near it is Birr castle, the residence of the earl of Rosse, where is situated the celebrated observatory and telescope of that distinguished man of science.

**BIRSTALL**, a parish of Yorkshire, England, in the West Riding, 7 miles S. W. of Leeds; pop. 36,222. It contains 8 populous townships, and 41 woollen and worsted mills. There are also cotton and silk manufactories, and mines of coal and iron. The York and North Midland railway passes near the place.

**BIRTH**. The birth of a child is its deliverance from the womb of the mother, in which it had lived some 40 weeks already, without breathing; it is the commencement of a separate existence in the world, in which the infant lives and breathes as other beings of its race and species. The physical organism of man commences its existence in the womb, first as an embryo, which is gradually developed into a fetus; then as an immature corporeal frame; and finally as a mature child, sufficiently developed to be born into the world. At the end of the 39th or the beginning of the 40th week, the child has reached its perfect uterine development, and is prepared for birth into the external world; but various causes incidental to the mother, may precipitate the parturient efforts of the womb, and cause untimely birth; or retard the natural course of labor, and require artificial aid in parturition. There are several kinds of birth, therefore, such as premature, mature, and late; untimely, natural, and artificial; healthy, unhealthy, and irregular; normal, abnormal, and exceptional; and all these complications depend mainly on the health of the mother, although the health and physical conformation of the child may be advantageously or otherwise affected by the influence of the parent on its uterine existence. The period of gestation differs widely in animals of different species; but in each particular species it is fixed by nature with pre-

cision, so that all departures from the natural period of gestation in the human race or any other species of mammalia, are accidental or exceptional phenomena. The 40th week is the natural time of labor for a healthy woman. The child is then mature for birth. Contractions of the womb commence about that time, and give sensations of a somewhat violent nature, which are commonly called "labor pains." The preliminary pangs do not last long, and only give a feeling of unpleasant strain or pressure. The pregnant female seized with these slight pains, may be unable to move for a short space of time; but when the pain is gone, she may feel well again for several hours. These are called "false labor pains," and "premonitory symptoms." After some hours, true labor pains commence. They are more violent, last longer, and return sooner. They are caused by contractions of the womb, and involuntary efforts to expel the foetus. During the period of gestation, the womb grows larger with the growth of the embryo, and at the time of parturition has acquired considerable force and volume. The cervix uteri and the vagina, on the other hand, become relaxed and capable of much distention at that time. The child is enveloped in a double sac of membranes filled with an albuminous fluid, the head downward and the face in front; but, as the uterus contracts above, it forces downward the contents with a sort of spiral movement, causing the child to descend, head first, from the abdominal to the pelvic region, with the back of the head in lieu of the face finally turned in front. The fluid contained in the membranes enveloping the foetus is usually forced out first, with a portion of the sac, forming a sort of bladder, commonly called the "bag of waters," which gradually distends the parts, before the child is born. By repeated contractions of the womb, the bag of waters soon bursts, discharging the contents, diminishing the volume, and allowing the head of the child to occupy the lower space. The bones of the cranium are imperfectly united at this period, and easily yield in various directions, to suit the form of the external parts, as the head descends into the pelvic cavity, and passes through the os tincæ and the opening of the vulva. When the head has passed, the body follows easily and rapidly. Such is the process of a natural birth; and in a healthy state, all parturition would be natural and easy, unattended with much pain, beyond the passing pangs of a few violent spasmodic efforts in the womb, contracting to expel the foetus. There are, however, some exceptions to this natural process, mostly in feeble and unhealthy women. An easy birth occurs in due season, and without much straining effort. A difficult birth proceeds naturally, but with some delay and painful efforts. Instead of terminating in an hour or two, it may be prolonged over 8 or 10 or 20 hours, or more; sometimes even lasting several days, though rarely more than one.

Protracted labors are not always very painful; they are necessary to prepare the parts, in women who are not very young when they give birth to a first child. An artificial birth is accomplished by the aid of instruments or by the hands of the practitioner. Sometimes it is comparatively easy, and without much pain. It is, in fact, mostly intended to facilitate a difficult natural birth. A premature birth is one which occurs some weeks before the natural period; mostly at the end of the 7th month, in lieu of the 9th. Though 40 weeks is the full period of uterine maturity, the human fetus is completely formed at the end of the 5th month; and there are instances on record of 5-months children living. The birth is called "untimely" when it occurs before the end of the 7th month, and such children can rarely be kept alive. A premature birth, even at the end of 7 months, is very different from a natural birth at the full period. The child does not cry like a full-grown infant, but utters a faint sound, sleeps constantly, and must be warmly wrapped in flannel day and night, or its hands and feet might be immediately chilled, and injured for the rest of life. According as the child, thus prematurely born, is more or less mature in uterine development, the skin is red over the whole body, or sometimes blue, and covered with a fine, long, downy hair, particularly on the sides of the face and on the back. The fontanel is large; the bones of the skull are easily moved; the face is wrinkled and looks old; the eyes are often closed; the finger and toe nails are tender, soft, and very short. The body is very small, weighing but 5 or 6 pounds at most, in lieu of 8 or 10, or more. It is sometimes said, however, that a 7-months child is more easily kept alive than one which is born during the 8th month; but this is not well ascertained. "Late birth" is said to occur after the usual term of 40 weeks, which some believe is possible, while others doubt. There are many causes of deception and mistake in ordinary reckonings of time with pregnant women, who are seldom absolutely sure of the exact commencement of their pregnancy. Sometimes they know exactly, and oftener not. The question is of some interest in medical jurisprudence, where a child born more than 40 weeks after the absence or the death of the reputed father, is to be considered as legitimate or otherwise. Some believe that nature never exceeds 40 weeks' gestation in the human species; while others are inclined to think that she is susceptible of various exceptions to the general law, both with regard to premature parturition and protracted periods of gestation. Abortions and miscarriages are not uncommon. They occur from the beginning of pregnancy up to the 5th month, or later; but mostly during the 8d month. Violent emotions, and shocks of body or of mind, causing sudden revulsions of the nervous system, are the common causes of miscarriage and abortion. Weakly and excitable constitutions

are most liable to these revulsions, which detach the embryo or the partially formed fetus from the womb, before the time appointed by the laws of nature. Birth may occur, therefore, prematurely, maturely, or later than the usual period. The child may be naturally healthy or unhealthy in the womb; or, if healthy in the womb, it may be injured at the birth by malformation in the mother, or mismanagement in the delivery. Birth may be untimely, or natural, or artificial, where instruments or artificial aid are used in parturition. It may be normal, or abnormal, where the fetus is well formed in the womb, or undeveloped in its due proportions; and where two or more are born as twins, the case is more or less exceptional; the birth of each one may be difficult, or not, as their positions or presentations are unfavorable or otherwise. Natural birth at the full time is very simple, and fortunately the most common. Difficult parturition requires careful management by an accomplished midwife; and as every variety of accident and difficulty has been well observed and studied, there is little apprehension of unpleasant complication where good advice is sought in time.

BISAYA, a word signifying to tattoo; the name given to the people of that portion of the Philippine archipelago, comprising Samar, Panay, Leyte, Negros, Zebu, Masbate, Bohol, Sibuyan, Ticao, Guimaras, Panamao, and numerous smaller islands. The Bisayans comprise about  $\frac{1}{4}$ th of the population of the Philippine islands. The Bisayan language, of which there are 10 or 12 dialects, differing very much in the form of words, is regarded by Spanish and English writers as an original tongue, having no essential affinity with the Malay, or other language of the Indian islands; however, a consultation of the copious dictionary of Father Juan de Noceda, published at Manila in 1841, which contains 2 dialects of the island of Panay, the Hiligueina and Haraya, may lead others, as it has the writer of this article, to arrive at a different conclusion. It has been remarked that the Bisayan language is singularly wordy rather than copious. One illustration of this verbosity in the Bisayan language, is given by Mr. Crawford, the historian of the Indian archipelago, to show the absence of any essential Malay element in the language. To eat is expressed by 40 different terms; to eat generally, *kawn*, which certainly is not far removed from *makan* in Malay; *makumaku*, to eat a little (the Malays often repeat an adjective to express a diminutive, as *kachil-kachil*, very little); *dumun*, to eat greedily, to gorge; and *diyam* or *dium* is Malay for silent; *samung*, to eat by morsels, and *sambung*, is to piece in Malay; *kilau*, to eat raw meat, and *kulih* is skin in Malay; *pahit*, to eat pork; and *fahi*, and *vavi*, are Archipelagian names for pig, derived from the Malay, *babi*; and thus throughout the Bisayan language, there can be traced an essential relationship to the language of the great navigators of the Indian and Pacific oceans.

**BISCAY**, one of the Basque provinces of Spain, bounded N. by the bay of Biscay, S. by Alava, E. by Guipuzcoa, W. by Santander; area, 1,064 sq. miles; pop. 150,000, including some 5,500 nobles. The surface is irregular; the climate healthy; the soil, though not naturally very fertile, is by cultivation made productive. Fruit, Indian corn, and vegetables are grown abundantly, and of the finest quality. The country is principally divided into small farms, in the hands of the owners, who are frequently the descendants of ancient families. The houses are mostly of stone, and many of the old chateaux and towers have been converted into farm-houses. The iron of Biscay is of the first excellence. It is said that the great mine of Somorostro produces about 40,000 tons annually, though this seems an excessive estimate. The chief occupation of the Biscayans, beside agriculture, is fishery and the coasting trade. The local government is now under the general charge of the captain general of San Sebastian.

**BISCAY, BAY** or, an extensive bay of the Atlantic, the opening of which extends from cape Ortegal to Ushant. It is about 400 miles wide and 200 miles in length, being nearly semicircular. It is exceedingly stormy and tempestuous; the whole force of the westerly winds is felt, while the recoil of the waves from the coast causes a very heavy sea. A current sweeps round the inside of the bay, known as Rennell's current, which runs sometimes 26 miles per day. The Spanish coast washed by the waters of the bay is bold and rocky. The barren cliffs and frowning precipices of Cape Finisterre are particularly gloomy and grand. There are various small safe harbors on this coast. The French coast is low and sandy as far as the Loire, north of which it is of moderate height. The principal French harbors of the bay of Biscay are Bayonne, Bordeaux, La Rochelle, Nantes, Vannes, and L'Orient. The rivers of the north of Spain, which from the contiguity of the mountain chain to the coast are not of size or importance, find their outlet in the bay of Biscay, which receives from France the Loire, the Garonne, and some smaller streams.

**BISCAY, New**, in Mexico. See **DURANGO**.

**BISCEGLIA**, a strongly fortified seaport town of Naples, Terra di Bari, 21 miles W. N. W. of Bari. It is the seat of a bishop, and has a cathedral, 2 monasteries, a hospital, and an ecclesiastical college. The harbor only admits small vessels. Pop. 15,000.

**BISCHOFF, GEORG FRIEDRICH**, the originator of the German musical societies and Sängerbünde, born at Ellrich in the Hartz, Aug. 21, 1780, died Sept. 17, 1841. In 1808 he was employed by the French government at Erfurt, and appeared with his societies before Napoleon and the other monarchs.

**BISCHOFF, THEODOR LUDWIG WILHELM**, a German physiologist, born Oct. 28, 1807, at Hanover, was professor at Hackelburg in 1836, and

in 1843 became professor of the school of anatomy and surgery at Gressen, where he founded a museum of anatomy and physiology. He has written several treatises on entomology.

**BISCHOFF VON ALTENSTEIN, GNATZ RUDOLF**, a German physician, born Aug. 15, 1782, at Kremsnaunster, in Austria, died July 15, 1850. He was professor at Prague and Vienna, and published a work on typhus and nervous fevers in 1815, and also books on chronic diseases, the natural history of man, pulmonary diseases, and poisons. He had a high reputation in all Germany, both as a practitioner and as a medical writer.

**BISCHOFSWERDA**, a city of Saxony, capital of a jurisdiction of the same name, on the river Wesenitz, having 3,250 inhabitants, chiefly employed in the manufacture of cloths and the preparation of granite building stones. On a neighboring summit is the castle of St. John, which was finished in 1856. Bischofswerda was raised to a city by Benno, bishop of Meissen, in 1076. It has suffered several conflagrations, one of which was by the Hussites in 1429, and another in an engagement between the French and Russians in 1813, but Napoleon gave 100,000 francs as an indemnity. It is the birthplace of the theologian Bahrdt.

**BISCHOFSWERDER, JOHANN RUDOLF VON**, a Prussian statesman, born in Saxony about 1738, died near Berlin in 1803. Under Frederic William II. he had an almost supreme power in the government. As plenipotentiary of Prussia he was at the Congress of Szistowe, and brought together the king and the emperor Leopold at Pilnitz. In 1782, being made a general, he accompanied the king in a campaign, and was subsequently ambassador in Paris till 1794. When Frederic William died in 1797, he received a pension, and was forbidden again to present himself at court.

**BISCHOP, NICOLAS**, in Latin *Episcopus*, a Swiss printer, born at Weissenburg, near the end of the 15th century. He was learned in the Greek and Latin languages, and having married the daughter and associated himself in business with the son of the famous Jean Froben, undertook to publish at Basel a collection of the Greek fathers, and began the series with the works of St. Basil, in 1529.

**BISCHWILLER**, a town in France, situated on the Moder, 14 miles N. of Strasburg, pop. in 1856, 7,676. It was formerly fortified, but was dismantled by the imperialists in 1706. Near Bischwiller is situated the rich iron mine of Mittelhardt. Its manufactures consist of woolen and linen stuffs, oil, soap, and earthenware.

**BISCUIT**, in pottery, the name given to porcelain ware which has been twice baked, but has not received the finishing process of glazing. Many beautiful ornamental articles, as vases, medallions, statuettes, and other imitations of sculpture, are made of this material, and for durability and cleanliness they are to be preferred to the same articles in marble or alabaster. They often possess the translucency of

the finest Parian marble. The most famous manufactories of ornaments in porcelain biscuit are those of Sèvres in France. The work has also been carried to a high state of perfection in England, principally by the ingenuity and industry of Josiah Wedgwood, whose name is still attached to the peculiar varieties of the ware which he introduced. Several kinds of biscuit are produced by his processes, as the porcelain-biscuit, which possesses such hardness, that it is used for mortars for domestic and chemical purposes; the white porcelain-biscuit, also of extreme hardness, and employed for many useful and ornamental articles; the bamboo, or biscuit of the yellow color of canes, and the jasper, a white biscuit of great beauty and delicacy, suitable for cameos and other similar objects.

BISHAREEN, BISHAREE, or BIDJA, the collective name of a number of tribes who inhabit the desert between the valley of the Nile and the Red sea, and skirting the districts of Nubia and Abyssinia. They are nomadic in their mode of life, but not of Arabian descent. Camels, sheep, goats, horses, and asses, are their only wealth. In winter they pasture their flocks on the mountains near the Red sea, where the rain produces herbage in the gulleys of the winter streams, but in summer they are obliged to descend to the Nile. For this privilege of getting grass they pay tribute to the Ababdes. They live entirely upon milk and flesh, which they eat raw. A few of them sometimes visit Derr or Asswan, with senna, sheep, and ostrich feathers. In exchange they take shirts and dhurra, the grains of which they swallow uncooked. They resemble the Ababdes in appearance. Their complexion is dark brown; the dress of both sexes consists only of a sort of shirt. They live in tents covered with the leaves of the doum palm. The Bishareen are constantly armed with the primitive bow and arrow. Their youths make plundering excursions, mounted upon camels of a superior breed. They stand in dread of the Ababdes, who often surprise their mountain encampments. They are hostile toward strangers, and have left unfavorable impressions upon travelers. They are Mohammedans, but do not observe the rites prescribed by the Koran. Very few of them understand Arabic; those who live on the Abyssinian frontier understand the Abyssinian, to which their own language is closely allied. Burckhardt's "Travels in Nubia," is the chief authority concerning them.

BISHARIBA, a people of Nubia, in Africa, more than 200,000 in number, who lead a nomadic life in a desert tract, which they call Edbai, between lat. 23° and 15° N. They are of a dark brown, almost black color, with decided negro features, but of a mild, humane, intelligent, and almost European character. They abide principally around the mountain Elba. The Amarar, to the south of this mountain, is the most powerful of the tribes into which the people is divided. The language of the Bisha-

riba, called the Begania, is spoken from the Red sea to the Nile, and from the southern boundary of Egypt to Suakim, and is wholly different from the neighboring languages. A dialect of it is spoken by the Ababdes, an almost independent nomadic people dwelling further north.

BISHOP (Sax. *biacop*, from Gr. *ἐπισκοπος*, a superintendent), in the Greek, Latin, and Anglican churches, the title given to those who are of the highest order of the priesthood, to the successors of the 12 apostles, in distinction from the priests who are the successors of the 72 disciples; in the Methodist Episcopal and Moravian churches, and in the Protestant churches of Sweden, Norway, and Denmark, it is the title given to the highest officers in the ministry, who are not, however, regarded as a distinct order; in Germany the office is hardly more than titular, and is conferred upon princes as well as ecclesiastics. The name was borrowed by the first Christians from the languages of Greece and Rome, in which it designated a civil magistrate. Thus, Cicero was at one time *episcopus ora campania*. In the New Testament, the words bishop and presbyter, or priest, are sometimes interchanged, as in Acts xx. 17, 28, and St. John, in his last 2 epistles, adopts the title of priest. Yet, as maintained by Roman Catholic writers, it does not follow because the names priest and bishop were then applied indistinctly, that there existed no distinction between the episcopate and the priesthood. "There might have been confusion in the names," says St. Thomas, "but not in the character." Timothy and Titus exhibited the episcopal type during the life of St. Paul, who charged Titus, in consecrating him bishop of the isle of Crete, to ordain priests in every town, to have over them full jurisdiction, and to be the judge before whom complaints might be established by 2 or 3 witnesses. In the epistles of Ignatius, in the beginning of the 2d century, the episcopate is represented as the divinely appointed pillar which sustains the whole ecclesiastical structure. The bishops preside in the church as the representatives of God, and the priests hold the place of the apostolic senate. Tertullian directs the priests and deacons to do nothing without the consent of the bishop. Cyprian speaks of the bishop as the successor of the apostles, the vicar of Christ, the representative and individual organ of the church, in which he has supreme power, being responsible to God alone, and yet bound in important matters to receive the counsel of his presbyters. Bishops in the Catholic church are regarded as officers appointed by the Holy Spirit to govern the church of God. The authority which they exercise belongs to their character, and comes from God himself, while the jurisdiction of the priests emanates only from a bishop, and can be exercised only under his direction. Bishops are necessary not only to watch and preside over the church, but also to secure the continuity of the ministry, and to

transmit by ordination the mission which they have received from Jesus Christ. They are all equal in power, because they have all received the fulness of the priesthood, but there are degrees of jurisdiction and honor according to the importance of the sees which they occupy. The principal distinctions which have been introduced are the patriarchs, exarchs, and archbishops, and above all, the bishop of Rome, the pope, around whom all other bishops rally as rays to a common centre. At first, the bishops were elected by the clergy and people of the diocese, but on account of the tumults inseparable from popular assemblies, various councils, from that of Laodicea in the 4th century, to that of Lateran in 1215, restrained and suppressed the electoral rights of the laity. Charlemagne and other of the northern kings appointed, by their own authority, the bishops of their own kingdoms. The pope, unwilling that bishops should be dependent upon princes, brought it about that the canons in cathedral churches should have the election of their bishops, which elections were usually confirmed at Rome. At present the mode of electing bishops varies in different countries. They are elected in some countries by cathedral canons; in others, as in France and Bavaria, they are nominated by the crown or governments. In all cases the names designated are sent to Rome for confirmation, and the person chosen is appointed to his see by letters apostolic. According to the decrees of the council of Trent, the candidate for this order must be of legitimate birth, 30 years old, well reputed for learning and morality, usually a native of the country in which his bishopric lies, and acceptable to the political government thereof. Within 8 months from his confirmation he receives the rite of consecration, which is performed in the cathedral of the new bishop, according to the directions of the pontifical, by 3 bishops appointed for that purpose. The candidate takes the ancient oath of allegiance to the pope, the oath of civil allegiance, subscribes to the confession of faith, receives the insignia of his office, is anointed and solemnly enthroned, and concludes the ceremony with pronouncing the benediction. His insignia are a mitre, the symbol of power, a crosier, in allusion to his shepherd's duties, a finger-ring (*annulus pastoralis*), a sign of his marriage with the church, a cross on the breast, distinctive gloves and sandals, and an official robe. The functions of the bishop embrace all the rites and offices of the Christian religion. He administers 5 sacraments in common with priests, and 2 others, those of confirmation and ordination, are his peculiar prerogatives. He examines and approves or condemns the works published in his diocese concerning religion, and takes part in the general councils convoked by the pope for deciding questions of faith. The guardian of discipline, he makes statutes and ordinances which he judges necessary to the maintenance of it, dispenses with canons according to the canons themselves, judges the

offences of ecclesiastics, and has power of suspension, excommunication, and absolution. There are Catholic bishops who have no dioceses, and who perform duties within limits assigned by the holy see as vicars apostolic. They bear the title of bishops in *partibus infidelium*, because they are assigned to sees which are in the possessions of infidels, and are specially delegated to ecclesiastical duties elsewhere. These were originally bishops, who had been expelled by Mohammedan conquests from their dioceses in the East, and were afterward appointed by the pope as an expression of a perpetual hope and a protest with respect to those conquered sees.—The Protestant movement introduced new conceptions of the church, and changed the form of church government. In the different branches of Protestantism, there was substituted for bishops either the presbytery or ecclesiastical autonomy, or the office of bishop was retained with diminished powers. Only in England has episcopacy been defended by Protestants as a divine institution. Other Protestants affirm its post-apostolic, and therefore human origin. The functions of the Anglican bishop are confirmation, ordination of deacons and priests, consecration of other bishops, dedication or consecration of religious edifices and grounds, administration of the effects of deceased persons till some one has proved a right of executorship, adjudication in questions respecting matrimony and divorce, institution or collation to vacant churches in their diocese, superintendence of the conduct of the priests in the same, and power of suspension, deprivation, deposition, degradation, and excommunication. They are also the medium of communication between the king and people upon matters relating to religion. They are peers of the realm, members of the house of lords, and for the most part richly endowed. Recently, the revenue of the different sees has been reduced more nearly to an equality, and the income of the archbishop of Canterbury has been fixed at £15,000, that of the archbishop of York at £10,000, those of London, Durham, and Winchester at £8,000 each, and the others at from £5,500 to £4,500. The Anglican bishops are nominated by the crown, and then formally elected by the chapters. The ecclesiastical powers of bishops in the Protestant Episcopal church of America resemble those of the Anglican bishops, but they have no political functions. They are elected by the clerical and lay deputies of the vacant diocese assembled in convention, and before consecration are required to produce certificates before the house of bishops, and the house of clerical and lay deputies in general convention. The rights of this office are so restricted in Germany that even Roman Catholic rulers have sometimes been made bishops in the Lutheran church. In Prussia and Nassau this title is ordinarily given to the general superintendents of the Evangelical church. Attempts have been made without success to give this church an episcopal organi-

zation.—The bishops of the Greek church are appointed by the archbishops, and must be selected from the monks, and are therefore always unmarried. They have much less authority than the Roman Catholic bishops.—The bishopric is the district or diocese over which a bishop has spiritual jurisdiction. There are in England, exclusive of the archbishoprics, 26 bishoprics of the Anglican church, 12 in Ireland, and 82 colonial bishoprics. In the United States there are 86 bishoprics of the Protestant Episcopal church, and 37 of the Roman Catholic church. There are 5 bishops in the northern division of the Methodist Episcopal church, and 6 in the southern. Over the entire world there are 560 Roman Catholic bishoprics. See also ARCH-BISHOP.

**BISHOP, SIR HENRY ROWLEY**, an English musical composer, born in London in 1775, died April 30, 1855. In 1806 he composed the music of a ballet, entitled "Tamerlane and Bajazet," which was performed at the Italian opera house, and, in 1808, that of "Caractacus," a pantomime ballet, at Drury Lane. At this theatre, in the following year, was successfully produced his first opera, "The Circassian Bride," but on the following evening (Feb. 24, 1809) the theatre was burned to the ground, and with it the score of the opera; the duet, "I love thee," alone remaining to show the character of the music. Between that time and 1826, his dramatic engagements of all sorts were numerous, including (to use his own words) "operas, burlettas, melodramas, incidental music to Shakespeare's plays, patchings and adaptations of foreign operas, with glees, ballads, canzonets, and cantatas." During this time he was director of music at Covent Garden theatre, and among over fifty operas which he wrote, the most successful were "Guy Mannering," "The Maniac," "The Miller and his Men," "Maid Marion," "The Slave," "Clari," "The Englishman in India," &c. In 1826, while Weber's "Oberon" was creating considerable sensation at Covent Garden, Bishop's "Aladdin" was produced at Drury Lane, in rivalry. In this, however, having Germanized his style, instead of trusting to his own genius, he did not succeed, and he determined to abandon dramatic composition. He adapted Mozart's "Barber of Seville," "Marriage of Figaro," and some other operas, to the English stage. He was director of the concerts of ancient music for several years, also one of the first directors of the philharmonic concerts, and composed some sacred pieces which were performed at different musical festivals. He succeeded Sir John Stevenson as arranger of the music of Moore's "Irish Melodies." In 1842 he was knighted by Queen Victoria. He had, in 1841, been elected professor of music in the university of Edinburgh, but as residence during a greater part of the year was indispensable, and he did not like to leave London, he resigned the appointment in 1843, about which time he received the degree of doctor of music from Oxford, and, on the death of Dr. Crotch, in 1848,

was elected to the chair of music in that university, which appointment he held until his death. Some time before that took place, his embarrassments were so hopeless and pressing, that a subscription was set on foot among his friends and admirers to relieve them, and sufficient was raised to rid him of his debts. From the same charitable source funds were provided to support and educate his children. Latterly, Sir Henry Bishop's almost exclusive source of income was derived from the "Illustrated London News," for which he arranged a large number of old English airs, to which Dr. Charles Mackay wrote the words. Though Bishop's operas have ceased to be performed, many of the finest songs, duets, and concerted pieces which they contained, are separately known and valued, having been transferred to the concert-room and the chamber. His style was essentially English, devoid of affectation, free, flowing, and harmonious.—Sir Henry Bishop was twice married: first, early in life, to Miss Lyon, a vocalist, by whom he left 8 children; secondly, in 1831, to Miss Anna Riviere, a singer of Bath, many years his junior. Both marriages were unfortunate. The latter, well known as Madame Anna Bishop, left her husband and 8 children in 1840, and made professional tours in the United States, and in Australia, with Signor Bochsa, an accomplished musician, but a man of doubtful character, until his death in 1856. This circumstance cast a cloud over the closing years of Sir Henry Bishop's life.

**BISHOP'S CASTLE**, a borough, parish, and market-town in the county of Salop, England, 159 miles from London and 20 miles from Shrewsbury; pop. of the parish in 1851, 1,961. It receives its name from an old castle belonging to the bishops of Hereford, which once stood here, but has been long since demolished. The town is an old corporation, and has had 3 charters, one from Queen Elizabeth, the second from James I., and the last from James II. It received from Queen Elizabeth the privilege of sending 2 members to the house of commons, but was disfranchised by the reform bill. It has a church which suffered in the civil wars, several dissenting chapels, an endowed free school, a weekly market, and 6 annual fairs.

**BISIGNANO** (anc. *Besidlo*), a small town, pop. 3,600, in the province of Calabria Citra, in the kingdom of Naples, about 18 miles north of Cosenza. Bisignano gives the title of prince to the Sanseverinos, and is a bishop's see.

**BISLEY**, a market-town and parish in the county of Gloucester, England, 96 miles W. of London; pop. in 1851, 4,801. It is intersected by the Gloucester and Bristol railway and the Stroudwater canal. It has a church, an endowed free school, and woollen manufactures.

**BISMARCK, FRIEDRICH WILHELM**, count von, a German general, born at Windheim, in Westphalia, July 28, 1788. In 1798 he entered the army of Hanover as an ensign, and in 1804 was attached to the Hanoverian legion in the English army. The result of a duel forcing him to

leave the English service, he entered that of the king of Wurtemberg, in 1807, and was soon after appointed captain of cavalry. During the campaign in Russia, he served under the command of Ney, and distinguished himself at the Beresina. He was made a prisoner at Leipsic, but returned to Wurtemberg in 1813. In 1815 he received the title of count; in 1819 he was appointed brigadier-general. In 1828 Count Bismark introduced his system of cavalry tactics into the Danish army, and was soon after appointed commander-in-chief of the cavalry of Wurtemberg. He has published several military treatises, and also a work upon Russia, which he visited in 1829.

**BISMUTH**, a brittle metal of lamellar texture, a reddish or yellowish white color, and so fusible that it will melt in the flame of a lamp, at a temperature of 476° F. Its specific gravity is 9.73 to 9.82, and its hardness only from 2 to 2.5. It is volatile at high temperatures, and may with difficulty be distilled in close vessels. When melted and left to cool slowly, it crystallizes in cubical forms. Beautiful groups of these may be obtained by first pouring the purified metal into a heated mould, and, letting it cool for some time slowly and quietly, until a solid crust is formed on the surface; then breaking 2 or more holes in this, and pouring out the liquid metal: the cavity left will be found, when cool, lined with the crystals. Bismuth is very easily oxidized, and soon loses its metallic lustre when exposed to the air. The air let in through the broken crust of the melted metal causes a thin, beautifully iridescent pellicle of oxide to be instantly formed over the surface of the crystals. The metal is generally contaminated with sulphur and arsenic, which add to its brittleness. Perfectly pure bismuth is somewhat malleable, particularly when heated. The arsenic is separated by re-melting with 1 part of nitre to 10 of the metal, after the sulphur has been removed by pouring off the liquid metal from the portion which commences to solidify—this containing all the sulphur. Notwithstanding the great affinity of bismuth for oxygen, it is found native, especially in the mines of the Saxon Erzgebirge, at Schneeberg, and in Bohemia, Sweden, and Transylvania. It is also obtained from the sulphuret, found associated with sulphurets of other metals, particularly of cobalt, arsenic, silver, gold, copper, lead, nickel, and tellurium. The treatment of the ore containing the native metal is very simple. Pieces are introduced into the upper end of wrought-iron pipes, which are laid in an inclined position over a fire, and as the metal melts, it eliquates or runs out of the lower end into clay pots, which are set over hot coals to receive it. From these it is poured into ingot-moulds. When other ores of value, as of cobalt, are present, these are obtained freed from the bismuth in the residue left in the tubes, and the extraction of the bismuth is only of secondary importance.—The alloys of bismuth are interesting for their great fusibility,

That called the fusible alloy of Newton has been already noticed under the article **ALLOY**. One composed of 5 parts of bismuth, 8 of lead, and 2 of tin, is still more fusible, melting at 197° F. Safety plugs have been contrived for steam boilers of some of these alloys, which were expected to melt away and let off steam when the temperature became too high for safety; but it appears that after being long exposed to an elevated temperature, they undergo a sort of eliquation, the more fusible alloy melting out, and leaving the remainder much less fusible than it was originally. Even if they remained permanent, it is probable the steam acts too instantaneously in exploding for the plugs to serve any purpose. Though abandoned for this purpose, fusible alloys are useful for making casts for anatomical preparations and other purposes. The alloys may even be poured upon wood or embossed paper, and receive a perfect fac-simile of their form. The manufacturers of fancy soap use it for the moulds of the cakes of soap. It is also an ingredient in type-metal, increasing the fusibility, and causing the alloy to expand and fill the mould perfectly as it cools.—The teroxide of bismuth is the product of the combustion of the metal in the open air. It burns with a faint blue flame, and forms an oxide of a yellow color, which consists of 1 equivalent of bismuth=213, and 8 of oxygen=24. It is also obtained by dissolving the metal in nitric acid, and precipitating by caustic potassa.—The only medicinal preparation of bismuth is that of the subnitrate. This is produced by adding water to the nitric acid solution, and allowing it to stand, that the subsalt may subside. It is a tasteless, heavy powder, of pure white color, and frequently contains arsenic. This, however, does not prevent its being used under the name of pearl-white as a cosmetic for the complexion. In medicine it acts as a tonic and anti-spasmodic, and is used in cases of epilepsy, palpitation of the heart, obstinate diarrhoea, &c. In large doses it acts as a poison, for which the remedies are mucilaginous drinks and bleeding.—Bismuth was not known to the ancients. It was formerly confounded with lead. The first notice of it as a metal was by Agricola, in the year 1529. All the metal now procured for commerce comes from the mines of Schneeberg and Johann-Georgenstadt, and the cobalt works of Saxony. The whole product for the year 1830 was only about 10,000 lbs. Its wholesale price in Europe is from 80 to 40 cents per lb.; imported into England, it is worth \$70 per cwt. Native bismuth is found in Monroe, Conn., also at a mine in South Carolina, and in California.

**BISON**, a peculiar species of the ox family, of which there are but 3 known varieties. First, the European or Eur-Asiatic species, *Bos urus*, known as the *bonassus*, which is supposed to be the ancient *urus* or *aurochs*, which, in the times of the Romans, abounded in the woody wildernesses of Germany, northern Gaul, and what is now Belgium, Holland, and Zealand. It was known

in those regions so lately as the latter part of the middle ages. It is now nearly extinct, and is found only in the forests of Lithuania. Its distinguishing characteristics are an arched forehead, wider than it is long, short horns attached below the occipital ridge, unusual length of legs, an additional pair of ribs, and the thick woolly hair which covers the head, neck, and shoulders of the male, forming a shaggy beard under the chin. The European bison is an animal of vast power, and is singularly fierce and indomitable.—The second species is the Indian bison (*B. gaurus*). This animal is but partially known and imperfectly described. It has the general characteristics of the bison, the short horns, huge head, unshapely forehead, and the vast masses of shaggy wool covering those parts. It frequents the Ghauts, and the wildest forest ranges of the Himalayas.—The third, and best known variety, is the bison, commonly and erroneously called buffalo, of North America (*B. Americanus*). The peculiar distinction of the American bison is its singular hump over the fore-shoulders; this hump is of an oblong form, diminishing in height as it recedes, so as to give considerable obliquity to the line of the back. The eye is black and brilliant; the horns are black, and very thick near the head, whence they curve upward and outward, tapering rapidly toward the point. The outline of the face is convexly curved, and the upper lip, on each side, being papillous within, dilates and extends downward, giving a very oblique appearance to the lateral gap of the mouth, in this particular resembling the ancient architectural bas-reliefs representing the heads of oxen. The physiognomy of the bison is menacing and ferocious; and no one can see this animal, for the first time, in his native wilds, without feeling inclined immediately to attend to his personal safety. This ferocious appearance is, however, a mere delusion and an outward show, since, of all his species, the bison is the most pacific and inoffensive. Even in his breeding season, when the common domestic bull is not seldom dangerous, when the stag and elk will attack promiscuously whatever comes in their way, and when most animals of any spirit incline to pugnacity, the bison will not attack mankind. The summer coat of the bison differs from his winter dress, rather in difference of length than in other particulars. In summer, from the shoulders backward, the hinder parts of the animal are all covered with a very short fine hair, that is as smooth to the touch as velvet. The tail is short, and tufted at the end, and its utility as a fly-brush is very limited. The color of the hair is uniformly dun, but the long hair on the anterior parts of the body is, to a certain extent, tinged with yellowish or rust color. The shaggy masses of hair, which cover the head, shoulders, and neck of the male, with his great beard, are of a darker shade of the same hue. The sexual season of the bison commences in July, toward the latter end of

the month, and lasts till the beginning of September; after which time the cows leave the company of the bulls and range in different herds. They calve in April, and the calves never leave the mother until they are a year old, while they often follow her until they are 8 years old. From July to the end of December the cows are very fat, and in prime condition; the bulls are always poor, and their flesh is lean and hard; during the breeding season it is rank and positively disagreeable. At this time of the year, the roaring of the bulls on the prairies is like hoarse thunder, and they fight furious battles among themselves. When migrating, they travel in vast solid columns of thousands and tens of thousands, which it is almost impossible to turn or arrest in their progress, since the rearward masses, pressing madly forward, drive the leaders on, whether they will or no; of which habit the Indians take advantage, by driving them in vast numbers over precipices, as a wholesale way of hunting them. The flesh of the bison, the cow especially, is like very coarse-grained beef, but is juicy, tender, and sapid, in the highest degree. The favorite portion is the hump, which, when cooked in the Indian fashion, by sewing it up in the hide, singed and denuded of hair, and baking it in an earthen oven, wherein a fire has been previously kindled, and over which a second fire is kept burning during the process, is considered the most exquisite of dainties; the tongue and the marrow-bones are also greatly prized; and it is too often the case that the American hunter of the prairie, in the very wantonness of epicturism, kills fat cows by the score and hundred, and, only taking the tongues, leaves the carcasses to rot on the plains, or, at the best, to feed the vulture and the wolf. This habit of indiscriminate destruction is rapidly depopulating the continent, its woods, its wastes, and its waters, of the choicest of its natural denizens. Numerous tribes of Indians are almost entirely dependent on the bison for their food, their clothing, their dwellings, and even their fuel; for the dressed hides with the hair on form their robes—denuded of it, the covers of their tents; and their dried ordure—known on the prairies as *bois de vache*—on the vast treeless plains of the West, furnishes the sole material for their fires. The dressed hides are a considerable article of commerce, and for these, as well as for the other causes, or want of causes, described above, the slaughter of these animals is so prodigious, that vast as are their multitudes, they decrease so rapidly that but few years can elapse ere they will be extinct. Their original range appears to have been the whole of the North American continent, west of Lake Champlain and the Hudson river, with the exception of some intervals on the Atlantic sea-board, and south of the Ottawa and Columbia rivers, northward of which its place is supplied by the musk-ox, as is that of the elk and moose by the reindeer. For many years they have ceased to exist to

the eastward of the Mississippi, and every year drives them further and further toward the setting sun, which seems to be emblematic of their future, as of that of the red Indian, the noblest savage man the world has ever produced, who, *pari passu* with the wild herds which were the main support of his people, is travelling the road to total extinction.

BISSAGOS, a group of islands, situated near the mouth of the Rio Grande, in western Africa, between lat. 10° 2' and 11° 55' N., and long. 15° and 17° W. Only 16 of them are of any considerable magnitude. They are inhabited by a fierce and warlike race. Millet, rice, and fruits are raised in great abundance, and the islands produce a singular breed of cattle, with a hump on the back.

BISSÃO, one of the Bissagos islands, situated opposite the delta of the Jéba river, and containing a Portuguese settlement. It is the centre of the Portuguese slave-trade, but has also considerable trade in hides, rice, and wax, and imports English manufactures to the value of \$100,000 annually. Pop. 8,000. Lat. of fort, 11° 51' N., long. 15° 37' W.

BISSAT, or BISSART, PATRICK, poet and philosopher, born in Scotland in 1500, died at Bologna in 1568, was descended from the earls of Fife. He received his education at St. Andrew's, and after spending some time in the university of Paris, removed to Bologna, where he became professor of canon law.

BISSELL, WILLIAM H., governor of Illinois, born near Cooperstown, N. Y., April 25, 1811. His father, a pioneer settler from Connecticut, gave to his son such an education as his limited means afforded. Going to the common school in winter and teaching a similar school in summer formed the employment of young Bissell till his 17th year, when he commenced the study of medicine and graduated at the Jefferson medical college in Philadelphia, in the spring of 1835. He practised medicine 2 years at Painted Post, N. Y., whence in 1837 he removed to Illinois. Here, in Monroe county, he pursued the practice of his profession with success for several years. He was elected to the state legislature in 1840, and there earned distinction as a forcible and ready debater. Finding his health unable to bear the exposure of a physician's life in southern Illinois, he determined to adopt the profession of the law, and after the necessary studies removed to Belleville, in the county of St. Clair, and there practised law with distinguished success till, in 1846, he was elected colonel of the second Illinois regiment of volunteers for the Mexican war. At this time he held the office of state's attorney for the second judicial district, to which he had been elected by the legislature in the winter of 1844-45. In the execution of this office, in a district which included 9 counties, his powers as an advocate and a lawyer found ample opportunity. In the campaign which included the battle of Buena Vista, however, he became known to the country at large. On his return

home in 1849, he was elected, without a competitor, as representative in congress from the 8th district of Illinois. His first term was signalized by a speech in which he vindicated the merits of his own regiment at the battle of Buena Vista, a subject which was drawn into the debate by an attack made by a Virginia member upon the north and northern troops. He subsequently resisted the repeal of the Missouri compromise, though he had previously acted with the democratic party. He declined a third election to congress in 1854 on account of infirm health. In 1856 the republican party of Illinois, by a unanimous vote in convention, selected him as their candidate for governor, and he was elected by a large majority over 2 competitors, although Mr. Buchanan carried the state against Fremont, the presidential candidate of Bissell's party.

BISSET, JAMES, an artist and writer, born at Perth, Scotland, in 1762, and died at Leamington, Aug. 17, 1832. Previous to his removal to Leamington, he kept in Birmingham a shop for curiosities. He had a wonderful facility for rhyme, and his guide-books and patriotic songs are printed pell-mell mingled with "comic strictures on the fine arts," all of which are written half in rhyme. In 1814 he was appointed modeller to the king. His curiosity shop is said to have contained a unique collection of old furniture, arms, savage weapons, with a strange assortment of old engravings in copper and steel.

BISSET, ROBERT, an English writer, born in 1759, died in 1805, a graduate of the university of Oxford. He was a voluminous writer, and is known in the United States and in England as the continuator of the histories of Hume and Smollet, which he brought down to the end of the reign of George III. His book is accurate, but has little style or eloquence. He was a violent tory, and published in 1786 an essay on democracy and a life of Edmund Burke. He also published a romance called "Douglas," in 4 volumes 12mo. We are also indebted to him for an edition of the "Spectator," with lives of the various contributors and valuable notes. He had a brother who served in the British navy during the wars with the French republic.

BISSEXTILE YEAR, the ancient name of leap year, so called from the 6th day before the calends of March being repeated or taken twice. See CALENDAR.

BISSOLEE, or BISULI, a town of the Punjab, situated 95 miles N. E. of Lahore, on the Ravee. It contains a large palace, resembling an old feudal castle, and a large bazaar.

BISTINEAU, a lake in north-western Louisiana, dividing Bossier and Bienville parishes, about 80 miles in length from N. to S., and 2 in breadth. It receives the Dauchite river from the north, and communicates with Red river by an outlet at its southern extremity. It is navigated by steamboats.

BISTOURY, a surgical instrument for making incisions. According to Huet, the name of this

instrument is derived from that of a town in Italy, Pistoia, or Pistori, formerly renowned for the manufacture of surgical instruments, and more especially the bistoury. It is either straight or curved in form, the blade fixed in the handle or turning like that of a lancet, and varies from the size of a small penknife to that of a large pocket knife, according to the use for which it is intended. It is mainly used to make incisions through the skin, or through membranous tissues.

BISTRE, a reddish brown water-color, generally obtained from the soot that collects in chimney-flues. This is pulverized and washed to remove the saline ingredients. The finest sediment is then dissolved in vinegar, to which gum-water is afterward added. It was formerly much used for making painters' crayons, and also for a paint in water-color designs. Sepia, however, is now preferred to it, as it has a more agreeable color and is more easily employed. In aquatint engravings it is sometimes used upon the plates, the effect being to give the engravings the appearance of original designs.

BISTRITZ, or BISTRITZ, the name of several rivers and places in Transylvania, Hungary, Bohemia, Moravia, Moldavia, and Illyria, of which the 2 most important are: I. A free royal town, pop. 7,000, on a river and in the circle of the same name in Transylvania (the latter called also Beztercze Bideke), called by the Saxon settlers Nösen, or Nösenstadt. It has 8 gates of entrance, 2 suburbs chiefly tenanted by Wallachs, a Protestant church and gymnasium, a Roman Catholic church, gymnasium, and 2 monasteries of Minorite friars and Piarists respectively, and 2 hospitals. Wine, potashes, and cattle-selling are the chief sources of wealth. Near it are the remains of a castle once the residence of the Hunyads. II. A market-town in Moravia, at the foot of the Hostein; pop. 2,900. It has mines of gold and other metals.

BITOHE, a town and fortress of the French department of Moselle; pop. in 1856, 8,297. The fort is on an isolated rock, defending the defiles of the Vosges, with casemates hewn from the rock, and bomb-proof, is well supplied with water, and defended by 90 cannons. The town has manufactures of paper and porcelain.

BITHYNIA, an ancient country of Asia Minor, which was bounded on the north by the Euxine, on the south by Phrygia and Galatia, on the east by Paphlagonia, and on the west by the Propontis and Mysia. That part of Bithynia which adjoined the Propontis and Euxine was often called Bebrycia in the earlier ages, from the Bebrycæ, its aboriginal inhabitants. Homer never styles the people of this country Bithynians, but always Mysians or Phrygians; and Strabo asserts that the Mysians formerly occupied the most fertile portions of it; the Bebrycæ may in fact have been a Mysian tribe. We know not precisely at what period the Bithyni seized on that delightful region to

which they afterward communicated their name, but we can have no doubt as to their original seat. On this point ancient authors are unanimous. Herodotus expressly affirms that the Bithyni came from the banks of the Strymon in Thrace, having been expelled thence by a more powerful horde; and Thucydides and Xenophon corroborate this statement by frequently calling their descendants Bithynian Thracians. The inland inhabitants are sometimes called Bithyni, and those of the coast Thyni. This, however, is a distinction of no importance, for both were still mere branches of one common race. The Bithynians maintained their independence till they were subdued by Croesus, king of Lydia. On the overthrow of the Lydian monarchy they passed under the yoke of the Persians, and their country became a part of the satrapy of Phrygia. In later times, however, it was itself constituted into a satrapy, which the Greek historians and geographers generally style the satrapy of Bithynia, but sometimes that of the Hellespont or Dascylium. After the defeat of the Persians on the Granicus, Bithynia fell under the sway of the Macedonians, who did not, however, long remain masters of it. For during the anarchy which followed the death of Alexander the Great, Botirus, a Thracian chief, crossed the Bosphorus with a strong body of his countrymen, vanquished Calantus, the Macedonian governor, and took possession of Bithynia for himself and his posterity. Nicomedes, the 4th in descent from Botirus, was the first of this dynasty who assumed the title of king, and raised Bithynia to the dignity of a kingdom. This potentate changed the name of Astacus, a Greek city which his ancestor had seized on and made the capital of his principality, to Nicomedia. Here he fixed the seat of his government, and here the Bithynian monarchs continued to reside during the existence of their little state. The kingdom of Bithynia endured for over 2 centuries. Its last king was Nicomedes III., who, having no children, bequeathed his dominions, when dying, to the Romans, 75 B. C. The Romans annexed Bithynia first to the province of Asia, and then to that of Pontus. In the reign of Augustus, however, it was separated from the latter, and, together with the western part of Paphlagonia, was constituted a proconsular province. This arrangement was set aside by Theodosius, who divided the province into 2, giving to the further one the name of Honoricis, and restricting to the nearer one that of Bithynia. Whether they were ever again reunited we are not informed. The inland districts of Bithynia were mountainous and woody, but the country near the coast consisted for the most part of fertile plains, which were studded with villages, and produced wine, cheese, figs, and every species of grain, in abundance. Its chief river was the Langarius, which traversed its territory from south to north. The Bithynians were originally averse to an urban life, and

Bithynia contained in the earlier ages no considerable towns save the Greek maritime cities of Astacus and Chalcedon. But in process of time the case came to be otherwise, and at the period when Theodosius divided the province it contained no less than 5 large and opulent cities, each governed by its own magistrates and laws. The western part of Bithynia is now called Khudawendkiar, and that part contiguous to the Euxine and Bosphorus Kojali.

BITON and OLEOBIA, according to the old Greek tale, 2 brothers, sons of Cydippe, priestess of Juno in Argos. In Herodotus, their story is told by Solon to Croesus, for the purpose of proving that it is better to die than to live. On one occasion (the story runs), the oxen who usually drew the chariot of the priestess not being at hand, these youths, in their zeal, supplied the place of the animals, and dragged their mother in her chariot to the temple, a distance of about 5 miles. Wishing them to be rewarded for their filial devotedness, Cydippe prayed to Juno to grant to her 2 sons what was best for mortals. That night the brothers slept in the temple, and never woke. This was the greatest boon the goddess could grant.

BITONTO (anc. *Bituntum*), a town in the province of Bari, in the kingdom of Naples; pop. 16,250. A victory was gained here by the Spaniards over the Austrians, May 25, 1734, which gave the former possession of the kingdom of Naples.

**BITTER PRINCIPLES** (also called when evaporated to the consistence of sirup **BITTER EXTRACTS**), substances extracted from plants by digestion in water, alcohol, or ether, and which possess in concentrated form that which gives the bitter taste to plants, and which was formerly referred to a hypothetical substance called the bitter principle. Excepting this, these extracts do not appear to possess other characteristic properties in common; their nature, however, is not very well understood. From some plants the bitter extractive is obtained in white crystalline grains, as the *cetraria*, from the Iceland moss (*cetraria islandica*); sometimes in rhombic prisms, as *asparagin*, from asparagus, and *calumbin*, from the calumba root; and from numerous other plants it assumes the forms of white needles, pearly plates, yellowish white masses, brownish and yellowish red matter, uncrystallizable, in crystals of 4 and 6 sided prisms, and, in the case of the *lupulin*, or *bitter matter of hops*, in powder of reddish yellow color. Some of the numerous varieties of bitter are soluble in water; some only in alcohol or ether. They are generally neutral in their properties, uniting neither with acids nor bases. The bitter extracts are used in medicine as tonics, and also as aperients; and in the manufacture of malt liquors, they are employed to impart their bitter flavor to these. Their presence renders food, particularly that which is of a glutinous nature, more digestible and nutritious; and the action of the stomach,

when impaired by previous disease or exhaustion, is rendered active and healthy, the benefit of which is experienced in the sympathetic action of other parts also of the system. The appetite is improved by their use, and the quantity of blood is increased. These effects indicate the cases in which the use of bitter drinks may be beneficial, as well as those also in which they may prove of serious injury. Their excessive use is liable to induce apoplexy, or palsy, the fate of the greater proportion of malt liquor drunkards.

**BITTERN**, the bitter, or so-called mother liquor, which remains after the salt is deposited from the briny waters of salt works. The uncrystallizable fluid contains chloride of magnesium, from which the commercial sulphate of magnesia may be prepared by decomposing the salt with carbonate of soda, or with the purified ammoniacal liquor of gas works; the bittern is commonly thrown away as useless. An analysis of a sample from the salt works on the Kiskiminetas river, above Freeport, Penn., is given by M. H. Boyé, M. D., in the "American Journal of Science," 2d series, No. 19, as follows:

In 100 parts of the water.	
Chloride of Potassium,	0.138
Chloride of Sodium,	0.877
Chloride of Calcium,	24.640
Chloride, with } Magnesium,	10.146
Bromide and } Iodide of }	
Water,	64.209
	100.000

The specific gravity of the liquid was 1.889.—The name is also given to a very bitter compound of quassia and cocculus indicus, used by fraudulent brewers in adulterating beer.

**BITTERN** (*ardea*, Linn.), a fen fowl, of the order *grallatores*, or waders; family *gruidæ*, or allied to the cranes; genus *ardea*. There are several varieties of this bird, which is nearly allied to the herons, in Europe, the most common of which, the English bittern, is famous for the peculiar nocturnal booming sound which it emits in the deep watery morasses of which it is an inhabitant, to which sound it owes several of its provincial names, as the bog-bumper, mire-drum, &c. The noise is very peculiar, and can hardly be mistaken when once heard; the popular impression is that the bird, when making it, thrusts its long bill into the mud, and forces its voice through that medium and the superincumbent water; but, like most popular impressions on natural history, it is utterly unfounded. In the United States there are 3 varieties of the American bittern: *A. minor*; the green bittern, or green heron (*A. virescens*), very common in all inland streams and mill ponds, a beautiful bird, but commonly known by a vulgar and indelicate nickname; and the least bittern (*A. exilis*), an extremely small and beautifully marked little bird. All the bitterns are handsome birds, with long necks, which they hold proudly erect, fine pendulous but erectile crests, a long fringe of fea-

thers on the neck, mottled with yellow, brown, and black, like tortoise shell, and all their upper parts variegated with black, brown, rust-colored, yellow, and white, like those of the woodcock. Their long legs are bare far above the knees, to enable them to wade into deep water, in pursuit of their fishy and reptile prey. They have a fine, clear, penetrating eye, with a fearless, defying look, which well expresses their bold and self-relying character. If wounded or broken-winged, they will fight bravely with their sharp-pointed bills, striking at the eyes either of men or dogs, to the latter of which they are formidable antagonists. Their voice is a harsh *qua-ak*; their flight slow and heavy, with their long legs outstretched behind. Their habits are nocturnal; their haunts, fresh-water pools, stagnant rivers, and morasses; they build, like the heron, in trees, ordinarily raising 2 young ones. Their food is small fish, lizards, frogs, and frog spawn, of which they are voracious consumers. They are good eating in September, when the first frosts are commencing, and are eaten roasted, with currant jelly and stuffing, like the hare, which they somewhat resemble.

**BITTOOR**, **BITHOOR**, or **BITOOR**, a town of Bengal, province of Allahabad, on the Ganges, 12 miles N. W. of Cawnpore; pop. 18,580. As a military post it is of little consequence, but as a religious city it enjoys high repute, and every year in November and December is the scene of a festival wherein piety and traffic are curiously intermingled. Beside a number of Hindoo temples it has magnificent ghats, or flights of steps, on the brink of the sacred river where the priests and worshippers of Brama perform their prescribed ablutions. One of these ghats is held to have been honored by the presence of Brama himself, who there sacrificed a horse after creating the universe. A pin fixed in one of the steps and firmly believed to have dropped from the god's slipper on that occasion, is still an object of deep veneration. For a long period this town was the residence of the chiefs of the Mahrattas, the last of whom died without issue in 1851. His estate then reverted to the East India company, to the exclusion of the claim of an adopted son, Dhundoo Punt, who was, however, permitted to occupy the town, and is best known as the rajah of Bittoor, or by his title of the Nena Sahib. It is to the fearful interest which centres in this man, as a leader of the sepoy mutineers in 1857-'58, that the place now owes its chief celebrity. In June and July, 1857, 2 parties of Europeans, mostly women and children, who had escaped down the river from Furruckabad or Futtehghur, are said to have been captured by him opposite Bittoor and put to death. In July, Gen. Havelock drove the Nena from the town and dismantled it; it was subsequently reoccupied by the mutineers, and after a well-fought battle again taken by Havelock, Aug. 16, 1857.

**BITUMEN**, a generic name for a variety of substances found in the earth, or exuding from

it upon the surface, in the form of springs. The liquid varieties become inspissated by exposure, and eventually harden into the solid form, which is asphaltum. The bitumens burn with a flame and thick black smoke, giving out the peculiar odor called bituminous. Some of the impure fluid bitumens, and the solid variety when melted, closely resemble coal-tar. They are distinguished from bituminous coal in giving no ammonia, or mere traces of it, by distillation, and in developing negative electricity by friction without being insulated; also when ignited upon a grate, the bitumens melt and run through at the temperature of about 220° F., but the coals burn to ashes. In melting, volatile fluids escape from them with no swelling up other than that due to ebullition. This property of dividing by heat into fluids and solid residues having a porous form, assimilates the bitumens to ordinary turpentine and tar, and renders them unsuitable for producing gas economically. In boiling water the bitumens soften, adhere to the sides of the vessel, and give off naphtha; coal undergoes no change. The bitumens, again, dissolve perfectly in spirits of turpentine, benzole, rosin oil, linseed oil, and sulphuric ether; while coal, after long digestion in the oils, only colors the liquid brown, and to the sulphuric ether imparts a naphtha-like fluid and a resinous body. The bitumens decompose nitric acid, coal does not; they combine with sulphuric acid, coal is not affected by it. Dropped upon melted tin, temperature 442° F., the bitumens decompose and give off copious fumes; coal is unaltered. Most of these points of difference were given in evidence by Dr. A. A. Hayes and Dr. O. T. Jackson of Boston, in an important suit tried in New Brunswick, to test the title to the Albert coal-mining property, this turning on the point whether the product was coal or asphaltum. Dr. Ure notices that the fluid bitumens differ from the coal-tar in not producing the 6 substances extracted from the latter by Mr. Mansfield, and named by him alliols, benzole, toluole, camphole, mortuole, and nitro-benzole.—The varieties of bitumen commonly described are: the liquid oil, naphtha, or in its more impure form, *petroleum*; the viscid pitchy bitumen, which passes into the black resinous *asphaltum*; and the elastic bitumen, or elaterite of the mineralogists. The last is also called mineral caoutchouc, from its property of rubbing out pencil-marks. It was first found in the deserted lead mine of Odin, in Derbyshire, by Dr. Lister, in 1672, and was called by him a subterranean fungus. It occurs in soft flexible masses of blackish brown colors and resinous lustre, and consists of about 85 per cent. of carbon, and the remainder hydrogen with probably some oxygen. Compact bitumen or asphaltum has already been noticed; see **ASPHALTUM**. Further consideration, however, will be given to it in this article in treating of the uses of the bitumens. *Chapapote* is an asphaltum found in abundance near Havana, and elsewhere in the island of Cuba. It appears to be a consolidated petroleum, a

liquid variety of which is often seen near it oozing through the fissures of the limestone rocks. The solid product is of jet black color, and gives a brown powder, and a strong but not unpleasant odor. Its specific gravity is given by Dr. Hayes at from 1.165 to 1.170. It melts in boiling water into a thick liquor, and forms a scum upon the surface. Alone, it melts at 214° F. into a uniform fluid, which may be poured from one vessel to another; calcined in close vessels, it swells and leaves a very light coke; dissolved in spirits of turpentine, it makes a coarse varnish. Brown colored and viscid oils are extracted from it. Petroleum and naphtha are fluid substances, called also rock oil, which flow up through fissures in the rocks, and collect in low places, and are found floating upon the surface of the waters of lakes. When indurated and oxidized by exposure, they are asphaltum. The purer form, called naphtha, is very common in many parts of the world, and in numerous places is turned to good account as a fuel, and also for illumination. On Oil creek, Venango county, Pennsylvania, it was formerly collected by the Seneca Indians, and sold by the name of Seneca or Genesee oil. Similar springs are well known in Chautauque, Erie, Cattaraugus, and Seneca counties of New York. Carburetted hydrogen gas issues with the oil, and this is so abundant that the town of Fredonia, in the first-named county, is lighted with it, and it affords the illuminating gas for the light-house of Portland harbor on Lake Erie. At Rangoon, in Burmah, there are upward of 500 naphtha wells, from which 412,000 hogheads of oil are annually obtained. This interesting form of bitumen will be more particularly described, and more localities cited, under the article NAPHTHA. These different varieties of bitumen are found only in the secondary and tertiary formations. If they occur at all in the primary rocks, it is merely in veins and fissures, which probably have been filled long after their formation. They are very generally met with in connection with salt springs, or mines of rock-salt. Near volcanoes, petroleum is often seen issuing with the waters of springs, or floating upon the sea, furnished from springs at its bottom. The ancient Babylonians obtained the imperishable cement for their structures from the fountains of Is, which is the modern Hit, on the right bank of the Euphrates. These still continue to pour out inexhaustible supplies, mingled with the strongly saline and sulphurous waters. Common salt is also prepared here from the brine springs. The water of the springs has a temperature of about 160° F. As it flows slowly along a conduit, the oily bitumen gathers on the surface, and is skimmed off and laid in pits exposed to the air, in which it speedily hardens into flakes of about an inch thick, which are sold at Hit for about 5 cents the cwt. It is much used for covering the houses and boats of the region. The rock formation is an argillaceous limestone, over which is found in some places a coarsely granu-

lar gypsum. These fountains are celebrated as having attracted the attention of Alexander the Great, Trajan, and Julian. The bituminous products of the Dead sea in Judea have been referred to in the article ASPHALTUM. They are collected on the east and west sides of the lake, and are supposed to be derived from a bed of bitumen at the bottom. The pieces resemble pitch, and though one-seventh heavier than pure water, float upon the saline water of the Dead sea, the specific gravity of which is 1.23. They melt in boiling water, and when distilled yield a volatile oil, some water, and traces of ammonia. The residue consists of charcoal, amounting to  $\frac{1}{4}$  of the weight of the asphaltum,—its ashes composed of silica, alumina, oxide of iron, and traces of lime and manganese. It is from this locality the name Jews' pitch has been given to asphaltum.—In the island of Trinidad, in the West Indies, there is a famous lake of asphaltum and petroleum called Tar lake, or by the French *Le Brai*, from its material answering the purposes of pitch, and possessing this additional advantage, that it keeps off the tere-do or borer, which in warm climates is so destructive to the timber of ships. This is described by Manross, an American who visited it, as being about  $\frac{1}{4}$  of a mile back from the sea, separated from it by an elevated tract of land, the surface of which is covered with hardened pitch, upon which trees grow. About Point Le Brai the masses of pitch appear like black rocks among the foliage. The lake seems to be about a mile and a half in circumference. It is underlaid by a bed of coal. Near the shores the bitumen is solid and cold, appearing as if it had cooled from the liquid when boiling up in large bubbles. Toward the middle of the lake the temperature increases, the bitumen becomes softer, and in the centre is boiling. The English authorities describe the lake as of circular form, and 8 miles in circumference; they say nothing of the coal-bed nor of the lake boiling in the centre. It appears at a distance like water, but near by like a lake of glass. In approaching, a strong sulphurous smell is perceived at the distance of 8 or 10 miles. When the weather is hot and dry, the surface of the lake is so soft and sticky one cannot walk upon it. A foot below the surface it becomes softer, and contains an oily substance in little cells. Specimens of this bitumen, which were regarded as pure, and taken to Europe, were examined by Mr. Hatchett, who found them to consist of a porous and argillaceous stone thoroughly impregnated with bitumen. It does not burn readily, but becomes plastic by a slight increase of temperature. Bitumen is also found disseminated through calcareous and sandstone rocks, and saturating slates and shales. Nearly all the varieties of it are liable to have many impurities mixed with them, and all contain volatile oils and water. The bitumens are purified by first boiling them with water. The sand and other mineral substances fall to the bottom, and the bitumen

floating or sticking to the sides of the boiler is skimmed off and put into another boiler, by which more water is separated. It is then boiled by itself for some time, and is entirely freed from water and oils and the solid impurities, which subside to the bottom. It is thus obtained in the form of a thick fatty pitch, ready to be barrelled for the market or applied to its uses.—The results of the ultimate analysis of the pure natural bitumens, whether liquid or solid, vary but little from 88 per cent. of carbon and 12 of hydrogen. A solid bitumen of Coxitambo, near Cuenca in Ecuador, gave 88.7 per cent. of carbon, and 9.7 of hydrogen, with 1.6 of oxygen and nitrogen. Nitrogen is usually present to the extent of a trace, and in the solid asphaltum it has been found to the extent of 12 per cent., and oxygen also in the same variety about 8 per cent. By treating asphaltum with different solvents, three distinct bodies may be separated. Water dissolves nothing. Anhydrous alcohol dissolves a yellow resin equal to  $\frac{1}{10}$  of the weight of the asphaltum; this is soluble also in ether. The residue insoluble in alcohol, treated with ether, yields a dark brown resin, which is separated by evaporating the ether. It amounts to  $\frac{1}{10}$  the weight of the asphaltum. It dissolves easily in volatile oils, and in oil of petroleum. The latter also, as well as turpentine oil, takes up the residue which the ether leaves.—The following formulas, exhibiting the composition of petroleum and asphalt, are given by Dr. Muspratt, as setting forth in a striking manner the derivation of the latter by oxidation of the former:

Naphtha, or Petroleum..... $C_{10} H_{16}$ , or  $C_{12} H_{22}$   
 Asphalt, or Bitumen..... $C_{16} H_{22} O_2$

Great expectations have been entertained of the important uses to which the natural bitumens might be applied; and in France, particularly, where several qualities of asphaltum are found, there appears to have prevailed quite a speculative fever in introducing those substances to a great variety of purposes in the arts and manufactures, so that her large cities and capital have been spoken of as museums of asphaltic appliances. Though this excitement soon subsided, and the use of asphaltum was abandoned for many of the purposes proposed, it was proved to be admirably adapted for the construction of walks, terraces, roofs, and every kind of hydraulic work. The great Place de la Concorde is covered with a beautiful mosaic asphaltum pavement, and many of the promenades on the Boulevards with a clean thin bed of bituminous mastic; beside these, a great number of other public places have been similarly covered. As is well remarked by Dr. Ure, in treating of this subject: "It is a singular fact in the history of the useful arts, that asphalt, which was so generally employed as a solid and durable cement, in the earliest constructions upon record, as in the walls of Babylon, should for so many thousand years have fallen well-nigh into disuse among civilized nations." Its use

being recommended in the highest terms by this and other authorities, as preferable to that of coal-tar, which in this country has entirely superseded the employment of the natural asphaltum, it is well to give more consideration to this subject, than it would seem otherwise to require, particularly as in Cuba and Trinidad there are such large repositories of it, conveniently situated for its importation. It appears that in England several attempts have been made to construct carriage-ways of asphaltum and gravel, and the failure of these attempts has thrown discredit upon all uses of the kind for this substance. Now, it is not probable that it will prove a suitable material for the pavement of crowded thoroughfares; and, moreover, for whatever purpose it is used, it should be laid in dry weather, and be previously thoroughly prepared by boiling it for some time to expel all the water and volatile oils, both of which impair its useful properties, by causing it to crack. Neither of these requisites appears to have been regarded in the London attempts. The material most successfully employed in France for producing the bituminous mastic, is liquid bitumen mixed with a bituminous limestone, which is ground to powder, sifted and stirred into the boiling asphaltum, four parts of the stone to one of the bitumen. Dry, common limestone, or broken bricks, will answer as well. The mixture, when of homogeneous consistency, is poured out upon a table covered with sheets of paper, and upon which a square frame is placed for receiving the sheets of mastic. It is spread smoothly by a heated iron roller, sprinkled with sand, and left to cool. When laid, they are united by soldering with a hot iron. Coal-tar is often substituted for the natural bitumen, but it is considered far inferior to it in durability and strength. Dr. Ure says of them: "Factitious tar and pitch, being generated by the force of fire, seem to have a propensity to decompose by the joint agency of water and air, whereas mineral pitch has been known to remain for ages without alteration." The bituminous limestone is found at Val de Travers, in the canton of Neuchâtel, in the Jura limestone formation, corresponding to the English oolite. It consists of 80 per cent. carbonate of lime, and 20 per cent. of bitumen. It is tough, difficult to break with a hammer, and is excavated by blasting. Slightly heated, it exhales a fragrant odor, quite different from that of the factitious compounds. The carbonate of lime is so protected by the bitumen, that it does not effervesce with muriatic acid. In any artificial mixture it would be impossible to produce so intimate a combination of these substances, as is found in this natural asphalt rock. Silicious matters, as sand and smooth pebbles, are not so well adapted for the preparation of durable mastic as calcareous substances, as they have little attraction for the bitumen, and the mixture is liable to crack and crumble. Bitumen is also applied in the form of an external coating of mastic to give strength and protection to thin sheet-iron pipes and glass

tubes used for conveying water. To some extent asphaltum may be used as a fuel, especially for heating meters in gas works. It appears to have been a principal ingredient in the destructive Greek fire. (See FIRE, GREEK.) Bricks of poor quality saturated with it are rendered strong and impervious to water. It answers most of the purposes for which coal-tar is used. It makes the strongest cement for laying brick and stone work. The ancient Egyptians used some form of it for embalming bodies. The hardness of the mummies is probably owing to the combination of bitumen with the animal substances. It is useful for lubricating machinery and carriage-axles. Petroleum affords an oil and paraffine, and an English patent has lately been granted for a method of extracting them. In France a process has been patented for spreading fluid bitumen upon canvas sheets or netting, and passing it between metallic rolls, thus coating the cloth on one or both sides, and to any desired thickness. The use of the material is for lining buildings. In medicine, petroleum is employed as a sudorific and antispasmodic, and mixed with asafoetida it is a remedy for the tape-worm. It is applied externally for chilblains, cutaneous affections, chronic rheumatism, and affections of the joints. It is an ingredient in British oil. The Seneca oil was much used for an external application. Combined with soap, it gives to it an emollient property, which is very agreeable in hot climates, and, indeed, acts beneficially upon the skin in all climates. In the mechanical and chemical uses of the bitumens, it is likely we have yet much to learn; and it is probable that this substance will hereafter be much more advantageously employed for many purposes than we now have any idea of.—The origin of the bitumens has been regarded as very doubtful. Their composition would seem to refer them to vegetable matters, though they possess very marked differences from the coals. Their properties, however, may be changed by the different influences to which they have been subjected, and particularly to those of heated waters long acting upon them under great pressure, and combined with various saline bodies. They are often found in regions subject to earthquakes and volcanic action, and the causes that produce these must have unknown effects in modifying the bodies of mineral coal or vegetable collections they may come in contact with.

**BITUMINOUS SHALE**, a soft variety of argillaceous slate, found usually associated with coal. It contains a variable proportion of bitumen, sometimes so much of it, that it will burn. In Mansfeld, Germany, the bituminous schist found immediately over the new red sandstone contains also a small quantity of copper pyrites, and though it yields only 1½ per cent. of metal, it is made to pay a profit by the ore furnishing its own fuel for reduction. It is proposed to substitute it for animal black, in removing by its bleaching properties the colors of sirups,

it being composed, like bones, of an earthy and an organic constituent, and yielding a similar charcoal.

**BITZIUS**, ALBERT, a popular Swiss author, better known under the pseudonym of "Jeremias Gotthelf," born Oct. 4, 1797, at Morat, in the canton of Freyburg, died Oct. 22, 1854, at Lützelflüh, in the Emmen valley of the canton of Bern. In early life he officiated as pastor in Bern, and for some time took part in politics, but from 1837 till his death he devoted himself exclusively to literature. His writings consist chiefly of tales descriptive of the home life of Switzerland. A complete edition of his works in 12 vols. is in course of preparation at Berlin. Some of his tales are especially intended to illustrate the horrors of drunkenness, while others describe the results consequent upon a defective education. He was also the author of several popular almanacs.

**BIVALVE** (Lat. *bis*, twice, and *valva*, flap), a term in conchology, applied to shells which are composed of 2 valves, as the oyster, clam, &c. In botany it is applied to the seed-vessel, when this opens into 2 parts.

**BIVERI**, **BIVIERE**, or **LENTINI**, a lake of Sicily, 17 miles W. N. W. of Agosta. It is 19 miles in circumference, but during the heat of summer the greater part of it becomes a mere swamp. Its waters abound with eels, mullets, and other fish, in taking which 50 or 60 boats are constantly employed.

**BIVOUAC** (Fr., probably from Ger. *bei* and *wache*), an encampment of troops by night in the open air, without tents, each soldier sleeping in his clothes, with his arms by his side. In the warfare of the ancients, the troops were protected by tents, as by movable cities. In mediæval times, castles and abbeys were opened to feudal and princely armies as they marched by. The popular masses who, impelled by religious enthusiasm, precipitated themselves into the crusades into Asia, formed rather a mob than an army, and all but the leading knights and princes and their immediate followers bivouacked upon the ground, like the wild nomadic tribes who roam the plains of Asia. With the return of regular warfare tented camps again reappeared, and were common in Europe during the last 2 centuries. But in the gigantic Napoleonic wars it was found that rapid movements were of more importance than the health of soldiers, and the luxury of tents disappeared from the fields of Europe, excepting sometimes in the case of the English armies. Entire armies bivouacked around fires, or, if the neighborhood of the enemy rendered it necessary, without fires, sleeping upon straw, or perhaps upon the naked ground, a part of the soldiers keeping guard. Among historical bivouacs none has been more celebrated by poetry and painting than that of the eve of the battle of Austerlitz.

**BIXIO**, JACQUES ALEXANDRE, a French politician, born in 1808 at Chiavari, in the department of the Apennines. He studied medicine,

founded the *Revue des deux mondes* in conjunction with M. Buloz, and produced some agricultural works of repute. In 1848 he was in favor of a regency, and during the evening of Feb. 24 made vain efforts to prevent the decree which proclaimed the republic from being inserted in the *Moniteur*. Two days afterward he took office under the provisional government, and was sent as minister to Turin. Elected to the legislative assembly, he was zealous against the insurrectionary movements of May 15 and June 24. In the latter outbreak he was slightly wounded as he was rallying the soldiers after Gen. Bédan had fallen. Subsequently he was appointed vice-president of the assembly, and was 5 times reelected to that office. When Louis Napoleon became president, Bixio was made minister of agriculture and commerce, but in 8 days he retired. After the *coup d'état* of Dec. 2, 1851, he was kept 8 months in prison, and has not since mingled in public affairs.

**BIZERTA**, or **BENZERTA**, a fortified seaport in Tunis, on a gulf which communicates with a lake in the interior; pop. 10,000. The harbor was formerly commodious, but is now choked up with sand, and receives only small vessels. The adjoining lake abounds in fish, the roes of which, dried and formed into a substance called *botargo*, are an article of Mediterranean commerce.

**RJOERNSTJERNA**, **MAGNUS FREDRIK FERDINAND**, count, a Swedish statesman, born Oct. 10, 1779, at Dresden, died Oct. 6, 1847, at Stockholm. In 1793 he went to Sweden and entered the army, where he served in the war with Finland, and in Germany at the battles of Dessau and Leipsic, negotiated the capitulation of Lübeck with Gen. Lallemand, and after taking an active part in the military operations in Holstein and Norway he concluded the convention which established the union of Sweden and Norway. In Oct. 1812, he negotiated at London the sale of Guadeloupe. He was envoy in London from 1828 to 1846. His political opinions were moderate. He wrote a work on the theogony, philosophy, and cosmogony of the Hindoos, and another on the British rule in India.

**BJORKO**, a Swedish island on the lake of Mälär, 18 miles from Stockholm, with ancient gates, walls, and other ruins, which confirm the current belief that the island is the site upon which formerly stood the flourishing city of Björko.

**BLACAS**, **PIERRE LOUIS JEAN CASIMIR**, duke de, a French statesman, born Jan. 12, 1771, at Aulps, died at Göritz, Nov. 17, 1839. At the commencement of the revolution he emigrated, and returned to France with Louis XVIII. Sent to Rome as ambassador, Blacas negotiated the concordat of 1817. In 1820 he refused to be made prime minister. When Louis Philippe became king of the French, Blacas returned to exile and offered Charles X. his fortune.

**BLACK**. A substance is said to be black

when no color is reflected from its surface, but all the colors are absorbed.

**BLACK, ADAM**, a Scottish publisher, born in Edinburgh in 1764. In conjunction with his brother Charles, he established the publishing firm in Edinburgh, which for many years rivalled the establishments of Constable and Blackwood, and still continues in high repute as publishers of Sir Walter Scott's works, of the "Edinburgh Review" (in conjunction with the Longmans of London), and the "Encyclopædia Britannica," to the 8th edition of which Mr. Black has contributed several articles. He held and avowed liberal opinions at a time when they were unfashionable, and assisted to secure their triumph, very warmly joining in the movement to secure parliamentary and municipal reform. He was elected twice to the office of lord provost of Edinburgh, which he occupied from 1843 to 1848. During a visit to England, while holding that position, he declined the honor of knighthood, which was offered to him by the queen at the suggestion of Lord John Russell. In Feb. 1856, on the final retirement of Mr. Macaulay from the representation of Edinburgh, Mr. Black was unanimously chosen to succeed him, and was reelected in 1857, without opposition. As a legislator he has supported Lord John Russell's education bill of 1856, and advocates parliamentary reform and the vote by ballot. He is decidedly opposed to all religious endowments by the state. Mr. Black, though a good speaker, is rarely heard in the house of commons.

**BLACK, JEREMIAH S.**, United States attorney-general under President Buchanan, born Jan. 10, 1810, in the Glades, Somerset co., Penn. At 17 years of age he entered the law office of Chauncey Forward, in Somerset, an eminent member of the bar, and was admitted to the courts in 1830, being still in his minority. In April, 1842, he was appointed by the governor president judge of the judicial district in which he resided, and confirmed by the senate upon a strict party vote. In 1851, when a change in the state constitution made the judges elective, he was nominated as judge of the supreme court by the democratic convention, before which he was not a candidate. Of the 10 candidates named by the 2 parties, he obtained the largest popular vote. Under the mode of drawing provided by the constitution, a 3 years' term was assigned to him, and he became chief justice of the court. In 1854 he was reelected to this place, by a majority of 47,000 votes, though the candidate for governor on the same ticket was defeated by 37,000. On March 5, 1857, while engaged in the discharge of his judicial duties at Philadelphia, he received a telegraphic despatch from President Buchanan, tendering him the appointment of attorney-general of the United States. He has since appeared on behalf of the government, in a disputed land claim from California, involving an important principle upon which hundreds of similar cases depended. He achieved a great success, at once

establishing his reputation as a jurist with the court and the bar.

BLACK, JOHN, a London journalist, born at Dunse, in the county of Berwick, in 1788, died June, 1855. He received the ordinary Scottish parochial education, and commenced active life at the age of 14 in his native place, as errand boy. In his 18th year, he removed to Edinburgh, where he struggled for several years, chiefly as writing clerk in a lawyer's office. He taught himself Latin, Greek, and French, and also acquired German and Italian. In 1810, at the age of 27, he arrived in London, with 3 half-pence in his pocket, having walked the whole way from Edinburgh. He had a letter to Mr. Perry, of the "Morning Chronicle," who engaged him first as a parliamentary reporter, and, soon after, as translator of the foreign journals. In 1819, 2 years before Mr. Perry's death, Mr. Black rose to the position of principal editor of that journal, in which his fearlessness, tact, probity, and general knowledge were largely available. When the "Morning Chronicle" was sold (in 1823 to Mr. Clements, and to Sir John Easthope in 1834), Mr. Black was continued as editor, and retired in 1844. He was then in such distressed circumstances, that he was compelled to sell his large and valuable library, the collection of over 80 years. The leaders of the liberal party, whose opinions he had devoted his life to advocating, subscribed enough to purchase him an annuity, on which he lived in easy circumstances, until his death. Mr. Black, whom Cobbett delighted to call "the Scotch feelosopher," was a heavy political writer, fond of filling his articles with long extracts from old books, and fully persuaded that his duty as a journalist was to write all the "leaders" himself. Latterly he had the assistance of many able writers. Indeed, while the "Chronicle" was in Mr. Perry's hands, almost every "old whig" of note occasionally contributed to it. Mr. Black never wrote an original book, but translated Humboldt's work on New Spain, Leopold's "Travels in Norway and Lapland," Goldoni's "Autobiography," and Schlegel's "Lectures on the Dramatic Arts and Literature."

BLACK, JOSEPH, a Scotch chemist, born of Scotch parentage at Bordeaux, in France, in 1728, died in Edinburgh, Nov. 26, 1799. He was sent in his 12th year to prosecute his studies at Belfast, and 6 years later to the university of Glasgow, where he displayed a fondness for physical science, selected the profession of medicine, and became the favorite pupil of Dr. Cullen, under whom he made great progress in chemical studies. Physicians and chemical professors were at that time discussing the cause of the causticity of lime and the mode of its action as a lithontriptic medicine, and Mr. Black, as the assistant of Dr. Cullen in his chemical operations, began to make experiments upon this subject, which he continued with ardor after his departure to the university of Edinburgh, where he took his medical degree

in 1754. It had formerly been supposed that quicklime held in absorption some igneous particles or something of an igneous character, but the investigations of Black led him to the discovery that the causticity of the calcareous earths was not derived from any combination, but was their peculiar property, and that they lost this property when they combine with a certain portion of air, to which he gave the name of fixed air, but which is now known as carbonic acid gas. This discovery, which forms an era in the history of chemistry, and opened the way for the experiments of Priestley, Cavendish, and Lavoisier, was stated and explained by Black in his dissertation when he received his medical degree. Dr. Black was invited in 1756 to succeed Dr. Cullen at Glasgow, the latter having removed to Edinburgh, and in this position he made his second and most important discovery. Ice, he observed, being converted into water, absorbs a large amount of heat, the existence of which is no longer indicated by the thermometer. Water being converted into vapor absorbs another large amount of heat, which is in like manner lost to the senses or the thermometer. To change a solid into a fluid, or a fluid into a gas, a quantity of heat has to lose its existence, as it were, in the newly created state of the body. On the other hand, heat is given out when a gas is liquefied, or a liquid solidified; that is, the heat which was apparently lost when the solid was made a liquid, becomes sensible again when the liquid is made a solid; and the same is true, also, of the change from a gas to a fluid. Thus a freezing process is always a warming process to the things which are nearest it, because the heat which was lost in the fluid is let loose when the solid is formed. On the other hand, a melting process is always a cooling process to the things in the neighborhood, because to melt a substance a large amount of heat has to be sacrificed, and this heat is abstracted from the nearest bodies. Thus, on a sunny spring day in the north, when the snow is melting, there is always a raw chill in the air, because the heat is constantly taken out of the air to change the snow into water, and becomes insensible in the latter. Dr. Black, observing these phenomena, said that the heat is concealed (*latet*) in the water and vapor, and introduced the name and the theory of latent heat. This discovery suggested to Watt, who was a pupil of Black, his improvements in the steam engine. In 1766, Dr. Black was again made the successor of Dr. Cullen, being appointed to the chemical chair of the university of Edinburgh. Impressed with his responsibility as a lecturer before the large concourse of students who frequented that university, he made no further investigations, devoting himself exclusively to the preparation of his lectures, and so great was his success that he made chemistry a fashionable study at Edinburgh, and a branch of a polite education. His lectures were resorted to by the gentlemen of the capital and

by men of science from all parts of Europe. It is a curious fact that Dr. Black, having given up experimenting for lecturing, combated for several years results which other chemists had legitimately founded upon his own discoveries. A feeble constitution obliged him to husband his strength in his later years, and, unable to develop his views with the completeness and nicety which he desired, he desisted at length from any attempts at composition, and various continental chemists put forth in their own names the ideas which they had received in the lecture-room of Dr. Black. His only publications were 8 dissertations, giving an account of his experiments on magnesia, quicklime, and other alkaline substances; his observations on the more ready freezing of water that has been boiled; and his analysis of some boiling springs in Iceland. His death occurred while he was sitting at table, and so gently that he did not drop the glass of milk which he held at the moment in his hand, but rested it upon his knee, and was, at first, thought to have fallen asleep.

**BLACK ASSIZE**, a judicial sitting of the courts held at Oxford in 1577, and rendered historical by the pestilential and deadly fever which was introduced into the court from the gaol, and swept away judges, jurymen, and counsel, and extended itself into the town and neighborhood. The superstitions of the age invested it with a special character, and it was remarked that no women nor poor people died of it.

**BLACK BAND**, the name given by Mushet to certain layers of argillaceous carbonate of iron of the coal formation found near Airdrie, E. of Glasgow, as also in other parts of Scotland, and in Wales, and which, until he called attention to them, had escaped notice. They are of the common variety of this ore, only of a darker color than usual, and in blocks of pretty regular thickness. The great extent and convenient access of the beds in Scotland, together with their occurrence near beds of coal and limestone, have given to this ore an importance due neither to its percentage of iron nor to the quality of the metal it produces. It may be also that its value is somewhat enhanced by the mixture of bituminous and coaly matters, which renders a less amount of fuel necessary to produce the iron. A rich specimen of it, of specific gravity 3.0583, analyzed by Dr. Colquhoun, gave: per cent. carbonic acid, 85.17; protoxide of iron, 59.08; lime, 3.33; magnesia, 1.77; silica, 1.4; alumina, 0.63; peroxide of iron, 0.23; carbonaceous or bituminous matter, 8.08; moisture and loss, 1.41. Its percentage of metallic iron is 41.25.

**BLACK COPPER**, the crude metal produced by the first smelting of copper ores, and which requires subsequent melting and refining to convert it into merchantable copper. It is sometimes conveniently and rudely prepared in cheap furnaces near the copper mines, as the easiest method of concentrating the metallic portions of the ore and reducing the cost of transporta-

tion to distant markets. It generally contains from 70 to 95 per cent. of copper, mechanically mixed with metallic iron and a small proportion of other foreign matters.

**BLACK DEATH.** See **PLAGUE**.

**BLACK FEET**, a powerful Indian tribe at the foot of the Rocky mountains, and between the Yellowstone river and the Missouri. They are one of the most powerful and formidable tribes in the western territory, and, until recently, have given much trouble to the government, which, on more than one occasion, has found it necessary to send troops to overawe them. Against them the famous expedition to the Yellowstone, in 1826 and 1827, under command of Gen. Atkinson, was directed. They are said to number about 10,000 warriors, but as they receive no annuities from the government but little care has been taken to obtain a correct census. They are great robbers and depredators, and furnish large quantities of furs, &c., to the American traders, who have a station on the Yellowstone at the falls. They seem to have more affinity in language and customs with the tribes west than east of the Rocky mountains.

**BLACK FLUX**, a mixture of carbonate of potash and carbon in a state of the finest division. It is prepared by intimately mixing 1 part of nitre with 2 to 3 parts of crude tartar or cream of tartar, and deflagrating the mixture by dropping ignited charcoal into it. When the chemical action has ceased, the black product is ground in a mortar, passed through a fine hair-sieve, and then put away for use. It must, from its property of deliquescent on exposure to the air, be kept in well-stopped bottles. It is employed as a flux in reducing ores of metals, particularly of lead and copper; and it has the properties both of the reducing and of the desulphurizing fluxes. See **FLUX**.

**BLACK FOREST**, the south-western extremity of the ancient Hercynian forest, called by the Romans *Sylva Martiana*, and which received during the middle ages the name of Schwarzwald or Black Forest. It is a range of woody mountains in the south-western part of Germany, traversing the territories of Baden and Würtemberg, and forming the eastern boundary of the basin of the Rhine. It extends 85 miles in length, almost parallel with the course of the Rhine, from which it is distant in many places not more than 20 miles, and has a breadth in its southern part of about 30 miles, and in its northern part of about 18. The Black Forest consists rather of elevated plains or tableland, than of insulated mountains, and describes itself upon the horizon in regular undulating lines without any of those sudden peaks and notches which mark the summits of the Alps and Pyrénées. Its greatest elevation is near and to the east of Freiburg, in the region where the Wiesen takes its rise, and where is the famous defile called Hell, a narrow valley surrounded by lofty mountains, and celebrated in the retreat of Moreau in 1796. The highest summits, the Feldberg, the Belchenberg, and

the Kandel, are between 4,000 and 5,000 feet above the level of the sea. The descent of the Black Forest toward the Rhine is very abrupt, causing the rivers which take their rise on this side, the Murg, Kinsig, and Eltz, to swell gradually during the rains, and to merit, until their union with the Rhine, the name of capricious torrents. The eastern slope is very gentle, and gives rise to the Neckar and the Danube, the former soon changing its direction to the north and west, and joining the Rhine, the latter receiving numerous tributaries from the Alpine systems as it continues its course to the east. The Black Forest is composed mainly of granite, though the surface is in some places covered with sandstone, and gneiss appears around its base. On some of the heights porphyry is found, and there are many mines of silver, copper, iron, lead, and cobalt. Its mineral waters too, especially those of Baden and Wildbad, have a European celebrity. The summits of the Black Forest are during 8 months of the year covered with snow; they are generally destitute of trees, and except during the greatest heats of summer display no verdure. Descending from the top, the first trees that appear are the pine, the beech, and the maple, which are succeeded by the dense forests of fir with which all the middle and lower parts of the mountains are covered. These firs make the timber of ships for navigating the Rhine, and also furnish those forests of masts which fill all the great ports of Europe. Here, near the foot of the mountains, are many picturesque valleys, of which that of the Murg, situated near the thermal waters of Baden, is particularly distinguished for its natural beauty. Villages and hamlets are interspersed, and the inhabitants are mainly engaged in rearing live stock, trading in timber, and in the manufacture of numerous toys, which are spread over the world for the amusement of the youthful generation. The most famous of these is the wooden clock, of which it is estimated that the number of 180,000 are annually distributed through Europe and America. Agriculture is there of little importance, the soil being unfruitful and the climate severe, yet the valleys produce excellent fruits.—The middle and more recent ages have left traces of their history on the whole range of the Black Forest. Abbeys and castles stand in decay, the monuments of a past greatness, and pious and poetic legends hover about their ruins. There is the castle of Geroldseck, founded, if tradition be true, by the brother of Charlemagne; the castle of Stauffenburg, once occupied by a bold knight, the lover of an Undine or water-spirit; the 2 castles of Baden, one in ruins, transformed into a park and made open to all, the other near by, built over a dungeon in which the Vehmic tribunal used to meet; the castle of Yberg, ill-famed in the mouths of the people, because an impious and rapacious knight had there exhumed the bones of one of his ancestors to find treasure; and the castle of Roeteln, in the vale of Wiesen,

the abode of Hebel, the German song writer. These traditional attractions, joined to its beautiful scenery and its mineral waters, make the Black Forest, despite its unpropitious name, a most interesting locality. The peculiar industry and simplicity of the inhabitants, some of them constructing children's playthings in cottages, some guiding rafts of timber down the mountain torrents, give an additional interest. Agreeable sketches of home-life in the Black Forest may be found in the tales of Berthold Auerbach.

**BLACK GUM**, the arbitrary name of a tree without gum, a species of *nyssa* or *tupelo* of Adanson, which is the only genus of Endlicher's suborder *nyssaceæ* of his order *santalaceæ*. Linnæus had it in *polygamia diœcia*; Elliott placed it in *diœcia pentandria*, and Darlington in *pentandria monogynia*. The black gum is the *N. multiflora*, and is known in New England as snag-tree and hornpipe; in New York as pepperidge, and as the gum-tree in the middle states. It thrives in low, clayey soil, and in dense forests grows to 40 feet high. Its external habits are various, and it is often confounded with other trees. It has very many branches, which are often crooked; a dense pyramidal head; leaves 1 to 5 inches long, and of a lustrous green, in tufts of 4 or more at the ends of the branches; greenish flowers in clusters, ripening to blue-black; mouse-colored bark in longitudinal furrows; wood close and tough, resists splitting, though it decays sooner in the weather than that of the elm. The wood is used for water-pipes in the salt works at Syracuse; it is also good for hatters' blocks, wheel naves, and cog-wheels. The tree is very vigorous; it was introduced into Europe as an ornamental tree in 1739; it thrives in the south of England, and even in Hanover.

**BLACK HAWK**, a N. E. central county of Iowa, with an area of 576 sq. miles, divided by Cedar river into nearly equal parts. The surface is occupied mainly by prairies, though portions of it are well wooded. The productions of the county in 1856 amounted to 217,168 bushels of Indian corn, 26,821 of wheat, 2,365 tons of hay, 36,567 lbs. of butter, and 5,904 lbs. of cheese. Pop. 5,538.

**BLACK HILLS**, the name given to a mountain range of Missouri territory. Commencing near the Missouri river, in lat. 47° N. and long. 108° W., it stretches along this meridian to about 43° N. lat., after which it suddenly changes its course to the west, and is finally lost among the Rocky mountains. On the W. side of this range are the tributaries of the Yellowstone river; on the E. and S. the affluents of the Missouri and the Platte. Laramie Peak is the highest known summit; it has an elevation of 8,000 feet above the sea. Recent explorations have shown the Black Hills to be much nearer the Missouri river than was formerly supposed.

**BLACK HOLE**, a small close dungeon in Fort William, Calcutta, which will long be re-

membered as the scene of one of the most tragical events in the history of British India. On the capture of Calcutta by Surajah Dowlah, June 20, 1756, the British garrison, consisting of 146 men, under the command of Mr. Holwell, were taken prisoners and locked up for the night in the common dungeon of the fortress, a strongly barred room, 18 feet square, and never intended for the confinement of more than 2 or 3 men at a time. There were only 2 windows, both opening toward the west, whence, under the best of circumstances, but little air could enter. Add to this that a projecting verandah outside, and thick iron bars within, materially impeded what little ventilation there might be, while conflagrations raging in different parts of the fort gave the atmosphere an oppressiveness unusual even in that sultry climate, and we may form a faint idea of the sufferings of these unhappy creatures, exhausted with previous fatigue, and packed so tightly in their prison that it was with difficulty the door could be closed. A few moments sufficed to throw them into a profuse perspiration, the natural consequence of which was a raging thirst. They stripped off their clothes to gain more room, sat down on the floor that the air might circulate more freely, and, when every expedient failed, sought by the bitterest insults to provoke the guards to fire on them. One of the soldiers stationed in the verandah was offered 1,000 rupees to have them removed to a larger room. He went away, but returned saying it was impossible. The bribe was then doubled, and he made a second attempt with a like result; the nabob was asleep, and no one durst wake him. By 9 o'clock several had died, and many more were delirious. A frantic cry for water now became general, and one of the guards, more compassionate than his fellows, caused some to be brought to the bars, where Mr. Holwell and 2 or 3 others received it in their hats, and passed it on to the men behind. In their impatience to secure it nearly all was spilt, and the little they drank seemed only to increase their thirst. Self-control was soon lost; those in remote parts of the room struggled to reach the window, and a fearful tumult ensued, in which the weakest were trampled or pressed to death. They raved, fought, prayed, blasphemed, and many then fell exhausted on the floor, where suffocation put an end to their torments. The Indian soldiers, meanwhile, crowded around the windows, and even brought lights that they might entertain themselves with the dreadful spectacle. The odor which filled the dungeon became more deadly every moment, and about 11 o'clock the prisoners began to drop off fast. At length, at 6 in the morning, Surajah Dowlah awoke, and ordered the door to be opened. Of the 146 only 23, including Mr. Holwell (from whose narrative, published in the *Annual Register* for 1758, our account of this event is partly derived), remained alive, and they were either stupefied or raving. Fresh air soon re-

vived them, and the commander was then taken before the nabob, who expressed no regret for what had occurred, and gave no other sign of sympathy than ordering the Englishman a chair and a glass of water. Notwithstanding this indifference, Mr. Holwell and some others acquit him of any intention of causing the catastrophe, and ascribe it to the malice of certain inferior officers, but many think this opinion unfounded. Holwell and 8 others were sent prisoners to Muxadavad; the rest of the survivors obtained their liberty, and the dead bodies were carelessly thrown into a ditch. The Black Hole is now used as a warehouse, and an obelisk, 50 feet high, erected in memory of the victims, stands before the gate. It was struck by lightning some years ago, and has since been gradually falling to ruin.

**BLACK JACK**, a term loosely applied by miners to blende, the sulphuret of zinc, or to any other ore which resembles it in being obnoxious to them, if in no other respect.—It is also the name commonly given in the southern states to a small species of oak tree (*quercus stellata*), also called post-oak, for its being, when full grown, of a convenient size for making posts.

**BLACK LEAD**, an incorrect name for GRAPHITE, which see. It contains no lead, and has no relations with lead ore.

**BLACK LETTER**, a term applied to the old English or modern Gothic letter, in which the early manuscripts were written, and the first English books were printed.

**BLACK MAIL**, a tribute formerly paid by the occupants of lands in the northern counties of England to some Scottish chieftain for protection against the depredations of border rieviers or moss troopers. By the terms of the arrangement the borderer receiving this tribute was bound not merely to abstain from injury to the person paying it, but also to recover his property if taken by others—hence it has been called protection rent. (See Scott's introduction to "Border Minstrelsy.") At a later period, after civil order had been established in the border counties, and agriculture and peaceful habits prevailed in the lowlands of Scotland, the custom of paying black mail to the highland chiefs by the lowland farmers became common, and continued till within a century. Some incidents of this custom are related in 2 of Scott's novels, "Waverley" and "Rob Roy." The origin of the term seems to be this: mail in the old Scottish law was used for rent of an estate. It seems to have been the name of a small coin in England and Scotland. Black mails may be considered therefore as equivalent to black rents, which were payable in kind, that is, what was produced by the estate; being the same as the *reditus nigri*, in contradistinction to the *reditus albi*, which were payable in silver.—The modern sense of the phrase is mainly derived from the fact that such rent was paid to robbers and thieves as the price of immunity; hence now used for money paid under any extortion, especially when the injury sought to be guarded

against is one for which there is no adequate protection by law. It generally implies a corrupt speculation out of some advantage which it is unconscionable to use. It is also sometimes used for money paid to prevent an exposure of some wrong doing, being in this sense what is called hush money.

**BLACK MOUNTAINS**, the culminating group of the Appalachian system, already referred to in the article **APPALACHIAN MOUNTAINS**, named from the dark growth of balsam-firs and other evergreens which cover their summits. Their position is in Yancey and Buncombe counties, North Carolina, between the main central ridges on the west and a portion of the Blue Ridge on the east. Unlike the other ridges of the Alleghanies, they lie for the most part transverse to the general trend of the range, and give this direction to the great valleys and rivers included between them. They rise from a district of great elevation, the height of the valley at Asheville, on the French Broad river, being about 2,000 feet above the sea, and that of Toe river, at Burnsville, Yancey county, about 2,500 feet. From this plateau the drainage is toward the Ohio in a northerly direction by the branches of the Great Kanawha, by those of the Holston and the French Broad toward the south-west, and by those of the Yadkin and the Catawba into the Pedee and Santee toward the south-east. This position at the sources of streams flowing in such diverse directions, long since pointed out this district as probably the most elevated east of the Rocky mountains. The distinguished botanists, Michaux, father and son, were led to the same opinion by their observations upon the northern character of the forest growth with which these mountains are covered. In 1835, the first attempts to determine the elevation of the greatest heights were made by Dr. E. Mitchell, late professor at the university of North Carolina at Chapel Hill. The principal peak, which is known in North Carolina as Mount Mitchell, he estimated, according to the statements of his friends, by barometrical observations, to be 6,476 feet above the sea, calculating Morgantown, his base, to be 968 feet above tide. The late railroad surveys give this point an elevation of 1,169 feet, or of that where his stationary barometer hung about 1,200 feet, which would make the height of the peak about 6,700 feet. In 1844 he visited the locality again, and calculating from a base of more uncertain elevation at Asheville, he made the height 6,672 feet. In 1855, the Hon. T. L. Clingman of North Carolina made the elevation 6,941 feet, and in 1856 Prof. Guyot determined the highest point, which, as stated in the article **APPALACHIAN MOUNTAINS**, he then called the Black Dome, to be 6,760 feet high. The following are the elevations and names of the 12 highest points, all of which are higher than Mount Washington in New Hampshire, as published in 1857 from the investigations of Professor Guyot:

1. Clingman's Peak.....	6,701
2. Guyot's Peak, or Balsam Cone .....	6,661
3. Sandoz Knob.....	6,619
4. Hairy Bear.....	6,597
5. Cat Tail Peak.....	6,585
6. Gibbs's Peak.....	6,586
7. Mitchell's Peak.....	6,576
8. Sugar Loaf, or Hallback Peak.....	6,461
9. Potato Top.....	6,339
10. Black Knob.....	6,377
11. Bowler's Pyramid.....	6,245
12. Roan Mountain.....	6,318

The summit of Mt. Washington is 6,285 feet above the level of the sea. In 1857 Dr. Mitchell made a third excursion to these mountains, for the purpose of establishing his claim to having first measured the elevation of the highest summit, the honor of which was also claimed by the Hon. Mr. Clingman. He went well provided with several of Green's barometers, recommended by the Smithsonian institution, intending not only to make exact measurements of the highest point, but also, at the same time, to test in this latitude the formula adopted for barometrical observations. Before he had fixed, however, upon a series of points by the spirit level, preparatory to the observations with the barometer, the sad accident occurred by which he lost his life, as he was traversing alone one of the mountain ravines. His name is thus still more intimately associated with these high summits, by which one of them will long continue to be known.

**BLACK RIVER**, of New York, rises in Herkimer co., and after passing through Oneida and Lewis counties, changes its course at a place called Great Bend, passes by Watertown, and flows through Black River bay into Lake Ontario. Near Turin, in Lewis co., it has a fall of about 68 feet. Below the fall, it is navigable to Carthage, a distance of 40 miles. From Carthage to Watertown is a series of rapids, rendering navigation almost impossible. A canal has been opened, however, from the Upper falls to Rome on the Erie canal. The whole length of the river is 125 miles, and its breadth at Watertown (6 m. from its mouth) is 60 yards.—**BLACK RIVER**, or Big Black river, of Missouri and Arkansas, is the largest affluent of White river. It rises in the S. E. part of the former state, takes a southerly course, enters Arkansas, and joins the White river 40 miles below Batesville. During 9 months of the year it is navigable for a distance of 100 miles from its mouth. Its entire length is about 400 miles. Trout and other excellent fish are caught in its waters in great abundance.

**BLACK ROD**, the usher to the order of the garter, so called from the black rod which he carries at the feast of St. George, when the order annually assembles. He also notifies the election of new knights, carries the garter to foreign princes and others, and is the principal officer of the college of arms, and chief of the heralds.

**BLACK SEA** (anc. *Pontus Euxinus*), an inland sea, on the border between Asia and Europe, bounded by Turkey, Russia in Europe, and the Caucasian provinces, and connected with the Mediterranean through the straits of

the Bosphorus and Dardanelles. It lies between 28° and 41° 30' E. long., and 41° and 46° 40' N. lat. Its extreme length is 700 miles from E. to W., its extreme breadth 400 miles on the 81st meridian. It has a coast line of more than 2,000 miles, and a superficial area of about 180,000 sq. m. It receives the waters of the Danube, Dnieper, Dniester, and Don, beside smaller rivers, and drains by these a territory in Europe and Asia of scarcely less than 1,000,000 sq. m. There are geological indications that the Black sea was at one time much larger than it is now; that it once had no outlet to the Mediterranean; that its waters were much higher than at present, flooding a considerable part of southern Russia, and reaching even to the Caspian and Aral seas, with which it formed one body; and that at a period not far antecedent to the earliest history, some concussion of nature opened for this huge collection of water a passage into the Mediterranean. Something like this was the universal belief of the ancients, more probably a tradition than a fancy. Thus the Cyaneæ, the 2 volcanic rocks at the entrance of the Bosphorus, which, under the name of Symplegades, were represented by the Greek poets as sometimes closing together, indicate by their geological structure that they were once united, and must have closed the passage. And the southern provinces of Russia bear evident marks of having once been a bed of the sea, and of having been laid bare at a comparatively recent period. The modern name of Black, which all the European languages conspire to fix upon this sea, is thought to have been given it primarily by the Turks, in their terror at looking out upon the first large expanse of water with which they became acquainted. Natural features probably assisted in suggesting the name. The prevalent wind is from the N. E.; it comes laden with moisture from a wide swampy territory, and frequently veils the sea in darkness by fogs and rains. Owing, too, to the confined extent of the water, a strong wind quickly lashes it into a tempest, and gives to the whole sea something of the appearance of a whirlpool. These brief but troublesome tempests are especially frequent during the winter. Thunderstorms are rare, but masterpieces of their kind when they do occur, and are often accompanied by water-spouts and hailstones. The difficulties which the atmosphere offers to the navigation of the Black sea are compensated by the character of the sea itself. Both its shores and its interior parts are remarkably free from rocks, sandbanks, or shallows, and ships may always lie to, or ride at anchor, with very little danger. There is but one island in the whole sea, Serpent Isle, 30 miles from the mouth of the Danube, once a sacred place, with a temple, but unoccupied for centuries, till lately it was made a station for English and French vessels. It is now purposed to build a light-house upon it. The depth of the sea increases regularly according to the distance from the shore; and in its central parts, no bottom is reached even by a

line of 160 fathoms. There is no observable ebb and flow to its waters, but its large accessions from the rivers occasion strong currents, which all set, with more or less directness, toward the Bosphorus. When these currents are also helped by the winds, the waters are sent through the straits with such violence, that vessels are sometimes detained for months outside, unable to enter against them. Its climate has wide extremes, but is generally colder than would be inferred from its latitude, owing to the prevalence of north winds. Its fisheries are unimportant. The specific gravity of its water is 1.142. On its coast, Odessa is the most important commercial port, and Varna is the chief Turkish fortress; beside which, the principal harbors are Kherson, Sebastopol, Sinope, and Trebizond.—The shores of the Black sea are known both in fabulous and genuine history. Colchis, the goal of the Argonautic expedition, was located on its east; the original Cimmerian darkness was upon its north; and on all its sides the Lydian, Persian, Byzantine, Turkish, and Russian powers have acted the events of their history. From the time of Constantine till the 15th century, it was the centre of the transplanted Roman world; and till the cape of Good Hope was discovered and sailed round, it was the passage-way of the Genoese and other European trade with the Indies. The Turks for a time excluded the ships of all other nations from it, and lately Russia sought to make it a closed sea under its own military command; but the result of the late war between Russia and the 2 western powers of Europe has been the neutralization of the Black sea, the equal exclusion from it of all ships of war belonging to whatever nation, and the equal admission to it of all ships of commerce.

**BLACK SILVER**, called also **BRITTLE SILVER ORE** and **STREPHANTITE**, a compound of sulphuret of silver and sulphuret of antimony, found near the cobalt and bismuth mines of Saxony.

**BLACK SNAKE** (*Coluber constrictor*, Linn.), one of the most common snakes, very generally distributed over North America. The head is oval and long; the snout prolonged and rather pointed; the nostrils are lateral, very large near the snout, and open outward and a little backward; the eyes are large and bright, the pupil black, and the iris very dark gray; the body is long and slender, and covered with large smooth scales above, and with broad plates below; the tail is also long and slender, and, according to Holbrook, may be used as a prehensile instrument; according to Dr. Storer, the abdominal plates are 184, and the caudal scales 85. The color above is a dark bluish black; below, slate-colored; chin and throat pure white, with occasionally a few black spots; the margin of the jaws and snout yellow. The usual length is from 4 to 5 feet, of which the head is 1½ inch, and the tail about 16; one was killed at Hingham, Mass., in 1842, 7 feet long, which had enfolded and severely crushed in its coil a rabbit, and which had in its body 15

quail's eggs, unbroken, and some of them containing the young bird. It is very active, being from its rapid motions frequently called "the racer;" it climbs trees with great facility, and is often found entwined around bushes containing birds' nests. It frequents shady and shrubby places near ponds and streams, though it is very fond of basking in the sun. It feeds on mice, moles, frogs, toads, lizards, eggs, and young birds; the larger specimens prey upon squirrels, chickens, and even young rabbits; it is very destructive to young birds, and a noted robber of nests. Its specific name indicates that it possesses the power of destroying its prey by the constriction of its folds; its power in this respect is known to many a schoolboy, around whose leg or arm it has coiled, when the human robber of birds' nests has come into contact with the serpent thief similarly inclined. The one killed at Hingham had a rabbit in its coils; but it doubtless seizes its smaller and ordinary prey with its mouth only. It is very daring, and, during the breeding season, will often attack persons passing at a distance; its bite is perfectly harmless. There is no good evidence that it has any power of "fascination," its victims being taken by activity and direct assault.

**BLACK TIN**, tin ore that has been concentrated by stamping and washing, and brought into the condition to be sold to the smelters.

**BLACK VOMIT**, the last vomiting, in many cases of yellow fever, of a dark mucous-looking fluid, like coffee-grounds. It is regarded as a fatal symptom. The disease itself is sometimes called by this name. The blood is blackened and partially coagulated by a free acid, perhaps acetic and hydrochloric acids, which form in the system.

**BLACK WALNUT**. See **WALNUT**.

**BLACK WARRIOR**, a river of Alabama, formed by the junction of the Mulberry fork and Locust fork, in Walker county. It follows a south-westerly course, and enters the Tombigbee above Demopolis. The river is navigable for steamboats for 150 miles, or nearly its whole length. Coal and iron are found along its banks. It is sometimes called the Tuscaloosa.

**BLACKALL**, *OFFSPRING*, an English prelate, was born at London in 1654, died at Exeter in 1716. For 2 years after the coronation of William III. he refused to take the oath of allegiance, but finally yielded. In 1699 he engaged in a controversy with Toland, who had denied, in his life of Milton, that Charles I. was the author of the "Icon Basilike," and expressed doubts of the genuineness of the Scriptures. Blackall was consecrated bishop of Exeter in 1707. His works, in 2 vols. folio, were published in 1728.

**BLACKBERRY**, the berry of the bramble, a popular name applied to different varieties of the genus *rubus* and their fruit. Blackberry root is an excellent astringent, much employed in chronic diarrhoea and in dysentery. Dewberry root (*R. trivialis*) and blackberry root (*R. villosus*) have the same medicinal properties. They occur in pieces of various lengths,

of a brownish color, being covered with a thin bark, which abounds most in the astringent principle, tannic acid. The decoction is made by boiling an ounce of the smaller roots in 3 half pints of water down to 2; the dose being 2 fluid ounces, or  $\frac{1}{4}$ th portion of a pint.

**BLACKBIRD** (*turdus merula*, Linn.), a European species of the thrush family, called also merle in France and some parts of England. The plumage is full, soft, and glossy; the length in the male is 10 $\frac{1}{2}$  inches, and the extent of wings 16 inches, the length in the female is 10 inches, and the extent of wings 15 inches. In the adult male the bill is  $\frac{1}{4}$ ths of an inch long, and of a bright orange color, as are the mouth, tongue, and margins of the lids, the iris hazel, the feet and claws dusky brown, the heel and soles yellow; the general color of the plumage is deep black, sometimes slightly tinged with brown; the primaries are lighter, and obscurely edged with brown; the central part of the hidden portion of each feather is light gray. In the female, the bill is dark brown; the general color of the plumage is deep brown above, lighter beneath; the throat and fore neck pale brown, streaked with darker triangular spots. The young are dusky brown above, with dull yellowish streaks; pale yellowish brown, spotted with dusky, beneath. Albino specimens are occasionally seen. The blackbird is an admirable singer, its notes, though simple, being loud, rich, and mellow, most frequently heard in the morning and evening. It prefers cultivated districts, in winter frequenting the neighborhood of houses, and keeping in the shelter of the garden hedges. Its food consists of snails, seeds of grasses and grain, insects, larvæ, worms, berries of various kinds, and also fruits. It is a very shy and active bird, hopping on the ground with tail raised and wings loose; its flight along the hedges is fitful and wavering, but in an open field very steady and sustained. It is not gregarious, more than 3 or 4 being seldom seen together. The blackbird pairs in early spring, making a nest externally of grass stalks, twigs, fibrous roots, and mosses, the inside being lined with mud and afterward with dry grass; the nest is usually placed in a hedge, bramble thicket, or bushy pine. The eggs are from 4 to 6 in number, of a pale bluish green, spotted with pale umber. The female sits 18 days, the male singing till the young are hatched; 2 broods are commonly reared, one in May, the second in July. The flesh is excellent for food. The blackbird is often kept in cages, where its song is as joyous as in its native haunts; it is a troublesome species in an aviary, as it pursues and harasses other birds; in confinement it will eat crumbs, and raw or cooked flesh.—**BLACKBIRD** (*agelaius phoeniceus*, Linn.), more commonly called in New England red-winged blackbird, and belonging to the family of *sturnida*. The bill is straight, strong, conical, and black; the hind toe and claw the strongest. The plumage of the adult male is glossy black, except the smaller wing coverts, the first row

of which are cream-colored, the rest scarlet; the length is 9 inches, extent of wings 14 inches. The female is nearly 2 inches less; the upper parts black, the feathers with a pale brown margin, underneath streaked with black and dull white; a band of pale brown over the eye, and some of the smaller wing coverts slightly tinged with red. According to Nuttall, this bird is found during the summer over the whole of North America from Nova Scotia to Mexico. It arrives in New York and New England about the 1st of April, preferring swamps, meadows, and low situations; at this season it lives on insects and grubs, afterward on the young and tender corn. It begins to build its nest early in May, on an alder bush or tuft of grass in some marsh or meadow; the eggs, from 3 to 6, are white, tinged with blue, with faint purple marks. They congregate in such numbers in a very small space, that great havoc may be made at a single discharge of a gun. The flight is usually even; on the wing the brilliant scarlet of the coverts contrasts finely with the black of the general plumage. Some of its notes are agreeable to the ear. In August, when the young are ready to associate in flocks, they do considerable mischief to the Indian corn; they are then killed in abundance, and are very good eating. Such is their confidence in man, in spite of his persecutions, that, when fired upon, they only remove from one part of a field to another.—The name blackbird is given in the north-western states and Canada to the rusty grackle (*sceloporphagus ferrugineus*, Wils.), and in other parts of the country to the purple grackle (*quiscahis versicolor*, Vieill.); both genera belong to the family *sturnida*, or starlings.

BLACKBURN, a town, parish, and parliamentary borough of England, county of Lancaster. It stands in the midst of a barren district, containing a number of valuable coal mines, to which, as well as to its proximity to the London and Liverpool canal, the importance of Blackburn as a commercial place is mainly to be ascribed. Cotton goods, especially of the coarser kinds, are manufactured to a great extent in the town and vicinity; the annual value of the fabrics produced is estimated at above £2,000,000. Blackburn is irregularly built, but contains some fine buildings. In addition to a number of chapels, schools, public halls, &c., it has a magnificent church, rebuilt in 1819 at a cost of £28,000. It is the birthplace of James Hargreaves, the inventor of the spinning-jenny. Pop. of the borough in 1861, 46,586.

BLACKBURN, FRANCIS, an English theologian, born at Richmond, Yorkshire, June 9, 1705, died there Aug. 7, 1787. He graduated at Cambridge in 1726, and was presented to the rectory of his native town, and in 1750, became archdeacon of Cleveland and prebendary of Bilton. He wrote several polemical works, among which the "Confessional" appeared in 1766. It was greatly objected to by many orthodox clergymen; indeed, so heterodox was he soon considered that on the death of Dr. Chan-

dlar, pastor of the dissenting chapel in the Old Jewry, London, the congregation actually invited Archdeacon Blackburne to fill the vacancy, believing that he would not object to leave the church of England. When the Catholic question was mooted, in 1768, he published a work contending that Roman Catholics were persecutors where they had the power, and therefore were entitled to no toleration from Protestants.

BLACKCAP (*sylosia atricapilla*, Briss.), belonging to the family of *lucanida*, or warblers, a native of Europe, migrating to the north in early spring. The male has the upper parts light yellowish gray, the head black, cheeks, neck, and lower parts ash-gray, paler behind and tinged with yellow; wings and tail grayish brown; the length to end of tail is about 6 inches, extent of wings 9 inches. The female is a trifle larger, but is colored like the male, except that the upper part of the head is light reddish brown. It frequents woods and thick hedges, gardens and orchards. With the exception of the nightingale, it is considered the finest songster in Great Britain; its notes are full, deep, and mellow, and its trill is exceedingly fine; it will imitate very exactly the notes of the nightingale, thrush, and blackbird. Its song is continued from early in April to the end of June, the period of pairing and incubation. This bird is shy, going by short flights from one thick bush to another; it feeds on insects, larvae, and berries. The nest, which is placed in the fork of some shrub, is made of dried stalks of grass, bits of wool, moss, fibrous roots, and hairs; the eggs are 4 or 5 in number, about  $\frac{1}{2}$  of an inch long, and very nearly as broad, grayish white, faintly stained and freckled with purplish gray and blackish brown. Both sexes sit upon the eggs.—BLACKCAP (*parus atricapillus*, Wils.), an American species of titmouse, belonging also to the *lucanida*. This bird is  $5\frac{1}{4}$  inches long, and 8 in extent of wings. The bill is brownish black; whole upper part of the head and hind neck, and a large patch on the fore neck and throat, pure black; between these a white band, from the bill down the sides of the neck, growing broader behind and encroaching on the back, which, with the wing coverts, is ash-gray tinged with brown; lower parts brownish white; quills brown, and, with the secondaries, edged with white, leaving a conspicuous white bar on the wings; tail brown, white edged. The Carolina tit (*parus carolinensis*, Aud.) is almost precisely the same, being only an inch smaller. The blackcap is better known in New England as the chickadee, which is an imitation of its note as it explores the trees in search of the eggs and grubs of insects, which form its principal food. It destroys immense numbers of canker-worms, doing in this way eminent service to man; in the winter it comes near the houses, picking up seeds and crumbs which are thrown out of doors. It is an exceedingly lively bird, running over trees in all directions,

and thrusting its bill into every crevice where an insect might creep. The severest cold does not affect its vivacity nor the numbers. The eggs are 6 to 10 in number, of a white color, with brownish-red specks, and are generally laid in holes excavated in trees by means of their bills.

**BLACKCOCK**, or **BLACK GROUSE** (*tetrao tetrix*, Linn.), a highly prized game-bird, of the family *tetraonida*, very generally spread over the northern parts of Europe, and in Great Britain, particularly in the wild and wooded districts of Scotland. The male weighs sometimes as much as 4 pounds, and the female about 2. In the male, the length to the end of the tail is about 28 inches, and the extent of wings 38 inches; bill an inch long, strong, and brownish black; the iris brown; over the eye a bare granulated skin of a scarlet color; the whole upper plumage of a steel-blue color, the scapulars and wings tinged with brown; the primaries brown, with brownish white shafts, the secondaries tipped with whitish, forming a bar across the wings, conspicuous in flight; the under wing coverts white, a few of them being visible when the wing is closed; the breast and sides brownish black, the abdominal feathers tipped with white; the legs and thighs dark brown, with grayish-white specks, the former feathered to the toes; the lower tail coverts white, the upper brownish black; the tail, which is forked, with the lateral feathers curved outward, deep black. The female is about 18 inches long, and 31 inches in extent of wings; she resembles the other females of the family in her less brilliant markings; the general color of the plumage is ferruginous, mottled and barred with black above, and with dusky and brown bars on a paler ground below; the tail is nearly even at the end, straight, and variegated with ferruginous and black; the white about the secondaries and bend of the wing is much as in the male. The favorite abode of the blackcock is in the highlands and glens, among the hills clothed with a luxuriant growth of birch, hazel, willow, and alder, with an undergrowth of deep fern; here they find abundant food and shelter from the winter's cold and summer's sun. Their food consists of tender twigs, berries, heaths, and occasionally the seeds from the stubble-fields. The flight is heavy, straight, of moderate velocity, and capable of being protracted. They perch readily on trees, but the ordinary station is the ground, on which they repose at night. The blackcocks are polygamous, and fight desperately for the females during April; having driven off all rivals, the male selects some eminence early in the morning, on which he struts, trailing his wings, swelling out his plumage and wattles over the eyes like a turkey-cock; the females answer to his call and soon crowd around him. After the courting season the males associate together peaceably. The eggs are 6 to 10 in number, of a dirty white color, with rusty

spots, and are laid in a very rude nest on the ground, among the heaths; the young are reared entirely by the female, which they resemble in color. Their flesh is an excellent and important article of food. Foxes and rapacious birds kill great numbers of them.

**BLACKFISH**, a name given in New England to two entirely different kinds of fish; the one a smaller kind of whale, 15 to 20 feet in length; and the other, the tautog (*T. Americana*, Dekay), caught with hook and line on rocky bottoms. It abounds on the coast of New England, on both sides of Long Island, and off Sandy Hook, New Jersey. The name blackfish is given to it on account of the color of its back and sides; the lips, lower jaw, and belly, in the males particularly, are white. The tail is entire, somewhat convex, the middle rays being somewhat longer than the external ones. The body is covered with small, hard scales. They vary in size from 2 to 12 or 14 pounds. They are caught early in the spring, and through the summer, from off the rocky ledges of the coast, or from boats anchored over the reefs. The fishing for them is a favorite sport in the warm summer weather, and the fish, though of dry flavor, are much esteemed when baked.

**BLACKFORD**, a county in the E. N. E. part of Indiana, drained by the Salamonie river, and having an area of 180 sq. m. The surface is diversified by plains and rolling lands, and the soil is fertile. The productions in 1850 amounted to 67,060 bushels of corn, 18,262 of wheat, 9,384 of oats, and 1,254 tons of hay. There were 5 churches in the county, and 20 pupils attending public schools. Pop. 2,860; capital, Hartford.

**BLACKFRIARS**, a name given to the Dominican order of mendicant monks in England, from the color of their garments. Thirteen Dominicans first came into England, A. D. 1221, and fixed their first house at Oxford in that year. The Blackfriars' at London was their second house, whence the parochial district still bears the name of the order. At the time of the dissolution of monasteries in England and Wales, there were 58 houses of this order.

**BLACKFRIARS' BRIDGE**, one of the 7 bridges over the Thames in London, and 8d in point of date. A monastery of Dominicans formerly existed near its site. The north end is situated in the city of London, the south in the borough of Southwark. It consists of 9 elliptical arches, of which the central arch is 100, and the side arches 70 feet span. The whole length is 1,085 feet. The breadth of the carriage-way is 28 feet, and the foot-ways 7 feet each. The greatest height of the bridge, from the caissons in which the piers are laid to the top of the balustrades, is about 70 feet. The roadway was very steep, being in some places as much as 1 in 16. The designer and builder was Robert Mylne. The first stone was laid Oct. 31, 1760, and was finished in 1770. The bridge was built by the corporation of the city of London, who raised almost the whole of the money by public

subscription. The total cost of the work was nearly £300,000. At first the city levied toll upon it, but, about 1770, the government bought up all the shares, and made a present of the bridge to the public, free of toll, as it has ever since remained. It is constructed of Portland stone. In consequence of its decay, it was repaired in 1833 and following years, and the approaches made less steep. The success of Blackfriars' bridge demonstrated the equal adaptiveness of the elliptical arch with the semicircular—a fact which was previously doubted.

BLACKGUARD, originally a semi-contemptuous, semi-jocular name given to the lowest menials of the court of Queen Elizabeth, the carriers of coals and wood, turnspits and laborers in the scullery, who all followed the court in its progresses. In Hodge's "Illustrations" we read: "Her majesty, by some means I know not, was lodged at his house, Euston, farre unmeet for her highness, but fitter for the *blacke garde*." The term *blacke garde* was applied in Ireland in those times to all abandoned women of violent character, and also both in Ireland and England to low ruffians.

BLACKHEATH, an elevated heath in the county of Kent. It borders on Greenwich park, and is about  $1\frac{1}{2}$  mile long by  $\frac{1}{4}$  wide, about 5 miles from St. Paul's, London. It is a place of popular resort, and is used for cricket-playing. Adjoining the heath, on the east, is Morden college, founded in 1695, by Sir John Morden, for the support of 40 decayed merchants above 50 years old. Each of the pensioners receives £5 per month, and has an apartment, with medicine, coals, candles, washing, and attendance free. The Roman road from London to Dover crossed Blackheath. Many Roman, Celtic, and Saxon antiquities have been found there. In 1381 Wat Tyler and John Ball mustered their followers there. Jack Cade occupied the same position twice in 1450. In 1497 the Cornish insurgents, under Lord Audley, were routed there by the king's forces. Blackheath has been the scene of many historical pageants and processions, as it was formerly the custom for the mayor and corporation of the city of London, and even the king and court, to repair thither to meet illustrious foreigners from the continent. Henry IV. met there (1400) the Byzantine emperor, Michael Palæologus; the corporation of London there met Henry V., on his return from Agincourt, and the year afterward, the Emperor Sigismund. The most splendid, and one of the last of all, was the reception of Anne of Cleves, by Henry VIII., Jan. 1541; she was conducted through Greenwich park to the palace at Greenwich, followed by prodigious numbers of nobility and gentry, and 1,200 privileged citizens, clad in velvet and chains of gold.

BLACKING, a preparation applied to leather, designed either to preserve or to polish it. There are a great variety of recipes for its manufacture, all of which are empirical, and some in-

troduce ingredients which must be decidedly injurious to the leather. Ivory black, vinegar or sour beer, sugar or molasses, and a little sweet oil and sulphuric acid, are the common ingredients. The corrosive properties of the acids are neutralized by the lime in the ivory black, and the new combination thus produced is well adapted to the purposes desired. It is made in the form of a paste, and also liquid. The following recipe (patented in England) is designed to give the leather somewhat of a waterproof quality by the caoutchouc, one of its ingredients: 18 oz. of this substance are to be dissolved in 9 lbs. of hot rape oil; to this add 60 lbs. ivory black, and 45 lbs. molasses, with 1 lb. finely ground gum arabic, previously dissolved in 20 gallons of vinegar, of strength No. 24; the whole to be well triturated in a paint-mill till smooth. Then add, in small successive quantities, 12 lbs. sulphuric acid, stirring strongly for half an hour. The stirring is to be continued for half an hour a day during a fortnight, when 8 lbs. of gum arabic, in fine powder, are to be added, and the half hour's daily stirring continued another fortnight, when it is ready for use. For paste blacking the same ingredients and quantities are used, except that instead of 20 gallons of vinegar, 12 gallons will answer, and a week of stirring only is required. A good blacking is also made more simply by mixing 8 oz. of ivory black, two of molasses, a table-spoonful of sweet oil, 1 oz. of sulphuric acid, 1 of gum arabic, dissolved in water and a pint of vinegar. —An excellent blacking for harness is prepared by melting 2 oz. of mutton suet with 6 oz. of beeswax, to which are to be added 6 oz. of sugar candy, 2 oz. of soft soap dissolved in water, and 1 oz. of indigo finely powdered, and, when melted and well mixed, a gill of turpentine. It is to be put on with a sponge and polished with a brush. —Blacking for stoves may be made of finely powdered black lead, of which  $\frac{1}{4}$  lb. may be mixed with the whites of 8 eggs well beaten. The mixture is then to be diluted with sour beer or porter, well stirred, and heated to simmering for about half an hour.

BLACKLOCK, THOMAS, D. D., a clergyman of the established church of Scotland, born at Annan, Nov. 10, 1721, died July 7, 1791. He became blind at the age of 6 months. His father, who was a mechanic, used to read to him from the best English authors. The habit of mental concentration, induced by his loss of sight, was of great advantage to him. He early acquired a knowledge of Latin. At 12 he produced creditable verses. At 20 he was introduced into a circle of more highly educated associates. Dr. Stevenson, of Edinburgh, now offered him an education at the university, and in 1741 he commenced his course of studies, but the rebellion in 1745 interrupted them. He afterward returned to Edinburgh, and remained there 6 years more, becoming proficient in the classics and in music. A quarto edition of his poems was published in 1756, in London, by

subscription, when David Hume exerted himself to promote its circulation. Two octavo editions had been previously issued in 1746 and 1754. In 1759 he was licensed as a minister of the gospel. In 1762 he married, and was ordained minister of Kirkcudbright. In 1764 he resigned, and retired to Edinburgh on a small pension. He also instructed a few young men.

**BLACKLOW HILL**, an eminence near the town of Warwick, Warwickshire, England, upon which is a stone cross, marking the spot where Piers Gaveston, the favorite of Edward II., was beheaded by the barons in 1312.

**BLACKMORE**, **SIR RICHARD**, an English poet, born in 1650, died Oct. 9, 1729. He was the author of 6 epic poems, which owe their principal celebrity to the *Dunciad*. He was also physician to William III.

**BLACKSTONE**, **WILLIAM**, the first inhabitant of Boston, was an Episcopal minister, who settled there as early as 1625 or 1626, and died May 26, 1675, on Blackstone river, a few miles north of Providence. On the arrival of Gov. Winthrop at Charlestown, in the summer of 1630, it is stated in the records of that place that "Mr. Blackstone, dwelling on the other side of Charles river, alone, at a place by the Indians called Shawmut, where he only had a cottage, at or not far off from the place, called Blackstone's point, he came and acquainted the governor of an excellent spring there, withal inviting him and soliciting him thither; whereupon, after the death of Mr. Johnson and divers others, the governor, with Mr. Wilson, and the greatest part of the church, removed thither." At a court held in April, 1633, 50 acres of land near his house in Boston were granted to him forever.

**BLACKSTONE**, **SIR WILLIAM**, LL. D., an eminent English jurist, born in London, July 10, 1723, died Feb. 14, 1780. He was the son of a silk-mercer of London, the youngest of 4 children, and was born a few months after his father's death. His father seems to have left no provision for the education of his children, and the future judge was indebted to a maternal uncle for his education. In his 7th year he was placed at the school of the Charter-house, and in his devotion to his studies exhibited, at that early age, the constant assiduity for which he was distinguished through life. In his 12th year he lost his mother, and, being an orphan, was admitted, in 1735, on the nomination of Sir Robert Walpole, upon the foundation of the charter-house. His natural aptness and persevering attention to his studies made him the favorite pupil of the school. When he had attained his 15th year he was at the head of it, and his progress was so rapid that at 16 he was found fully qualified for the university. He accordingly entered Pembroke college, Oxford, Nov. 30, 1738, and had scarcely more than commenced his collegiate course, when he distinguished himself by carrying off the gold prize medal for some verses upon Milton, beside receiving other marks of distinction from the society of Pem-

broke college, and from the governors of his former school. In college he pursued his studies with unremitting ardor, making himself extensively acquainted with the Greek and Latin poets, and giving his attention especially to the study of logic, the mathematics, and to several of the sciences. At 20 he compiled, for his own use, a treatise upon architecture, a branch of the arts of which he was particularly fond. He also exhibited a talent for poetry, of which some favorable specimens were the fruits of his leisure hours. Upon completing his collegiate course, he was entered at the Middle Temple, Nov. 30, 1741, and giving himself up to the exacting study demanded in this profession, he bade adieu to the poetical pursuits so congenial to his mind in a copy of verses entitled "The Lawyer's Farewell to his Muse," which still holds its place in English literature. In 1743 he was elected a fellow of All Souls' college, and from this period continued to divide his time between the university and his chambers in the Temple, until he was admitted to the bar in 1745. Having no influential connection, and failing to acquire the art of speaking extemporaneously with ease and facility, he attracted but little notice; and after spending 7 years without obtaining sufficient employment even for the support of a man of his moderate views and inexpensive habits, he resolved to abandon his profession, to fall back upon his fellowship and devote the remainder of his life to academic pursuits. But this period of weary waiting was not unproductive of results. Upon his return to Oxford he had already conceived the plan of the celebrated work, which in a popular sense has made his name almost a synonyme for law; and one of his first undertakings, upon going back to the university, was the reading of a series of lectures upon the laws of England, which at once attracted a crowded class of young men, among whom was Jeremy Bentham, then a lad of 16, afterward destined to become one of the most formidable opponents not only of the system of Blackstone, but of the whole structure of English law, and the most subtle and sarcastic critic of the work that Blackstone has left to posterity. But the active mind of the future commentator was not confined to his lectures upon law. He wrote treatises upon different subjects connected with the government and administration of the university; established an exact and methodical system of accounts; restored the muniments of the colleges from a state of confusion to systematic order; applied his architectural taste and knowledge to the rectifying of mistakes in buildings; partially finished and superintended the erection of others, especially the Codrington library, the books of which he classified and arranged; took upon himself the superintendence of the press of the university; and that he might correct abuses and effect a thorough reform in its management, went so far even as to make himself master of the mechanical art of print-

ing; in addition to which he secured, by his legal knowledge and active exertions, several important bequests which had been left to the college. In 1749 he was elected recorder of Wallingford, an old borough town between London and Oxford, the duties of which he continued to discharge for the space of 20 years. In his periodical visits to this town he did not limit himself merely to his judicial duties, but found time to render most important service to the place. To these manifold labors were added the stewardship of All Souls' college, and the office of assessor of the vice-chancellor's court, which he filled for 6 years, and the publication of an analysis of the laws of England as a guide to his lectures, and tracts upon antiquarian, legal, political, and historical subjects. In 1750 he was created a doctor of the civil law. Mr. Viner, author of the "Abridgment of the Common Law," having bequeathed the profits of this voluminous work, together with a large sum of money, for the establishment of a professorship of the common law at Oxford, this bequest was carried into effect in 1758, and Blackstone was unanimously elected the first professor. He now set to work to execute what he had long meditated, a course of lectures, which should embrace a complete survey of the laws and political constitution of England; and in five days after his appointment he prepared and delivered the opening lecture, constituting the celebrated introduction to his "Commentaries," a production which has ever since been esteemed one of the most easy, flowing, and graceful compositions upon a subject in itself unattractive, to be found in the English tongue. This course drew together a great concourse of students, the fame of the lectures spread over England, and copies of them were transmitted to the prince of Wales, afterward George III., then pursuing his education, for his perusal and instruction. The extensive reputation he had now acquired emboldened him to make another attempt to establish himself in the practice of the law in London, which he did with the most complete success. His great capacity for the management of business, his extensive learning and his unwearied industry, were universally recognized, and he rose almost at once to eminence. In little more than a year he was offered, but declined, the chief justiceship of the common pleas in Ireland, and had scarcely more than refused this office, when he was raised to the high rank of king's counsel, and had the honor conferred upon him of a seat in parliament, by a town in Wiltshire, the county of his ancestors. He was now in his 38th year, and his worldly prospects warranting the step, he married a lady of good family, by whom he had 9 children, and was enabled to purchase a villa at Wallingford, to which he retired annually when released from his labors in London and in Oxford. For 7 years he continued the delivery of his lectures at Oxford, the remainder of his time being given to his

business in the law courts in London, to his duties in parliament, to his recordership at Wallingford, and other minor posts, the duties of which he still continued to discharge. During this time he collected and published his various tracts upon legal subjects in 2 volumes, and in 1763 he was appointed solicitor-general to the queen. When he accepted the Vinerian professorship at Oxford, he had formed the design of establishing in one of the halls or separate buildings a regularly organized college of the common law, which was in his opinion the object of Mr. Viner, and of settling himself in that seat of learning for life. But the authorities of the university rejected the plan, and Blackstone, feeling that he could not discharge the duties of the professorship properly, unless it was placed upon a footing that would enable him to give his time exclusively to it, and abandoning all hope of being able to carry out the intention of Mr. Viner, resigned, to the great regret of all who had looked forward to the establishment in Oxford of a school where the law would be taught theoretically as in foreign universities.—In the year preceding his resignation, Blackstone, having found that imperfect copies of his lectures had got abroad, and that an edition of them was about to be printed in Dublin, resolved to publish them himself, under the title of "Commentaries on the Laws of England." He accordingly commenced the publication of them in 1765, and continued it until 1769, when the work was completed in 4 vols. 8vo. Its publication was followed by a degree of laudation bordering upon extravagance. Sir William Jones, who was not only a great scholar, but a great lawyer, thought it the most correct and beautiful outline that had ever appeared of any human science; and others, among whom was Chitty, declared it to be the most valuable work that had ever been produced by the labor of a single man. These opinions, however, were not universal. Priestley attacked it with great vigor and severity for the exposition it gave of the nature of the offences against the church of England, and Bentham, who subjected it to a close legal criticism, could find nothing in it to admire but the "enchanted harmony" of its style. Both of these writers detected grave errors, which were corrected in a subsequent edition. As respects the value of this celebrated work, we are, at the present day, better enabled to form a just judgment, as it has been subjected to the test of all tests, time. So far as it treats of the principles of law in general, it is not to be compared with the great work of Montesquieu, and as an exposition of the nature or principles of the English constitution, it is greatly inferior to the work of De Lolme, who was a foreigner; but as a general treatise upon the laws of England, it must be regarded, especially when it is viewed with respect to the time at which it was written, as a production of uncommon merit. With the exception of the work of

Bracton, who wrote in the reign of Henry III., there was no treatise professing to present, as a whole, the system of English jurisprudence. The "Institutes" of Lord Coke consisted mainly of a running commentary upon a small treatise by Littleton, and though a most accurate and learned work, it was limited in its scope, and so unmethodically arranged, that none but a disciplined lawyer could comprehend it. The treatise of Sir Matthew Hale embraces merely the criminal law, and the bulk of the rules and principles, which constitute the English system, were to be collected only from an immense mass of statutes, reports, digests, abridgments, old charters, and ancient treatises. To weave out of this mass of incongruous material an orderly, well-arranged, and luminous exposition of a system of jurisprudence, the result of 8 centuries of legislation and judicial decision, was an undertaking that no one before Blackstone had been able to accomplish. To condense such a vast subject within the limits of 4 moderate-sized volumes, and present it in a style so popular and easy of comprehension, that all classes could read and understand it, was no ordinary achievement. He very justly said that he was unassisted in his extensive and arduous task by preceding examples, and acknowledged that what he had accomplished fell far short of his own ideas of perfection. The chief objection to the work is its over-estimation of every thing to be found in the English law, for if Blackstone was quick to perceive the merits that lie in the English system, he was equally blind to its defects, and this undistinguishing admiration constantly led him to suggest reasons for artificial and arbitrary rules that had nothing but precedent to support them—reasons frequently more absurd than the rules themselves. But these defects are alight when weighed against the work as a whole. The best evidence of its merits is that no writer has been able to supplant it, that it has passed through innumerable editions, that it has had no less than 10 different editors, many of them among the most distinguished and learned of legal writers, who have enriched it with valuable notes, and that at this day, nearly a century after its publication, it is still the first book which is placed in the hands of the student to give him a comprehensive knowledge of the nature of the science he is about to learn, and that it is to be found as an indispensable textbook in the library of every lawyer in this country and in England. The low estimate formed of it by Bentham is not that of the majority of legal critics and foreign jurists, who rank it with the great work of Domat. Of the wonderful care displayed in the treatment of a subject demanding on the part of a writer the greatest condensation and clearness, there is but one opinion. Chancellor Kent, after an exposition in his "Commentaries" of one of the most intricate and difficult parts of the law of real property, is so little satisfied with his own performance, that he advises his reader to peruse

Blackstone's chapter upon the same subject, with the remark that he had read it many times, but never without mingled feelings of delight and despair.—In parliament Blackstone was a uniform supporter of the government. He participated occasionally in the discussions, but exhibited no talent as a speaker or debater. Upon one occasion, when he undertook to satisfy the house that, by the laws of England, Wilkes as an expelled member was ineligible to reelection, Granville completely discomfited him by citing a passage from his own book. The passage was not incapable of explanation, but, according to Junius, Blackstone looked thunderstruck, and was unable to make any reply. Sir William Meredith attacked him in a pamphlet for his inconsistency, which he answered by another, when Junius assailed him, and he became involved in a discussion with that writer. But, as in his controversy with Priestley, he exhibited no skill in this kind of warfare. In both cases his defence was calm, dignified, and plausible, but it availed little before the vehement rhetoric of Priestley, or the stinging sarcasms of Junius. The assault of Junius commended him but the more strongly to the government, and when Mr. Dunning resigned in 1770 he was tendered the office of solicitor-general; but feeling himself deficient in the forensic qualities demanded by this office, he declined it. In a month after, a judgeship becoming vacant in the court of common pleas, the place was offered to him, and was accepted. At the request of Justice Yates, who wished to leave the court of king's bench, he, with the assent of the government, exchanged for the king's bench; but upon the death of Justice Yates, a few months after, he was again made judge of the common pleas, and continued in that office for the remainder of his life. Assiduous and attentive to his judicial duties, he still found leisure for other employments, and gave much of his time to the subject of prisons, earnestly advocating the modern penitentiary system as a substitute for transportation. When he had passed his 50th year, the severe midnight studies of his youth, and the arduous sedentary labor of his manhood, began to tell upon his constitution. He was affected by a nervous disease, and was subject to occasional attacks of gout, which increased as he grew corpulent, and were aggravated by the objection he always had to bodily exercise. For 10 years, however, he continued regularly to discharge the duties of his judgeship, interrupted by occasional fits of illness, but at the end of that time he began to exhibit symptoms of dropsy, and, coming up to London to attend the opening of the court, he was seized with a drowsiness and stupor that baffled all the arts of medicine. For several days he remained insensible, and expired at his house in London in the 57th year of his age.—Throughout the active and laborious life of this remarkable man, he was influenced by the ever-prevailing desire to make himself useful. With all his elegant attainments, ex-

quisite taste, and varied learning, he had a constant eye to utility, devoting himself chiefly to those pursuits which he considered the most serviceable in the ordinary affairs of men. Whether in his own matters, or in the discharge of public duties, he was exact and methodical, remarkable for his punctuality, his probity, and conscientiousness. As a judge he was honest and patient, though subject to a constitutional irritability which occasionally broke forth beyond his power of control. A heavy brow, which, being short-sighted, he was in the habit of contracting, gave his countenance, as we see it in his portrait by Gainsborough, an air of sternness; and a natural reserve proceeding from a diffidence that he never entirely got rid of, together with a ceremonious observance of what he thought essential to the gravity and dignity of the judicial station, gave outwardly the impression of pride; and many, from his occasional irritability, thought him ill-natured, but he was in fact a most amiable man, cheerful, agreeable, and even facetious, a kind father, an affectionate husband, and a very faithful friend. He managed his affairs with great prudence and economy, but was liberal within his means, and always benevolent. In religious matters he was earnest and sincere, without affectation, profoundly believing in the church of England, and conforming strictly to its rules and practices. As a public man, the tendency of his mind inclined him strongly to the support of existing institutions, but at the same time he was noted for his moderation, for his contempt for the motives that influence, and which are frequently the mainspring of, party contests, and for his generally tolerant spirit. Indeed, in his conduct in all public affairs, whether as a statesman, a judge, or as a prominent member of the church of England, he was far more tolerant than might be supposed from his writings. Before his death he communicated some valuable notes and emendations upon Shakespeare to Malone, which were made use of by Stevens, in his edition of the poet; and he left the materials for 2 volumes of reports, which were published by his executors for the benefit of his family, but as they consisted mainly of imperfect notes that required his supervision, they have added nothing to his reputation. Having a large family to bring up, he was not able, with all his care and economy, to leave much behind him; but George III., considering that he had rendered a great service to the nation by his "Commentaries," made a liberal and ample provision for his wife and children. At his own request his remains were interred in the church at Wallingford, which his architectural taste had embellished. A marble statue was erected to his memory at Oxford; his arms were directed to be emblazoned upon the windows of one of the principal halls, and his portrait was hung among the worthies of the college.

BLACKSTONE CANAL, laid out in 1828, from Worcester, Mass., to Providence, R. I., 48

miles, along the valley of the Blackstone river, with chartered privileges for the production and sale of water power. It was completed in 1829. Upon the introduction of railroads, it was superseded by one laid out along its general course, and only those portions of the canal remain which are used for water power.

BLACKSTONE RIVER rises in Paxton and Holden townships, Worcester co., Mass., and flows S. E. into the state of Rhode Island, where it is called the Pawtucket. It affords abundant water power, and for a great part of its course flows through an almost continuous village of manufacturing establishments. The scenery of the narrow valley is attractive. The soil is highly cultivated, and with the opportunities of both the canal and the river for the use of water, the meadows for many miles have been carefully graded for irrigation. The water is let into ditches, over the slopes of which it flows in a thin sheet, and is received in others, so as to be used several times over. It is usually let on after the crop of grass is removed, and is kept on about 8 days. By this means, 4 or 5 crops are obtained in a season.

BLACKWALL, ANTHONY, an English school-master and author, born in 1674, died at Market Bosworth in Leicestershire, April 8, 1780. In 1725 appeared his "Sacred Classics Defended and Illustrated," in 2 vols.

BLACKWELL, ALEXANDER, a native of Aberdeen, who practised medicine in London, set up a printing establishment, became a bankrupt in 1784, and was supported by the sale of a herbal, containing drawings and descriptions of the plants most useful in the practice of physic, prepared by his wife Elizabeth. In 1740 he went to Sweden, and was afterward tried upon a charge of conspiring against the royal family of Sweden, and beheaded Aug. 9, 1748.

BLACKWELL, ELIZABETH, the first woman who ever received the degree of M. D. in the United States, born at Bristol, England, in 1821. Her father removed to this country, with his family, in 1831, and settled in New York as a sugar refiner, but meeting with reverses in business, he emigrated in 1837 to Cincinnati, Ohio, where he died a few months afterward, leaving a widow and 9 children almost destitute. Elizabeth, then a girl of 17 years, opened a school, which she conducted successfully for several years. But her energetic temperament and strong desire for the acquisition of knowledge demanded a wider field; and long reflection having persuaded her that some avenue should be opened to women whom either necessity or choice impelled to gain a subsistence by their own exertions, she felt that her path of duty lay in that direction. A friend suggested to her the study of medicine as a profession for which she was peculiarly adapted, and one which woman could well fill. It so happened that the art of healing was one for which, up to that time, she had always felt a peculiar repugnance. The suggestion, however, after mature consideration, commended itself to her bet-

er judgment, and she consulted several friends in regard to it, and, among others, some physicians of eminence. She received on all hands only discouragement. But as the objections to such a plan of life were based rather upon the difficulties to be encountered than upon any inherent impropriety or unreasonableness in it, they only served to quicken her zeal and determination. She resolved to become a physician, and to return again to teaching to acquire the requisite means of education. A situation as governess was found in the family of Dr. John Dixon, of Asheville, N. C., where she remained a year, having access, during that time, to a medical library, and receiving from Dr. Dixon some direction as to her reading, but no encouragement in her purpose. At the end of the year she removed to Charleston, S. C., still acting as a teacher of music, but pursuing her studies with the aid and sympathy of Dr. S. H. Dixon, subsequently professor of the institute and practice of medicine in the university of New York.—Miss Blackwell next went to Philadelphia, and passed 6 months in study under Dr. Allen and Dr. Warrington, of that city. During that time she made formal application to the medical schools of Philadelphia, New York, and Boston, for admission as a student. In each instance the request was courteously but firmly denied, on the ground of a want of precedent for such an admission, and of the impropriety of such an innovation upon established custom. Several of the professors, however, avowed a sincere interest in her hopes and purposes, and some of them urged her to seek admission into one or another of the schools under the disguise of a feigned name and male attire. She declined to take into consideration any such suggestion, for, though anxious to obtain a medical education for herself, she was hardly less desirous of asserting her right to it as a woman. Undismayed by these difficulties, however, she next made application to 10 other medical schools in different parts of the country, which was rejected by all except those at Geneva, N. Y., and at Castleton, Vt. At Geneva, the faculty, after expressing their own acquiescence, laid the proposition before their students, leaving the decision with them. The young men unanimously assented to the reception of the new pupil, and pledged themselves that no conduct of theirs should ever cause her to regret the step she had taken. It is to their credit that they faithfully observed this pledge during the 2 subsequent collegiate years that she passed among them. Here Miss Blackwell took her degree of M. D., in regular course, in January, 1849. During her connection with the college, but when not in attendance there upon lectures, she pursued a course of clinical study in Blockley hospital, in Philadelphia. The spring after her graduation she went to Paris, and remained 6 months as a student in the *Maternité*, devoting herself to the study and practice of midwifery. The next autumn she was admitted, as a physician, to walk the hospital of St. Bar-

tholomew, in London, where she could not have been received as a student. After nearly a year spent in St. Bartholomew's she returned to New York, where she has since practised her profession with credit and success.

BLACKWELL, THOMAS, a Scottish writer, born in Aberdeen, in 1701, died in 1757; was professor of Greek in Marischal college, and in 1748 took charge of that institution. He published works on Homer and various other classical subjects.

BLACKWOOD'S MAGAZINE, a monthly periodical published in Edinburgh, one of the leading organs of the tory party of Great Britain. Its name is derived from William Blackwood, a sagacious Edinburgh bookseller, who projected it, published the first number April 1, 1817, under the title of "Blackwood's Edinburgh Magazine," and was its proprietor, and, after the first 4 numbers, its editor during the remaining 17 years of his life. He was a zealous partisan of tory principles, and from his first conception of the magazine, determined to make it an assailant of the "Edinburgh Review," which, established and supported by young men and whigs, had for 15 years been offering violence to the cherished convictions and tastes of the tory party. The first numbers were edited by 2 journalists, of repute at the time, Pringle and O'leghorn, and though containing contributions from Sir Walter Scott and Henry Mackenzie, were yet truly characterized as "dull and decent." After the 4th number Blackwood quarrelled with and dismissed his editors, took the editorial care upon himself, and looked about for assistants. He speedily obtained the services of James Hogg, who, by his "Queen's Wake," had just taken rank among the first poets of Scotland, of John Wilson, then in the flush of vigorous manhood, of the gifted and highly cultivated J. G. Lockhart, and of the German scholar and critic, R. P. Gillies, afterward the Kempferhausen of the "Noots." The first article which gave a distinctive and formidable character to the magazine, was that entitled "Translation from an ancient Chaldee Manuscript," for October, 1817. It was couched in biblical language, and divided into chapter and verse, but was in reality a most vigorous and severe satire upon the noted members of the whig party in Edinburgh. The number containing it created astonishment, dismay, and wrath, throughout the capital; it was declared not only unpardonable for its personalities, but an attack on the interests of religion and society, and a ribald and profane parody upon the Bible. Blackwood, in great alarm, determined to withdraw the offensive article, which consequently appeared in only the first 200 copies, and an edition of the magazine containing it is now a rare literary curiosity. The main authorship of this literary rocket is due to Hogg, though all the wits of Maga added points and bitterness to it, and from this time "Blackwood" was looked for, month after month, in the expectation of harsh personalities, an ex-

pectation which at length was not disappointed. The list of writers was now increased by the accession of Dr. Maginn, a learned Irishman, John Galt, the novelist, and Robert Syme, the Timothy Tickler of the "Noctes," and "one of the greatest Tories in all broad Scotland." The overture to the renowned "Noctes Ambrosianæ" was given in 1819 in the series entitled, "Christopher in the Tent," and from this time the *eidolon* called Christopher North was the recognized editor of the magazine. The first of the "Noctes Ambrosianæ" appeared in March, 1822. The series continued till February, 1835, having extended to 71 numbers, and won for the magazine great attention and favor throughout Great Britain, and in America. Dr. Maginn was the principal writer of the earlier of them, but soon the master mind of Wilson became predominant in them, and the series became more valuable as years brought more sober thought to the coterie of writers. The departure of Lockhart to London, in 1826, to edit the "Quarterly Review," took away much of the personal and caustic sarcasm of the magazine; under the ascendant of Wilson more generous impulses prevailed, and the onslaughts upon what was termed the cockney school of literature, which had exceeded in virulence any thing ever before introduced into respectable periodical literature, became less frequent. The contributors to "Blackwood," from this time, embrace many of the most eminent writers of Great Britain. Wordsworth and Coleridge both gave some of their thoughts to the public through this avenue, and Charles Lamb, in his later years, here indulged his delicate fancy. Here Caroline Bowles published her chapters on churchyards, and her simple and touching lyrics; Allan Cunningham wrote "prose by a poet," in the "Adventures of Mark Macrobine;" De Quincey poured out diffusely his subtleties, and Mrs. Hemans occasionally occupied a page or two with some of her noblest poems. Here the attractive novels of Samuel Warren were first published; the "Men of Character" of Douglas Jerrold, the "Marston" of Croly, the "My Cousin Nicholas" of Ingoldsby, the delightful "Literary Lore" of John Sterling, the "Imaginary Conversations" of Walter Savage Landor, and the "Caxtons" and "My Novel" of Bulwer. Here, too, appeared several striking articles, chiefly on American politics and literature, by the American poet and critic, John Neal. Since the death of Wilson, in 1854, his son-in-law, William E. Aytoun, who had been accustomed from his school days to contribute to "Blackwood," has been one of the most prominent of the writers for it. The circulation of "Blackwood's Magazine" has never been lower than 7,500 a month; it has been as high as 10,000, and some numbers have been reprinted more than once; at present the sale is not less than 9,000 a month.

**BLADDER.** The bladder is a musculo-membranous bag, cyst, or pouch, which serves as a reservoir for the urine, secreted in the kidneys. It is called *vesica urinaria*, to distinguish it

from the gall-bladder, a small cyst connected with the liver and the biliary ducts as a reservoir for bile. The bladder is situated in the pelvis, immediately behind the *symphysis pubis*, and in front of the rectum or terminal portion of the intestines, in the male—in front of the uterus and vagina, in the female. Thus placed in the lowest portion of the trunk in front, it communicates by means of 2 long tubes, called ureters, with the 2 kidneys, placed high up in the back, just above the lumbar region, on each side of the vertebral column. It communicates with the exterior by means of a single tube called the urethra, through which the urine is voided. In infancy it is of a pyriform shape, and situated almost entirely in the abdomen; it undergoes a change of form in the adult, and sinks deeper in the pelvic cavity. It then assumes the shape of a short oval, compressed in its anterior and posterior walls; its lower surface expands on the rectum, and forms what is termed by anatomists the *bas-fond* of the bladder. In the female, its transverse diameter is greater than it is in the male, owing to the position of the uterus and vagina between the bladder and the rectum. It increases in dimensions with advancing age, and is larger in females than in males; probably from habitual distention, arising from constraint and female modesty. The direction of the bladder is oblique, being inclined forward and upward. It is retained in its position by appropriate ligaments. Anatomists have divided it into 6 regions or surfaces, for the facility of description and surgical operation: these are named anterior, posterior, superior, inferior, left and right lateral. The anterior surface lies behind the symphysis pubis, with which it is connected by loose connective tissue. When distended, the bladder rises, and its anterior surface comes in contact with the recti muscles of the abdomen. The posterior surface is covered by the peritoneum, which is reflected upon it from the rectum in the male, and from the uterus and vagina in the female. The lateral and superior regions are partially covered by the peritoneum. The inferior region, or *bas-fond*, is the most important in a surgical point of view. It is bounded before by the prostate gland, and behind by the peritoneum. Attached to it, in the male, we find the *vesiculae seminales* and the *vasa deferentia*, which converge to the prostate gland, leaving a triangular space, where the bladder is only separated from the rectum by a quantity of fatty connective tissue surrounding numerous small vessels, chiefly veins. In the female, this region rests on the vagina, which separates it from the rectum. The anterior and inferior regions of the bladder being left uncovered by folds of the peritoneum, enables the surgeon to perform operations on those parts without injuring that membrane, which is so liable to dangerous inflammation from wounds.—The walls of the bladder are composed of 3 layers or coats, united by connective tissue: an internal or

mucous membrane, a middle or muscular coat, and an external or serous coat, formed by folds of the peritoneum. The muscular coat is composed of pale fibres interlacing in all directions, and enabling the bladder to contract so perfectly as to expel every drop of its contents. The neck of the bladder differs in structure from the rest of the organ; being composed of a somewhat fibrous whitish substance, and forming a connecting medium between the bladder and the urethra. Its posterior part rests upon the rectum; its anterior is surrounded below and at the sides by the prostate gland, which is peculiar to the male. This gland is composed of an aggregation of mucous follicles, forming 8 lobes, 1 on each side of the neck of the bladder, and 1 below, communicating by means of small ducts with the urethra. The inner coat or lining of the bladder, being a portion of the genito-urinary mucous membrane, not only lines the bladder, but is prolonged upward through the ureters into the kidneys, and downward along the urethra. It is of a pale rose-color, with a smooth surface when the bladder is distended, and corrugated when empty. This membrane secretes a viscid fluid termed mucus, which protects it from the acrimony of the urine with which it would otherwise be in contact.—The secretion of the urine is performed by the kidneys, which are constantly active, without any apparent alternation of action and repose, although within a given period they do more work at one time than another; as a machine which never stops, may move more rapidly at one time than another. The urine thus secreted dribbles incessantly along the ureters, drops into the bladder, where it accumulates until the walls are distended, and a general uneasy sensation is produced which calls for an evacuation of the contents.—Congenital malformations of the bladder are not unfrequent. Sometimes the bladder is altogether wanting; and in such cases the ureters empty into the rectum, as into the cloaca of birds, or at the pubes, or directly into the urethra. A still more frequent malformation is that in which, the lower portions of the recti muscles being imperfect, and the anterior wall of the bladder deficient, the posterior wall is protruded and forms a red fungus-like tumor above the pubes. The tumor presents 2 orifices, which are the mouths of the ureters, from which the urine constantly dribbles. Blasius describes a case in which the bladder was double. Mollinetti, it is said, found in a female subject 5 kidneys, 5 ureters, and 5 bladders.—Inflammation may affect the coats of the bladder singly or together. When the mucous membrane is inflamed, there is a sense of irritation and a constant desire to discharge the contents. Ulcers, gangrenous spots, and indurations of various kinds may be produced by inflammation. The secretion of the mucous membrane may be increased or altered, constituting what is termed catarrh of the bladder. The mucous membrane is sometimes found in a varicose

state. In other cases it gives origin to cysts of different kinds, and fungous growths; the latter occur mostly in old people. Various accidents and diseases may prevent the bladder from evacuating its contents, in which case it becomes excessively distended, and, unless relieved, inflammation ensues, a portion mortifies, through which the urine escapes into the abdomen, and speedy death is the result. After 8 days' retention the bladder usually attains its utmost limits of distention, and, if not relieved, the contents are evacuated in small quantities, as they would be in a case of mere incontinence of urine; and it is of great importance, therefore, not to mistake retention for incontinence where there is this point of similarity in their respective symptoms. When there is danger in delay, and a catheter cannot be introduced, the bladder may be punctured, either through the perineum or the rectum, or above the pubes, as it is not covered by the peritoneum in these regions.—Where urinary calculi exist in the bladder, they are removed by surgical operations. When small, they may be extracted through the urethra by a pair of forceps invented for the purpose; when large, they may sometimes be reduced into small pieces, minute enough to pass away with the urine; and where this is not practicable, they may be removed by cutting into the bladder.—In the whole class of birds there are no urinary bladders; the ureters descend from the kidneys and open into the cloaca, a musculo-membranous bag, which takes the place of the rectum, the uterus, and the bladder of the higher animals, and serves as a reservoir for solid excrement, for urine, and for eggs. In these animals the urine dilutes the feces, and forms the carbonate of lime, or hard substance of the shell. The urinary bladder exists in several genera and species of fishes.

BLADEN, a south-eastern county of North Carolina, with an area of about 800 sq. m., bounded on the N. E. by South river, and intersected by the Cape Fear, which is here navigable by steamboats. The surface is generally level, and diversified by a number of small and beautiful lakes, abounding in excellent fish. Much of the land is occupied by extensive pine forests, valuable for the tar and turpentine which they yield in large quantities, and for the preparation of which there were in the county in 1850, 6 distilleries and 41 manufactories. The agricultural products during the same year amounted to 217,415 bushels of corn, 100,523 of sweet potatoes, and 78,580 pounds of rice. The county was organized in 1784, and was named in honor of Martin Bladen, one of the lords commissioners of trade and plantations. Elizabeth is the capital. Pop. in 1850, 9,787, of whom 4,858 were slaves.

BLADENSBURG, a small town in Prince George county, Maryland, on the east branch of the Potomac, about 6 miles east from Washington, with about 150 houses. It is a post town and the centre of a large agricultural population, at one time rivalling or contending with

Alexandria, Va., and with Georgetown. Near it are many large plantations, now, however, nearly exhausted. At the bridge over the Potomac west of Bladensburg, the battle with the English which preceded the capture of Washington by Cookburn and Ross, took place Aug. 24, 1814.

BLADON, a parish in the co. of Oxford, England. It is the seat of an almshouse for poor women, which in 1798 was endowed by the duchess of Marlborough with £3,000 consols.

BLAEU, or BLAUW, WILLEM, a learned printer of Amsterdam, died in 1688, the friend and pupil of Tycho Brahe. His atlas, treatises of the globes, and other works, have preserved his memory.

BLAGRAVE, JOHN, the author of several scientific works, chiefly mathematical, born at Sunning, in Berkshire, died in 1811. Among his published writings are, "A Mathematical Jewel," *Astrolabium uranicum generale*, and "The Art of Dialling."

BLAINE, EPHRAIM, an officer in the revolutionary war, belonging to the Pennsylvania line, died at Carlisle, Pa., in 1808. He entered the army as a colonel, at the commencement of the war, and was subsequently made commissary general. His services were gallant and patriotic. He was with Washington in many of the most trying scenes of the revolution, and enjoyed the confidence of his chief to the fullest extent. During the "dark winter" at Valley Forge, the preservation of the American army from starvation was in a great degree owing to the exertions and sacrifices of Col. Blaine.

BLAINVILLE, HENRI MARIE DUROTAY DE, a French naturalist, born Sept. 12, 1777, at Arques, near Dieppe in Normandy, died in Paris, May 1, 1850. He received his first rudiments of education from a Catholic priest with whom he was placed in a neighboring town, at a very early period. He was afterward sent to a boarding school, and from that to the military school of Beaumont-en-Auge, and placed under the direction of Benedictine monks. This establishment was demolished by the revolution of 1792, and De Blainville returned home. In 1794 or 1795 he entered the school of design at Rouen. In 1796 he went to Paris, where he entered as a pupil in the studio of Vincent, the historical painter. There he pursued his studies for some time, being exempted from the conscription in consequence of an accident which rendered him ineligible for military service; and sometimes went to hear lectures on science in the college of France, and on one occasion to hear Lefebvre-Gineau on natural philosophy. He became deeply interested in the study of physical science, and soon made the acquaintance of the professor. In company with one of his young friends, Constant Prévost, he began to frequent the lectures on natural history at the garden of plants, and at the college of France. The lectures of Cuvier were then very celebrated, and De Blainville became one of his most diligent

disciples and attentive hearers. His studies of art gave way to those of science. He became acquainted with scientific men, and following the advice of Duméril, at that time assistant professor to Lacépède in the museum of natural history, he gave all his time to the study of human anatomy. He thus became a regular student of medicine, and Aug. 30, 1808, obtained his degree of M. D. On that occasion his thesis was entitled "Propositions extracted from an Essay on Respiration, followed by practical Experiments on the eighth pair of Nerves in Respiration." During some years, in concert with the German naturalist, Oppel, he gave great attention to the study of reptiles, and myology became a favorite branch of study with him. Cuvier became interested in his studies, and requested his coöperation in a work on comparative anatomy, on which the great master had been long engaged, but not with a view to an early publication. De Blainville accepted, and took his place in the laboratory of the illustrious professor. Soon afterward Cuvier asked him to supply his place as professor at the college of France and at the Athénæum. This position gave eminence to De Blainville; and a vacancy occurring in the chair of anatomy and zoology in the faculty of sciences of Paris, De Blainville sustained, March 31, 1812, his celebrated thesis on the *ornithorynchus*, or duck-bill, and obtained the professorship. From unknown causes Cuvier and De Blainville became estranged from each other about this time, and never afterward were reconciled. The temper of De Blainville was irascible, and it is conjectured that he could not easily brook difference of opinion on any of his favorite ideas. He evidently undervalued the labors of Cuvier, and the latter took no notice of him or of his views, after the rupture. In 1814, the section of zoology placed De Blainville first on the list of candidates for the place left vacant by the death of Olivier, in the academy of sciences; but Latreille was elected. 2 years later, Duméril was elected on the death of Tenon; but in 1825, De Blainville was elected successor to Lacépède, as a member of the academy of sciences. At the death of De Lamarck, Dec. 18, 1829, the chair of natural history, at the garden of plants, was divided into several professorships, and De Blainville was appointed to the department of mollusca, zoophytes, and worms. On July 23, 1832, he left this chair to become the successor of Cuvier, in the chair of comparative anatomy. During the 18 years that De Blainville occupied this place, he continued the work of Cuvier on the fossils of extinct species; but while Cuvier had only consulted the skeletons of living species as a means of comparison with fossil species, De Blainville attempted to treat the osteology of all types of organism, living as well as extinct, under the title of *Ostéographie, ou description iconographique comparée du squelette et du système dentaire des cinq classes d'animaux vertébrés récents et fossiles*. The work, however, was never finished; about 80 genera of mammalia only being

treated at the time of his death, which occurred suddenly in a railway carriage, as he was proceeding on a visit to his niece at a short distance from Paris.—The scientific works of De Blainville are very numerous, and treat of divers questions and investigations in relation to the animal kingdom. Like Ouvier, his whole life was spent in the study of comparative anatomy and zoology. In his *Prodrome d'une nouvelle distribution méthodique du règne animal* (Paris, 1816), he pointed out several modifications in the classification of animals which have since been generally accepted. In his *Dictionnaire d'histoire naturelle* he published a remarkable treatise on worms, which marks an epoch in the progress of that branch of science. Beside numerous contributions to scientific periodicals, he published a work entitled *Éléments Français* (Paris, 1821, 1830), a *Cours de physiologie générale et comparée, professé à la faculté des sciences de Paris* (1833), *Manuel de malacologie et de conchyliologie* (Strasbourg, 1825-'27), and *Histoire des sciences naturelles au moyen âge* (Paris, 1845). In the classification of animals, De Blainville was decidedly of opinion that the external form should be the leading characteristic feature, in forming groups and families of allied species; while other naturalists maintain that the internal structure of animals is of more importance in pointing out affinities and similarities of form and structure, as guides to a natural method of classification.

BLAIR, a S. W. county of Pennsylvania, with an area of 650 square miles. It is drained by Clover creek, the Little Juniata, and one of its branches. The surface is very rugged, and nearly half of the land is unfit for cultivation. The Alleghany mountains form the western boundary; Dunning's and Brush mountains traverse the interior, and in the eastern part of the county rises Tussey's mountain. Between these ridges lie fertile and highly cultivated valleys, the soil of which is well adapted to the production of grain and hay. Bituminous coal is found in the western part, and there are numerous and valuable mines of iron. The county yielded in 1850, 267,349 bushels of wheat, 145,851 of corn, 173,017 of oats, 13,637 tons of hay, and 203,088 pounds of butter. There were 80 flour and grist mills, 12 saw mills, 8 iron mining establishments, and a number of furnaces, forges, factories of various kinds, tanneries, &c. The public schools contained 3,249 pupils; there were 89 churches, and 4 newspaper offices. Blair county was formed in 1845-'6, out of portions of Bedford and Huntingdon, and was named in honor of John Blair, one of the first settlers of this part of the state. Capital, Hollidaysburg; pop. in 1850, 21,777.

BLAIR, FRANCIS PRESTON, an American journalist and politician, born at Abingdon, Washington co., Va., April 12, 1791. His father, James Blair, afterward attorney-general of Kentucky, removed to that state about 1800; the son was graduated at Transylvania university; studied law, but from ill health and weakness

of voice never engaged in its practice; volunteered, however, as a private soldier in 1812, and marched toward the Canadian frontier, but was taken sick and left behind on the way. Early a politician, he was a friend of Mr. Clay, and supported him for the presidency in 1824, but separated from him after he gave his vote for J. Q. Adams and entered the Adams administration; but this did not extinguish their personal friendship, which remained even after the ardent controversies in which they were subsequently engaged. Before this final separation from Mr. Clay, Mr. Blair had diverged from his policy in various local questions, and still more in opposing the U. S. bank, and in contending for the power of the states to tax its branches. When, in the first year of Gen. Jackson's administration, the nullification movement was developed, an article against it, written by Mr. Blair, in a newspaper of Kentucky, attracted the notice of the president, and resulted in an invitation to Mr. Blair, though he was then personally unknown to Gen. Jackson, to remove to Washington and become the editor of a democratic journal to be established there. Under such auspices the "Globe" was commenced in Nov. 1830; and there soon grew up a most intimate and confidential relation between the president and the editor, which continued until Gen. Jackson's death. Mr. Blair retained the control of the "Globe," notwithstanding the opposition of several prominent democrats who were inclined to favor the re-chartering of the U. S. bank, throughout Gen. Jackson's 2 terms of office; and subsequently, through the terms of Van Buren, of Harrison, and of Tyler, until the accession of Mr. Polk to the presidency in March, 1845, who required him to sell that journal to Mr. Ritchie, on the ground that the change was necessary to the harmony of the democratic party. Mr. Polk afterward besought him to resume his position as editor, but he declined, as he did the offer of the Spanish mission for himself and of another diplomatic appointment for his son. He retired to Silver Spring, Montgomery co., Md., where he has since been successfully engaged in agriculture. In the presidential election of 1848, he withdrew from the democratic party and supported Mr. Van Buren and the Wilmot proviso. After the repeal of the Missouri compromise, he took a prominent part in the organization of the republican party, and in the attempt, in 1856, to elect Col. Fremont to the presidency.—FRANCIS PRESTON, JR., a leader of the free-labor or emancipation party in Missouri, 8d son of the preceding, born at Lexington, Ky., Feb. 19, 1821; was graduated at Princeton college, N. J., in 1841; and took up his residence in St. Louis, Mo., and devoted himself to the law. In 1845 he made a journey to the Rocky mountains with a party of trappers for the improvement of his health; and on the breaking out of the Mexican war he joined the force under Kearney and Doniphan in New Mexico, and served as a private soldier until

1847, when he returned to St. Louis and resumed the practice of his profession. In 1848, like his father, he gave his support to the free-soil party and to Mr. Van Buren, and in a speech delivered at the court-house in St. Louis contended against the extension of slavery into the territories of the union. In 1852 he was elected from St. Louis co. to the legislature of Mo., as an avowed free-soiler; and he was re-elected in 1854, though Col. Benton, the congressional candidate of his party, was beaten. In 1856 he was himself returned to congress from the St. Louis district, over Mr. Kennett who had defeated Col. Benton 2 years before. In Jan. 1857, he delivered an elaborate speech in the house of representatives in favor of colonizing the black population of the United States, in Central America. Mr. Blair has also been an editor and writer of the "Missouri Democrat," a daily journal of St. Louis, which constantly advocates the political and economical principles with which he has become identified.

BLAIR, HUGH, a Scotch divine and author, born in Edinburgh, April 1, 1718, died Dec. 27, 1800. In 1759 he delivered his course of lectures on rhetoric and belles-lettres, which were so well received that the king was induced to establish a professorship of rhetoric and polite literature at the university of Edinburgh, and to appoint Dr. Blair its first professor. In 1768 he published a dissertation on the authenticity of Macpherson's "Ossian," and in 1777 the first volume of his sermons, subsequently followed by 4 others. These discourses were not only sought after in England and Scotland, but were even translated into foreign languages. They were dedicated to the queen, at whose instance a pension of £200 a year was conferred on their author. To this annuity an additional £100 was added in 1788, on account of his failing health. In that year his lectures were published in 3 volumes, 8vo.

BLAIR, JAMES, first president of William and Mary college, in Virginia, a native of Scotland, died Aug. 1748, at an advanced age. Not succeeding in that country as a minister of the Episcopal church, he went to England, where he became intimate with Compton, bishop of London, who sent him as a missionary to Virginia in 1685. In this capacity he evinced so much ability and zeal that he was raised to the high office of ecclesiastical commissary of the Virginia church in 1689. He was so anxious to promote the educational interests of the colonists that he undertook a voyage to England, after the accession of William and Mary, to raise funds and obtain a patent for the erection of a college in his adopted country. He succeeded beyond his most sanguine expectations, and on his return he superintended the erection of a college, which he named after the reigning sovereigns, and of which he was president for nearly 50 years. He was also president of the council of Virginia and rector of Williamsburg for many years. His sermons were published in London in 1722, in 4 vols. 8vo.

BLAIR, JOHN, one of the associate judges of the supreme court of the United States, born in Virginia in 1782, died Aug. 31, 1800. He was a judge of the court of appeals in his native state in 1787, and a member of the convention which framed the constitution of the United States. After the establishment of the federal government, Washington appointed him one of the federal judiciary. This office he held till his death, which took place at the age of 68. He was distinguished for the admirable virtues of his private character, no less than for the ability with which he discharged the functions of public office.

BLAIR, JOHN, chronologist and geographer, born in Scotland, died June 24, 1783. In 1754 he published his "Chronological History of the World, from the creation to A. D. 1753." He now received in succession several ecclesiastical preferments, was appointed, in 1757, chaplain to the princess dowager of Wales, and in 1768 was selected to accompany the duke of York on a tour to the continent.

BLAIR, ROBERT, Scottish poet, author of the "Grave," born at Edinburgh in 1699, died Feb. 4, 1746. He was minister of Athelstaneford, in East Lothian, where he spent most of his life.

BLAIR-ATHOL, a village and parish of Scotland, in the county of Perth, 76 miles from Edinburgh; pop. in 1851, 2,084. It contains Blair Castle, a seat of the duke of Athol, and formerly a baronial fortress, occupied by Montrose in 1644, stormed by Cromwell's troops in 1653, and defended by Sir Andrew Agnew, in 1746, against a portion of the pretender's army. The pass of Killiecrankie, famous as the scene of the victory of the Highlanders under Dundee over King William's troops, under Mackay, is distant about 2 miles from the castle. Two miles to the westward are the falls of Bruar, celebrated by Burns.

BLAIRSVILLE, the largest post borough of Indiana co., Pennsylvania, situated on the Conemaugh river and on the Pennsylvania canal, at a distance of 75 miles by canal from Pittsburg, and about 8 miles from the central railroad. It has facilities for an active trade, and is the shipping point of nearly all the grain, pork, lumber, and coal exported from the county. It has a number of substantial buildings, 5 or 6 churches, 2 newspapers, and a handsome bridge, which crosses the Conemaugh river with a single arch of 295 feet. Pop. 1,135.

BLAIRSVILLE, the capital of Union co., Ga., is situated in the midst of a valuable mineral region, possessing quarries of marble and rich mines of gold and iron. The surrounding scenery of the Blue Ridge can hardly be surpassed for grandeur and magnificence. Blairsville contains a court house, a school, 2 hotels, and a few stores.

BLAKE, FRANCIS, a New England lawyer, born in Rutland, Mass., Oct. 14, 1774, died in Worcester, Feb. 28, 1817. He graduated at Harvard college at a very early age, was admitted to the bar in 1794, and commenced practice in Rutland,

whence he removed to Worcester in 1809. As an advocate he was the acknowledged head of the bar of his own and the adjoining counties. Two or 3 orations and tracts are the sole printed memorials of his splendid talents.

BLAKE, JOHN LAURIE, D. D., an American author and Episcopal clergyman, born at Northwood, N. H., Dec. 21, 1788, died at Orange, N. J., July 6, 1857. His early years were passed upon his father's farm, where he labored diligently during the summer months, and attended the district school in the winter. As he grew up he manifested a decided predilection for mechanics, and when about 18 years of age was apprenticed to a cabinet maker, with whom he worked 2 years, and then bought the remainder of his time and went to Salem, Mass., where he labored as a journeyman. Under the ministry of the Rev. Samuel Worcester his attention was turned to religious subjects, and he finally made a public profession of religion in connection with Mr. Worcester's church. Very soon after this he formed the determination to procure a collegiate education, and at the age of 17 quitted the work-bench, and entered Phillips academy at Exeter, N. H., then under the care of the celebrated Dr. Benjamin Abbot, to prepare for college. In 1808 he entered the sophomore class of Brown university, and graduated in 1812. In 1814 he made his first appearance as an author, publishing at that time his "Text Book of Geography and Chronology," a work of which several editions were subsequently sold. In 1818 he was licensed by the Rhode Island association of Congregational ministers, but preached but little in that connection. Having formed the acquaintance of the Rev. Dr. Crooker, then rector of St. John's church, Providence, he became interested in the church service, and, after considerable hesitation, determined to enter the ministry of the Episcopal church. Accordingly, he was admitted to deacon's orders in 1815 by Bishop Griswold, and became the fourth Episcopal clergyman in the diocese of Rhode Island. Soon after his ordination he organized the parish of St. Paul's at Pawtucket, now one of the largest in the diocese, where he remained nearly 5 years, and was eminently successful in his ministry. In 1820 he returned to New Hampshire, and taking temporary supervision of the churches in Concord and Hopkinton, established at the former place a young ladies' seminary, which, in 1822, he removed to Boston, where it attained a very high reputation. He continued in this school till 1830, having charge also of St. Matthew's church in that city most of the time. It was here that he fairly commenced his career of authorship, publishing first the text books which he had prepared for his own classes, the peculiar and original features of which led to their extensive introduction in other schools. Subsequently, he was connected for a time with the "Literary Advertiser" and with the "Gospel Advocate," as editor, and rendered efficient service to the public schools of Boston

as an active member of the school committee for several years. In 1835 appeared the first edition of his "Biographical Dictionary," a work of great labor, and one by which he is best known. The first edition had a very large sale, and the revised work, issued only a few months before his death, and on the revision of which he had bestowed years of toil, bids fair to be still more widely circulated. Though, like every other biographical dictionary, it leaves much to be desired, it is just to say that it is surpassed by no work of the kind in a single volume. After leaving his school in 1830, he devoted himself exclusively to literary pursuits, and acquired the reputation of being a very prolific author. He was the writer or compiler of nearly 50 different works, of which the greater part were text books for schools, embracing a series of reading books, treatises on astronomy, chemistry, natural philosophy, botany, geography, and history. There were also 2 or 3 volumes on rural economy, the "Family Cyclopædia," "Letters on Confirmation," a volume on prayer, sermons, addresses, &c.

BLAKE, ROBERT, English admiral, born at Bridgewater, in Somersetshire, Aug. 1599, died at Plymouth, Aug. 17, 1657. He was the eldest son of a merchant who had become rich and settled at Bridgewater. He graduated at Oxford in 1617, and then lived gravely and peacefully in his native place, taking no open part in politics, although he had adopted the principles of the Puritans, and was theoretically an ardent republican. In the parliament of 1640 he was returned member for Bridgewater, and so soon as it appeared certain that the differences between the king and the nation could not be settled except by the sword, he applied himself to military affairs, and took up arms among the first against the king in the west of England, where, until near the end of the war, the royalists were constantly superior, and were only prevented from becoming all-powerful by the stubborn obstinacy with which 2 or 3 insignificant places, scarcely deserving the name of fortified towns, held out against regular armies, and supported sieges of such duration as to produce the greatest effect on the general results of the war, by rendering it impossible for the cavaliers to concentrate their forces in the eastern and northern counties, and crush the parliamentarians where they were the strongest. Two of these places—Lyme Regis on the coast of Dorsetshire, which detained Prince Maurice before its hardly defensible walls until his army melted away; and Taunton, in his own county of Somerset, which, though small, ruinous, and half destroyed, resisted all the efforts of Granville and Goring, with 8,000 foot and 8,000 horse, until the war was ended by the defeat and capture of Lord Astley at Stowe-on-the-Wold, in 1646—owed their defence to the stern and resolute character of this natural commander, who had never served an apprenticeship in arms, nor, it is most likely, had ever seen a battalion set in array before the 43d year

of his age. In 1649, after the execution of the king, the navy having remained firm in its allegiance, Prince Rupert, who had been appointed admiral, rode the channel in defiance, and, it is believed, might at an earlier date, when the king was a prisoner in the isle of Wight, have rescued him by a well-concerted and sudden *coup-de-main*. But now the commonwealth being firmly established, its rulers began to look about them for an officer fit to take command of the squadron which they proposed to fit out, in order to retrieve the mastery of their own coasts at least, and, if possible, to recover something of the reputation which the English nation had formerly possessed at sea. Whether it was the military genius which Blake had exhibited at Lyme and Taunton, or, what is more probable, his stern republican principles, that recommended him to the men who sat at the helm of the republic, does not appear; nor is it even clear that he had ever been on board a ship of war, when he was appointed, at the mature age of 50, to command a squadron of the line, with the title of general of the sea. His orders were to pursue Rupert, with the royal squadron, whithersoever he should find him. During the preceding year the prince had lain within the harbor of Kinsale, protected by the batteries on land, but strictly blockaded by a superior force without, until Cromwell's progress by land gave him assurance that the batteries which hitherto had protected him would shortly be turned against his vessels, when he ran the gauntlet of the blockading ships, and, with the loss of three of his squadron sunk or taken in the attempt, made his way into the Tagus, where he received the protection of the king of Portugal. In the spring Blake appeared off the mouth of that river with 18 sail, and sent in a flag requesting permission to attack the pirate at his anchorage. To this request he received a point-blank refusal, when he stood in, with open ports and lighted matches, but was unable to force his way up, or was unwilling to incur the risk of losing his ships, when he well knew himself possessed of the power to enforce his demands. To this end, he at once proceeded to capture 20 Portuguese galleons, richly laden, which he sent in as prizes to the English channel harbors, threatening to continue his seizures until the king should expel the enemy. This the Portuguese speedily found it their interest to do, and Rupert set sail for the West Indies, where the Bermudas, Antigua, and Virginia still feebly held out for the crown. He lost, however, a considerable part of his squadron, by an attack of Blake, off Malaga (Jan. 1651). His brother Maurice was shipwrecked in a hurricane among the islands, and, after a while, subsisting himself and the ships under his command by privateering, or what may be more properly called piracy, he returned to France; where, finding the seas too hot to hold him, he sold both the remains of his own squadron and his prizes. In the mean time, the colonies were easily reduced by Sir George Ayscue, while the

channel islands, Jersey, Guernsey, and the Isle of Man, the latter defended by Charlotte, countess of Derby, were brought under subjection by Blake. For some years after this the government of England was not so strong at home, being engaged in intestine conflicts in Ireland and Scotland, as to undertake any foreign war. But affronts had been offered to the republic by the states-general of Holland which it was determined to resent. During the lifetime of William II. of Orange, who had married a daughter of Charles I., no redress could be had for the slaughter of Dr. Dorislaus, the envoy of the commonwealth at the Hague, nor could Strickland, the resident ambassador, obtain a hearing. On the death of that prince, when it was supposed that the democratic party in the states would have obtained the preëminence, on account of the long minority of his heir, afterward William III. of England, negotiations were renewed by England, with a view either to the erection of a great consolidated republican power, by a close alliance of the 2 governments, or to the creating of a rupture which should afford a pretext for hostilities. The latter was the result, for the cavaliers and the young duke of York, in person, offered insult, and even personal violence, to the envoys, which the states-general did not punish; and the English government having prescribed a precise day, before which their proposals must be offered or withdrawn, the commissioners returned to England. The English asserted that the Hollanders were awaiting the termination of the struggle between Charles, who had been proclaimed king of Scots, and Cromwell; while the other side laid the blame on the arrogance and undue haste of the ambassadors. In the mean time, the "crowning mercy" of Worcester turned the scale of affairs, and the states-general now sent, in their turn, to London to seek accommodation. But they found the aspect of the case wholly changed. The English navigation laws had just been passed, which, in their operation, would deprive the Hollanders of the carrying trade of the world, which they had long enjoyed; and when they asked for their suspension, at least during the pendency of negotiations, not only were they peremptorily refused, but they were met by a counter demand for reparation of the cruelties committed on the English at Amboyna, some 30 years before, by a complaint that the Dutch ships were carrying to the enemy contraband supplies, and by an order to the English naval officers to compel the states' men-of-war to salute the English flag by striking their topsails on meeting in the channel. In the mean time letters of marque were granted by the English government, and above eighty prizes were brought into the English ports; whereon the states-general, refusing to grant letters of reprisal to their own merchants, fitted out a great fleet, not, as they explained to the neighboring powers, that they designed to make war, but merely to protect their commerce. A few days after

this, Admiral Young, falling in with a fleet of Dutch merchantmen, fired into them, and after a sharp action compelled them to salute the British flag. Shortly after this, again, Van Tromp, with 42 sail of Dutch men-of-war, entered the roads of Dover, as he asserted, driven in by stress of weather, with loss of anchors and cables; but, according to Blake's account, in order to insult the English fleet as it lay at anchor, and to refuse it the salute which, possibly, the Orange party, to which Van Tromp belonged, considered due to the king, not to the nation. It is a question to this day which party commenced the attack, for each admiral sent in a relation, countersigned by every captain in his fleet, differing in every particular from that of the other. Blake had in the beginning but 15 ships, but Capt. Bourne joined him with 8 more after the action had commenced. It has been alleged: 1, that it is improbable that the Dutch, who had already sought for peace by negotiation, should have commenced the affray; and 2, that it is yet more improbable that the English, with but 23 ships, should have begun hostilities against a fleet of 42. Neither answer is, however, complete, since it is more than probable that Van Tromp's own temper, which was hot and fiery, and the politics of the war party, to which he belonged, would have rendered him willing somewhat to exceed his orders, in order to bring about an affront to the Dutch flag, such as should arouse the national anger, and render war inevitable; while it was clearly not in Blake's character to take account of odds, or to decline attacking a superior force when he thought it necessary. However this may be, Van Tromp with the Dutch fleet retired to his own shores, with the loss of 2 ships of 80 guns, 1 taken and 1 sunk, the action lasting 5 hours, and being terminated only by night (May 19, 1652). The Dutch sent commissioners to explain, and, if possible, to put off the war, on any endurable terms; but the English parliament was insolent and inexorable, and replied only by a fresh demand for reparation, which not being made, energetic hostilities followed. Blake's first operation was an onslaught on the Dutch herring busses to the northward, escorted by 12 ships of war, in which he took or dispersed the whole convoy. Van Tromp pursued him with a fleet of above 100 sail; but when the 2 admirals were in sight of each other, and engaged in clearing for action, they were separated by a furious storm, which dispersed and greatly shattered the Dutch fleet, while the English admiral got off cheaply into the English harbors. Shortly after this, Aysoue, who had just returned from the reduction of the West Indies, with 40 ships of war, fell in with De Ruyter, commanding 50 ships of war and 80 merchantmen. The action lasted till it was closed by night, when the Dutch convoy and the covering squadron got off uninjured, owing, it is said, to the remissness of the inferior officers of Aysoue's squadron. He was, however, removed from his command by the parliament, who suspected him of lean-

ing toward the royal cause, though they rewarded his services in America by a pension and grant of Irish lands. De Witt was now joined by De Ruyter, Van Tromp having resigned in indignation at the temporary unpopularity into which he had fallen on the dispersion of his great armament, and a long and obstinate action was fought off the coast of Kent (Sept. 28), in which the ship of the Dutch rear-admiral was carried by boarding, 2 other capital ships were sunk and one blown up, and as before, night separated the combatants. On the following day, however, the Dutch fleet made all sail for Goree, and, getting into shoal water, where the heavy English ships could not follow them, escaped by their light draught.—After this action, Blake, who supposed that winter would bring a suspension of hostilities, divided his fleet into squadrons of observation, and retaining himself only 87 ships, was attacked (Dec. 9), near the Goodwin Sands, by Van Tromp, who had received a fresh commission, at the head of twice that number of sail, and not choosing to decline battle, fought all day with desperate courage, and at night carried off his shattered squadron, and secured it within the mouth of the Thames. The English burnt 1 large ship of the enemy and disabled 2 others; but they lost the *Garland* and the *Bonaventure*, and 4 other ships, burned and sunken. Blake himself was severely wounded, but he gained rather than lost honor; since his defence was admirable, against a force so superior, and his saving his fleet, under the circumstances, was regarded justly by his countrymen as equivalent to a victory. It is this battle, the results of which so intoxicated Van Tromp that he insulted all the coasts of England, sailing the channel with brooms at his mast-head, as if he would sweep or had already swept the narrow seas of the English fleet, and which so delighted the Hollanders that Europe was flooded by them with prints, publications, broadsides, and pamphlets, both in prose and verse, recounting their exploits and the defeat of their enemy. The English people were proportionately roused and excited. A large number of new and large ships were put in commission; 2 regiments of infantry were embarked to serve as marines; and in February, 1658, Blake was enabled to take the sea again, at the head of above 70 sail. On Feb. 18, Van Tromp, having gone down to the isle of Rhé, to convoy the homeward bound fleet, with 76 vessels of war, made his appearance in the channel with 800 merchantmen, when Blake intercepted him off Portland island, and immediately attacked, with signals for the closest action flying at all his mast-heads. From morning till night of the first day, the battle raged at close quarters. Blake was again severely wounded, and had 1 of his ships sunk; but he had taken 6 of the enemy and disabled many more, and the success of the day was his. On the following morning, at daybreak, the action was renewed, off Weymouth, the Dutch admiral interposing his ships

of war in a great semicircle, to cover the evasion of his convoy, and making signal to his merchantmen to shift for themselves. Again, during the whole day, the whole width of the channel was filled with the contending fleets, and the rocks of the Norman coast and the flat shores of Dorsetshire and Hampshire were shaken equally by the roar of the rival cannon of the 2 powerful and rich republics. The struggle was as obstinate as on the previous day; but, as before, the success leaned to the English side. On the 3d morning, off Boulogne, the terrific contest recommenced, and again lasted until night, when the Dutch, at the end of a long running fight, got into shoal water, and succeeded in getting their merchant ships and their sorely shattered vessels under cover of the dangerous shoals and sand-banks which guard their coasts, and bar the mouths of their large rivers. They lost 17 men of war, with 2,000 men killed and 1,500 prisoners, beside 50 sail of their convoys. The English had 1 ship sunk, but none taken, and lost no prisoners; their slain were little if at all inferior to those of the Hollanders. Van Tromp lost no honor, for the conduct of his retreat was masterly, and the inferiority of his ships in size and weight of metal, if it ultimately favored his escape, accounted for his inability to support the close attack of the English. The extraordinary gallantry of the Dutch defence may be estimated by the fact that the English loss in this action, of men killed and wounded, was greater than in the annihilating victory of Trafalgar, where 26 sail of the line were utterly destroyed or taken, with 20,000 prisoners, at a loss of only 1,690 English killed and wounded. The real loss of the Dutch, however, now that their fleets were shut up in their harbors, consisted in the annihilation of their fisheries, and the ruin of their trade by the English privateers, which took no less than 1,600 prizes, and, while they utterly closed the channel to their trade, infested the north sea, and made even the Baltic too hot to hold them.—At this crisis of the war, the long parliament was dissolved by Cromwell, who assumed the absolute government of the realm, and infused fresh vigor into the conduct of the war. It was now that Blake displayed his patriotism, not inferior to his conduct or courage; for, although it is known that he was a stern republican, he preserved the fleets, by his own influence with the men, firm in their duty to the government *de facto*, telling his officers that "it was not for them to mind state affairs, but to keep the enemy from fooling them." Later in the year, the contests of the fleets were renewed with equal fury, equal obstinacy, and the same result. They fought again 2 terrible actions, June 8 and 4, 1653, each of one day's duration, in which the Hollanders lost 20 ships, and were, in the end, compelled to retire into shoal water. After this the bad health of Blake compelled him to leave the sea, and he was not present at the battle of July 29, in which the Dutch lost, beside ships and men,

their great admiral Van Tromp, who was shot through the heart by a musket-ball, while animating his men, sword in hand, to the attack. His death closed the stubborn strife, for the Dutch were determined by it to make such submission as would secure a peace, which they were enabled to do on terms so favorable as showed the war in itself to have been impolitic and nearly causeless. In fact, it was waged on both sides without animosity, with little expectation of advantage, and in the main, *honoris causa*, for the empty glory of being called sovereigns of the sea.—After this, Blake was reflected by his old constituents for Bridgewater, and was received with extraordinary honor by Cromwell, who little cared what were a man's abstract opinions, and still less whether he was politically hostile to himself or not, so long as he did his duty to the government. When that great man found it necessary to make a demonstration in favor of the European Protestants, and caused it to be intimated to the pope that, under certain contingencies, his Holiness would be likely to hear the sound of English guns in the Vatican, Blake was the person whom he chose to uphold the character of the nation in the Mediterranean, as he had already done in the narrow seas. He brought the duke of Tuscany to terms; he forced the dey of Algiers to conclude an ignominious peace, and, entering the harbor of Tunis, he silenced the castles which defended it with his broadsides, and burned every ship within the defences with his long boats. Subsequently, war being declared against Spain, in 1656, on grounds which were so doubtful that many officers threw up their commissions rather than obey, he took the view that it is always a soldier's or a sailor's duty to obey his orders, not question them, and performed his most splendid exploits in capturing 2 Spanish silver fleets of galleons; the latter of which he cut out from under the castles and forts of Teneriffe, where Nelson himself met the only considerable reverse which ever befell his arms. Shortly afterward he died of scurvy, just as his victorious fleet was entering Plymouth sound. His body was buried in King Henry VII.'s chapel, in Westminster Abbey, but on the restoration his ashes were removed.

BLAKE, WILLIAM, an English artist and poet, born in London, Nov. 28, 1757, died Aug. 12, 1828. He was apprenticed to an engraver, and before he was 20, had composed some 70 pages of verse, consisting of songs, ballads, and a drama, which were published in 1787, at the instance, and partly at the expense, of John Flaxman, the sculptor. The structure of these verses was often defective; but they abounded in pleasant melody, and fine poetic thought. He studied design for a time under Flaxman and Fuseli. In 1793 he married a most estimable woman, Katherine Butcher, and commenced business as an engraver. He wrote songs, composed music, and painted at the same time; but in the excitement of his labors, he began to conceive that he was un-

der spiritual influences; and as external prosperity was wanting, he grew more and more abstracted and retired, until the visionary tendencies of his nature dominated his life. Among his friends he gave out that the works on which he was engaged were copied from great works revealed to him, and that his lessons in art were given him by celestial tongues. An original and beautiful method of engraving and tinting his plates he ascribed to the dead brother of his wife, Robert. He conversed familiarly with the spirits of Homer, Moses, Pindar, Dante, Sir William Wallace, Milton, and other illustrious dead, and sometimes he wrangled with demons. Yet he continued to pursue his art with assiduity, his wife ever sitting by his side, or assisting him at the press. His earliest work was called "The Songs of Innocence and of Experience;" it was published in 1789, with 65 etched illustrations. The next was "The Gates of Paradise," in 16 small designs, somewhat mystical in character. In 1794 there followed "Ulrich," consisting of 27 singular but powerful drawings, which disclosed the mysteries of hell. He was afterward employed to make marginal illustrations to Young's "Night Thoughts;" and in 1800 he removed to Felpham, in Sussex, to make designs for Hayley's "Life of Cowper." He wrote from his cottage there to Flaxman, addressing him as "Dear Sculptor of Eternity," and saying, in his strange wild way, "In my brain are studies and chambers filled with books and pictures of old, which I wrote and painted in ages of eternity, before my mortal life; and these works are the delight and study of archangels." After returning to London, he published "Jerusalem," a series of about 100 strange designs; 12 designs to Blair's "Grave;" 12 "Inventions" and a water-color painting of "The Canterbury Pilgrims." In 1809 he made an exhibition of this and other works. His best production was the "Inventions for the Book of Job," consisting of 21 illustrations. For the greater part of his life he "lived in a garret, on crusts of bread." He died with his pencil in hand, making a likeness of his wife, and chanting pleasant songs.

BLAKE, WILLIAM RUFUS, an American actor, born in Halifax, Nova Scotia, in 1805. His first appearance on the American stage was at the old Chatham theatre, New York, under the management of Mr. Barrere, in 1824, as Frederic, in the "Poor Gentleman," and in Elliston's favorite character in the "Three Singles." His success was great; and he now stands at the head of his profession. His Jesse Rural, in "Old Heads and Young Hearts," is pathetic and touching to a great degree, bringing domestic comedy to the very frontier of tragic feeling itself. Mr. Blake, who is well educated, is a fluent and effective speaker. He has been stage manager of the Tremont theatre, Boston, joint manager of the Walnut street theatre, Philadelphia, and stage manager of the Broadway theatre, New York.

BLAKELY, JOHNSTON, a master and commander in the U. S. navy, born in Ireland, Oct.

1781, and while very young brought to the United States by his parents, who established themselves in North Carolina. He was educated in the university of that state, and entered the navy as midshipman in 1800. In 1813 he commanded, as lieutenant, the brig *Enterprise*, of 14 guns, in which vessel he cruised very actively upon the eastern coast, and rendered important services in the protection of the coasting trade from English privateers. In August of that year he was promoted to the rank of master-commandant (this title is now altered by law to commander), and appointed to the new sloop *Wasp*, in which vessel he sailed from Portsmouth, N. H., on a cruise, May 1, 1814. June 28, in lat. 48° 36' N., long. 11° 16' W., he fell in with, and captured, after an engagement of 28 minutes, H. B. M. sloop *Reindeer*, Capt. Manners, of 18 24lb. carronades, and 1 shifting gun, and a complement of 118 souls. This action was a very severe one, and, as was usual in the naval combats in the war of 1812, there was a manifest superiority of gunnery on the American side. The upper works of the *Reindeer* were completely cut to pieces, and she had 25 killed and 42 wounded, Capt. Manners among the former, while the *Wasp* was hulled by round shot but 6 times, and had 5 killed and 22 wounded. The *Reindeer* made 3 attempts to board, which were repulsed with great steadiness. In the last attempt, her gallant commander was slain. She was finally boarded in her turn, and carried. The danger of recapture being great, Capt. Blakely destroyed his prize, put into L'Orient with his prisoners, with the exception of a portion of the wounded, who were received by a neutral vessel soon after the action. The *Wasp* sailed from L'Orient Aug. 27, on another cruise, and immediately made several captures, one a vessel laden with guns and military stores, which was, with great address, cut out of a convoy in charge of a line-of-battle ship. On the evening of Sept. 1, while running free, the wind blowing fresh, 4 sail were discovered, 2 on each bow, and the *Wasp* hauled up for the most weatherly of them. At 20 minutes past 9 she was brought to action, which continued 52 minutes, when the enemy surrendered. As the *Wasp* was lowering a boat to take possession, 8 other vessels hove in sight astern, and it became necessary to abandon the prize. One of these vessels pursued, and fired a broadside into the *Wasp*, and then joined the ship which had surrendered, being called to her by signals of distress. It was afterward ascertained that this vessel was the *Avon*, Capt. Arbuthnot, of 18 32lb. carronades, and 120 men, and that her loss was from 80 to 50 in killed and wounded, though this was not known with certainty. The combat was very close. The *Wasp* had but 2 men killed, and 1 wounded, the latter by a wad. The *Avon* sunk soon after the engagement, and the lives of her officers and men were saved with difficulty. The vessel which pursued and fired upon the *Wasp* was the *Castilian*; and

one of the other vessels in sight was also a cruiser. But little more was ever known of the Wasp. She made several captures after her engagement with the Avon, which were destroyed; and on Sept. 21, she captured the brig Atalanta, which being valuable, a prize crew was put on board her, and she was ordered to Savannah, in charge of Midshipman, now Commodore, Geisinger. She arrived safely, and brought the last direct intelligence ever received from the Wasp. Several years afterward, it was shown that on Oct. 9, 1814, nearly 50 days after the capture of the Atalanta, she was spoken by a Swedish brig, and received from her 3 American naval officers, Messrs. McKnight and Lyman, who had been captured in the Essex, exchanged, and were then on their passage to England, as the only means of reaching the United States. Vague rumors as to her fate have prevailed from time to time. One, that an English frigate put into Cadiz, in a very crippled state, and reported that she had engaged and sunk an American corvette. Another, that she was lost upon the coast of Africa, and that all on board her were captured by the Arabs. Another, that about the time her arrival upon the American coast was looked for, 3 English frigates chased an American sloop of war off the southern coast, and that in a violent squall which struck the 3 ships, the sloop suddenly disappeared. None of these rumors were ever traced to an authentic source. The Wasp, like most sloops of war of that day, was a vessel of but little over 500 tons, heavily armed and sparred, and very deep waisted. Such ships are proverbially unsafe, and she probably foundered in a gale. Capt. Blakely was an officer of great merit. He was brave, skilful, and modest, and had he lived, would doubtless have risen to the highest professional distinction. He left a widow, and an infant daughter, who was educated by the state of North Carolina.

BLAKELY, a pleasant, healthy village, port of entry, and the capital of Baldwin co., Alabama, situated on the Tensaw river, just above its entrance into Mobile bay. It is well supplied with water, and contains the county buildings, some handsome dwellings, and numerous stores. Its harbor, which admits vessels of 11 ft. draught, is deeper and more easily accessible than that of Mobile, 12 m. S. W., and it was thought that this would render it a great commercial rival of the latter city—an expectation which is yet unfulfilled.

BLANO, LE, a town of France, in the department of Indre, on the river Creuse. It is a very ancient place, and was often visited by the Roman legions. Pop. in 1856, 5,781.

BLANO, MONT. See MONT BLANO.

BLANO, JEAN JOSEPH LOUIS, a political and historical writer of France, born at Madrid, where his father held the office of inspector-general of finance, under Joseph Bonaparte, Oct. 28, 1818. His mother was a Corsican, and the sister of the celebrated Pozzo di Borgo. At 7 years of age he was sent to school at Rodez, where he

pursued his studies for 10 years, exhibiting great capacity for learning, and unusual ability. He had been originally designed for diplomatic service, but as his father lost his fortune in the revolution of 1830, he was compelled to teach mathematics to earn his support. In 1832 he became tutor to a private family residing at Arras, and while there wrote several articles for a local journal, which attracted attention. Removing to Paris in 1834, he was chosen an editor of the *Bon Sens*, a periodical of considerable influence. He left it in 1838, in consequence of a dispute with the proprietor on an important question of political economy. The next year he established *La Revue du Progrès*, to promote the combination of the democratic associations, and to further the cause of political reform. A treatise on the "Organization of Labor" came from his pen in 1840, and by the spirit and eloquence with which it was written, gave him a position as one of the ablest writers of the socialistic school in Paris. He maintained in it that industry, in its present unregulated and competitive state, impoverishes and debases the working classes, and that it ought to be organized on a principle of community, by which each should contribute according to his capabilities, and receive according to his wants. A more important work, issued not long afterward, was a "History of Ten Years," in which the political incidents of the period from 1830 to 1840 were described with remarkable animation, sagacity, and effect. The work inflicted a dreadful blow upon the administration of Louis Philippe, and is supposed to have exerted a great influence in bringing about the revolution of 1848, by which that monarch was de-throned. When that outbreak came, he was one of the leading spirits of it, was a member of the provisional government from February to May, and as such procured the adoption of a decree abolishing capital punishment for political offences. He also contended for the creation of a ministry of progress, and not being able to carry that measure, withdrew from the government, but, at the request of his colleagues, took back his resignation, and became the president of a commission to consider the labor question, which held its sittings at the Luxembourg, but which accomplished nothing. The foundation of the so-called national workshops, out of which finally grew the insurrection of June, 1848, has been ascribed to him, but in fact he opposed the step; and he has since repeatedly declared, and without any authoritative contradiction, that they were founded rather to injure than illustrate his views of industrial organization. After the insurrection of June, he was accused of conspiracy against the government on the occasion of the previous rising of May 15, in which he had not been included, and on the advice of his friends went into voluntary exile in England. Before that, however, he had commenced a "History of the French Revolution," which he has since continued. It is a work of great research and vigor

of execution, giving the socialistic view of the events of the great insurrection, and describing characters with a rare insight into motives, and a comprehensive philosophy of cause and effect. The first volume, being an introduction to the rest, is the most striking *résumé* of the causes of the revolution, both public and private, that has perhaps ever been written. In person, Louis Blanc is so diminutive as to have the look of a mere boy, but his bearing is grave, dignified, and impressive.

BLANCHARD, FRANÇOIS, aéronaut, born at Andelys, department of Eure, France, in 1738, died in Paris, March 7, 1809. He was distinguished from his youth by his mechanical ingenuity. The invention of the balloon by the brothers Montgolfier, in 1783, greatly interested him, and he constructed a balloon with wings and a rudder, in which he ascended in March, 1784. Jan. 7, 1785, he crossed the British channel from Dover to Calais, for which Louis XVI. rewarded him with a gift of 12,000 francs, and a life-pension of 1,200 francs. He invented a parachute, to break the fall in case of accident, and first used it in London, in 1785. He visited various parts of Europe, displaying his aeronautic skill, and sojourned for a short time in New York. Returning to France, in 1798, he ascended from Rouen with 16 persons in a large balloon, and descended at a place 15 miles distant. In 1808, while making his 66th ascent, at the Hague, he had an apoplectic stroke, from the effects of which he died in the succeeding year.—Madame Blanchard, his wife, who had partaken of his dangerous successes, continued to make aerial voyages; but in June, 1819, having ascended from Tivoli, in Paris, her balloon took fire, at a considerable height, owing to some fireworks which she carried with her, and burnt, while the hapless aéronaut was dashed to pieces on the ground.

BLANCHARD, LAMAN, an English author, born at Great Yarmouth, May 15, 1808, died at London, Feb. 15, 1845. At the age of 5 he was removed to London, where he was educated at St. Olave's school, Southwark. His first occupation was as reader in a printing-office, which afforded him time and opportunity for cultivating his literary tastes. In 1827 he was appointed secretary of the zoological society, in which office he continued until 1831, when he became acting editor (under Bulwer) of the "New Monthly Magazine." He had previously published a small volume of poetry, called the "Lyric Offering." Mr. Blanchard's connection with the magazine so far established his reputation as a ready writer, with aptitude and tact, that he successively obtained editorial employment on the "True Sun," "Courier," "Constitutional," "Court Journal," and "Examiner," beside contributing largely to periodicals and annuals. He touched on a great variety of subjects, in prose and verse, and generally with marked ability. For some time his wife had been insane, and his own health gave way under the contemplation of her affliction. On her

death his mind lost its balance, and he committed suicide. It was alleged that pecuniary pressure was a proximate cause of his own suffering, but Mr. Blanchard, who was not extravagant, always had a sufficient income from his pen, and at his death was not only sub-editor of the "Examiner," but acting editor of "Ainsworth's Magazine," and well paid for both. He was popular with literary men, from his amiable disposition and unaffected manners. His "Essays and Sketches," collected from various periodicals, were published for the benefit of his orphans, in 3 volumes, prefaced by a very interesting biography of the author, by Sir Edward Bulwer Lytton.

BLANCHARD, THOMAS, an American mechanic and inventor, born in Sutton, Worcester co., Mass., June 24, 1788. From a strong bias for mechanical employments, he joined his brother, who was engaged in the manufacture of tacks by hand, a very slow and tedious process, and at the age of 18 commenced his invention of a tack machine. It was six years before he could bring it to the desired perfection. Finally, so effective was the machine, that by placing in the hopper the iron to be worked, and applying the motive power, 500 tacks were made per minute, with better finished heads and points than had ever been made by hand. For this machine Blanchard secured the patent, and sold the right to a company for \$5,000. About this time various attempts were made in the United States armories at Springfield and Harper's Ferry, to turn musket barrels with a uniform external finish. Blanchard undertook "the construction of a lathe to turn the whole of the barrel, from end to end, by the combination of one single self-directing operation." About 8 inches of the barrel at the breech was partly cylindrical and partly with flat sides; these were all out by the same machine, ingeniously changing to a vibrating motion as it approached the breech. A knowledge of this invention came to the superintendent of the Springfield armory, who contracted with Mr. Blanchard for one of his machines. While it was in operation, one of the workmen remarked that his own work of grinding the barrels was done away with. Another, employed on the wooden stocks, which were then all made by hand, said that Blanchard could not spoil his job, as he could not make a machine to turn a gunstock. Blanchard answered that he was not sure, but he would think about it, and as he was driving home through the town of Brimfield, the idea of his lathe for turning irregular forms suddenly struck him. In his emotion he shouted, "I have got it, I have got it!" The principle of this machine is, that forms are turned by a pattern the exact shape of the object to be produced, which in every part of it is successively brought in contact with a small friction wheel; this wheel precisely regulates the motion of chisels arranged upon a cutting wheel acting upon the rough block, so that as the friction wheel successively traverses

every portion of the rotating pattern, the cutting wheel pares off the superabundant wood from end to end of the block, leaving a precise resemblance of the model. This remarkable machine, with modifications and improvements, is in use in the national armories as well as in England, and in various forms is applied to many operations in making musket stocks, such as cutting in the cavity for the lock, barrel, ramrod, butt plates, and mountings, comprising, together with the turning of the stock and barrel, no less than 18 different machines. Beside gunstocks, it is also applied to a great variety of objects, such as busts, shoe lasts, handles, spokes, &c. Mr. Blanchard was also interested at an early day in the construction of railroads and locomotives, and in boats so contrived as to ascend the rapids of the Connecticut, and rivers in the western states. He has taken out no less than 24 patents for different inventions. From few of them, however, has he realized any considerable sums. At present he resides in Boston, engaged in the bending of heavy timbers by some new and as yet unrevealed process.

**BLANCHE OF BOURBON**, queen of Castile, born in France about 1388, died in Spain in 1361. When 15 she was betrothed to Don Pedro IV. of Castile, afterward called the Cruel. He was already controlled by his love for Maria Padilla, and reluctantly consented to the performance of a purely political marriage. The ceremony took place June 8, 1353, at Valladolid, when the king did not even take the trouble of concealing his indifference, not to say his hatred, for the young and lovely bride. Forty-eight hours later, he fled from her to his mistress. Yielding to the entreaties of Maria, who wished to act with great circumspection, he paid a visit to the forsaken wife; but a stay of 2 days in the same palace was all that his impatience could endure. He then left forever the unfortunate queen, who was sent a prisoner to Tordesillas, on the Douro. Meanwhile her beauty, sweetness of temper, and the harsh treatment of her husband, awoke the sympathy of the people, which was evinced on the occasion of her removal to the Alcazar of Toledo. On her way thither she was allowed to enter the cathedral to say her prayers, and the inhabitants, moved by pity and fearing her life was in danger, rose against the king's officers, and declared they would protect her at the peril of their lives. The city therefore made preparations for defence, and called in the king's bastard brothers, who were then in arms against Don Pedro. The rebels, in the hope that the queen's popularity would serve their cause, proclaimed themselves her champions, but do not seem to have cared much for her safety. The inhabitants of Toledo were more faithful; unfortunately, they were unable to resist the troops of Don Pedro, who took the city by storm. His wife, now again a prisoner, he refused to see, but ordered her to the castle of Sigüenza. From this place she was removed to Xerez de la Frontera. She died suddenly, whether

from poison, as was then generally believed, or in consequence of her sorrows and long imprisonment, it is difficult to decide. The news of her death sent a thrill of pity and indignation through France; and a few years later, when the "great companies" under Du Guesclin, marched into Spain to help Henry Trastamare against Don Pedro, many a knight engaged in the war merely for the purpose of avenging the unhappy Blanche.

**BLANCHE OF CASTILE**, queen of France, born in 1187, died Dec. 1, 1252. She was the daughter of Alfonso IX., king of Castile, by Eleonora of England, sister of Richard the Lion-hearted and John Lackland. By the treaty of peace concluded in 1203, between John and Philip Augustus, it was agreed that Blanche should marry Louis, heir-apparent to the crown of France; the marriage ceremony was consequently performed in the beginning of the following year. Her beauty and sweet temper secured at once the affections of her husband, while her good sense, energy, and prudence won the regard of her father-in-law, who, shrewd monarch as he was, frequently took advice from the young princess. She consequently mingled in political affairs, giving repeated evidence of both ability and decision. In 1216, when her husband was called to England by the lords confederated against John, she insisted upon his accepting their offer; she spared no exertion to help him in this bold undertaking, and sent him money and reinforcements. Undoubtedly, if the English crown could have been won by good management and chivalrous conduct, the young couple would have been successful; but John being dead, the lords returned to their allegiance to his son. Louis saw himself deserted by his former adherents, and a fleet, despatched by Blanche, having been defeated off Dover, Aug. 24, 1217, no alternative was left to him but to return to France. His wife consoled him in his defeat, and, 18 months later, encouraged him in a crusade against the Albigenes. On the death of Philip Augustus, and the accession of Louis VIII. to the throne, she was more than ever the inspiring genius of her husband. She accompanied him in his new crusade against the Albigenes, and received from him, on his death-bed, at Montpensier, the guardianship of his eldest son, afterward Louis IX. The attention given by Blanche to politics had never interfered with the motherly care she bestowed on her children, and the new king, then a pious and good-natured boy, evinced in after life all the virtues of a hero and a saint. Through her title of guardian, she at once assumed the regency, and ruled with such ability that she overcame all the difficulties springing from the ambitious schemes of insubordinate vassals. A formidable league had been formed in the north of France, claiming the regency for young Philip Hurepel, a son of Philip Augustus by Agnes de Meranie. Among the number was Thibault IV., count of Champagne, said to be in love with the queen; she

so adroitly used her influence over the mind, and perhaps the heart of her alleged lover, that she made him the staunchest supporter of her son. She was thus enabled, after a struggle of nearly 4 years, to defeat the confederates. Meanwhile she had secured to the crown the rich inheritance of the counts of Toulouse, by a treaty signed at Paris in 1229; she then forced to submission the unruly duke of Brittany, and helped her friend, the count of Champagne, in taking possession of the kingdom of Navarre. In 1234 she married her beloved son, then 19 years old, to Marguerite of Provence, who was but 12, thus paving the way for the ultimate reunion of that beautiful country with France. When, in 1286, she resigned her power into the hands of Louis IX., the kingdom was in a flourishing condition, and had received many important territorial accessions. The young king, who entertained for his mother the tenderest love and deepest respect, could not but be sensible of her great services, and retained her near him as his best and constant adviser. But with all his condescension to her wisdom, he had a will of his own, as was evidenced by his engaging, against all her remonstrances and entreaties, in a crusade to the Holy Land. She wept bitterly on their parting, as if she felt that they were not to meet again. She now resumed the duties of regent, and displayed her wonted ability among the new difficulties she had to encounter. The defeat and captivity of her son in Egypt was a bitter grief to her; while the necessity of paying his ransom, and sending him money for his journey to Palestine, obliged her, however reluctant, to lay heavy taxes upon the people. She had beside to suppress, by somewhat cruel measures, the revolt of the poor *Pastoureaux*, which was also a severe trial to her feelings. Notwithstanding her piety, she kept free from the sway of the clergy, and did not hesitate to restrain the encroachments of that powerful body. Her death caused universal mourning.

BLAND, JOHN, a martyr in the reign of queen Mary, burned at Canterbury, July 12, 1555, with another clergyman and 2 laymen, boldly admitting the charges made against him of denying the corporal presence, the propriety of celebrating the sacrament in an unknown tongue, and in one kind only to laymen.

BLAND, COL. THEODORE, a Virginia patriot, was born in Prince George county, Va., in 1742, died in New York, June 1, 1790. Through his grandmother, Jane Rolfe, he was fourth in descent from Pocahontas. At an early age he was sent to England, where, at Wakefield, the scene of Goldsmith's "Vicar," and afterward at Edinburgh, he pursued his academical and medical studies with success. Together with Drs. Lee, Field, Blair, Gilmer, and Bankhead, his fellow-students, he drew up a petition to the Virginia house of burgesses, to enact a law forbidding any person to practise medicine in the colony without a proper license. Soon afterward, in 1764 or '65, Dr. Bland re-

turned to Virginia, and, marrying Miss Dangerfield, of the "Northern Neck," commenced the practice of his profession, which he assiduously pursued to the opening of the revolution. Abandoning medicine, he at once enlisted in the contest, in all the struggles of which he bore an active and prominent part. He was one of a score of gentlemen who removed from Lord Dunmore's palace the arms and ammunition which that nobleman had abstracted from the public arsenal; and soon afterward he published a series of bitterly indignant letters against the governor, under the signature of "Cassius," in which his excellency was charged with "giving currency to lies," holding "lewd and nightly orgies with negroes in his palace," and oppressing the colony generally. Col. Bland was made captain of the first troop of Virginia cavalry, but when 6 companies were enrolled, became lieutenant-colonel, with which rank he joined the main army in 1777. With the exception of a single term in the senate of Virginia, he remained in military service to the end of the war, enjoying the high esteem and confidence of Washington, who frequently employed him in responsible affairs. Among other trusts confided to him, was the command of the prisoners taken at Saratoga, when they were marched to Charlottesville, Va. Upon the termination of the revolutionary contest, he was elected a member of the general congress, which then sat at Philadelphia. Here his mansion was the resort of Washington, Lafayette, M. de Noailles, M. de Dumas, and many of the most distinguished men of the epoch. He continued in congress until 1783, when he returned to Virginia. He was elected a member of the convention of 1788 to ratify the federal constitution, against which he voted, but was chosen as the first representative to congress under that instrument. He died at New York, where that body was then sitting, at the age of 48. Dr. Bland was greatly prized for his social accomplishments, which set off an elegant and imposing person. He was tall, his countenance noble, his manners dignified and full of well-bred repose. In his public and private character, all his actions were characterized by rigid integrity, and unfaltering devotion to principle and duty.

BLANDRATA, GIOSEIO, one of the founders of Unitarianism in Poland and Transylvania, born in the marquisate of Saluzzo, in Piedmont, in the first part of the 16th century, died about 1590. A physician by profession, he united great talent with great personal advantages, which endeared him to a numerous circle of friends at Pavia, where he resided for some time. Having embraced the doctrines of the reformation, he retired to Geneva, but having manifested anti-Trinitarian opinions, he soon found the religious atmosphere of Switzerland equally uncongenial, and first repaired to Germany and subsequently to Poland. Notwithstanding the admonition of Calvin, he was received with distinction, and gained such credit among the Protestants of Poland, that he was

elected one of the superintendents of the Helvetic churches of Little Poland. This gave him great facilities for spreading his opinions, and the reformed churches of Poland seemed to be in the way of being wholly pervaded by the fast spreading anti-Trinitarianism. More cautious than Stancor, and other religious reformers, he feigned to subscribe to the Calvinist creed, and made an apology for his belief at the synod of Xionz. In vain were all the endeavors of Calvin to expose the insincerity of his professions. The Italian, instead of being considered as a heretic, found many followers among the most eminent personages, and among others, Prince Radziwil, who appointed him as his plenipotentiary to the synod of Pinczow in 1561. Having accepted the place of physician to John Sigismund, prince of Transylvania, in 1568, Gregorius Pauli, of Brzeziny, became his successor in Poland, and gave to the anti-Trinitarian doctrines a more complete development, while Blandrata now aimed at propagating his views in Transylvania. He succeeded in causing the prince and the court to embrace his doctrines, and at a diet held in 1571 at Maros-Vasarhely, Unitarianism was legally recognized as one of the religions of the land. This took place after a public disputation which he had held, in conjunction with Davidis, a celebrated Unitarian divine, against the Lutheran ministers at Weissenburg, and which lasted 10 days. After the death of John Sigismund, he returned to Poland, and was physician to Stephan and Christopher Bathori, the rank of privy councillor being conferred upon him after Stephan's accession to the throne of Poland. The Bathoris, although not peculiarly favorable to Unitarianism, were unable to prevent the growth of the new doctrines. The denomination increased in power and influence all over the country, and especially numerous were the congregations in the Transylvanian towns of Weissenburg and Klausenburg. The rights and privileges which the Transylvanian Unitarians enjoy at the present day, are thus all to be traced to the seed sown by Blandrata and his fellow-laborers. Blandrata, however, seems to have been swayed by worldly considerations in the latter part of his life, and to the great consternation of his friend Faustus Socinus, and of the other adherents of his church, he endeavored to ingratiate himself with King Stephan, and to augment his fortunes by abandoning his former religious grounds. He finally met with a violent death from the hand of his own nephew, who was supposed to have been instigated by mercenary motives, as he was afraid lest the religious differences between him and his uncle might alienate from him the latter's large property, which he considered himself entitled to inherit. Henke published in 1795, *G. Blandrata confessio Antitrinitaria ejusque confutatio, auctore Matthia Flacio*.

BLANE, SIR GILBERT, an English physician, born in Ayrshire, Scotland, Aug. 29, 1749,

died June 26, 1834. Through the recommendation of Dr. Wm. Hunter, of London, he became private physician, first to Lord Holderness, and then to Admiral Lord Rodney, who, for his gallant conduct during an engagement, made him physician to the fleet. In 1788 he received a pension from the crown, and published "Observations on the Diseases of Seamen." In the West Indies he obtained the friendship of Prince William Henry (afterward William IV.), then a midshipman under Lord Rodney, and this greatly advanced him in his professional career, obtaining him large private practice, and the presidency of the naval medical board. He wrote a variety of tracts and pamphlets on medical subjects, and on the best mode of preserving public health. In 1812 he was made a baronet.

BLANGINI, GIUSEPPE MARCO MARIA FELICE, a musical composer, was born in Turin in 1781, and died in Paris, Dec. 1841. At 12 he was organist of the cathedral in that city, and at 14 led a mass with a full orchestra. He went to Paris in 1799, and was for several years a successful composer of opera there. His fame, however, rests chiefly on his smaller pieces, which were received with much favor, especially in Germany, where he officiated for some time as chapelmaster at the courts of the elector of the Bavarian Palatinate, and of the king of Westphalia.

BLANK VERSE, verse without rhyme or the consonance of final syllables. All the Greek and Latin verse is of this species. Rhyme was the native growth of the heroic and primitive literature of the northern barbarians. During the dark ages not only did rhyme preserve its monopoly over the vernacular languages of Europe, but even intruded itself into the Latin. Gonsalvo Perez, a Spaniard, the secretary of state to the emperor Charles V., and afterward to Philip II., brought blank verse into European notice by translating Homer's "Odyssey" into the Spanish with that metre. Felice Figliucci, in his Italian commentary on the ethics of Aristotle, published 1551, declaims against the Gothic barbarity of rhyme, says that it is unworthy of the favor of a son of Italy, and puts his precepts into practice by translating the quotations from Euripides and Homer which are found in Aristotle into Italian verse without rhyme. In 1547 and 1548, Trissino published his *Italia Liberata di Gotti*, in blank verse. Yet from the nature of the language, and inasmuch as Dante and the great Italian poets of the middle ages had all used rhyme, Italy has not been favorable to the growth of a blank verse literature. Trissino is generally recognized as the introducer of blank verse into the modern Italian, and it is said composed the tragedy of *Sofonisba* as early as 1524. In the French language Jodelle and De Baif, who lived in the second quarter of the 16th century, composed in blank verse. Nicholas Rapin, who lived at the end of the 16th century, was a fanatical worshipper of

blank verse. He declared that it was his wish to extirpate rhyme. De la Motte le Vayer in the age of Louis XIV. wrote in it, but generally speaking the French ear abhors blank verse. The first English blank verse was the "Fourth Boke of Virgill intreating of the Loue betwene Æneas and Dido; translated into Englishe, and drawen into straunge metre" (Lond. 1557), by Lord Surrey. This book must have been composed more than 10 years previously, as Lord Surrey was executed in 1547. Nicholas Grimalde followed Surrey with great success. The first theatrical piece in blank verse was Lord Sackville's tragedy of "Gorboduc" (1561). When Shakespeare began to write his dramas, the popular ear had grown quite familiar with the use of this metre. Blank verse did not flourish much off the stage in English literature until Milton's "Paradise Lost" (1667) vindicated its capabilities. In the preface to the second edition of the poem Milton says: "This neglect of rhyme is so little to be taken for a defect, though it may seem so perhaps to vulgar readers, that it is rather to be esteemed an example set, the first in English, of ancient liberty recovered to heroic poem from the troublesome and modern bondage of rhyming. . . . Some both Italian and Spanish poets of prime note have rejected rhyme both in longer and shorter works, as have also long since our best English tragedies." Longfellow's "Evangeline" is perhaps the most favorable example of the hexameter, a species of blank verse to which the English language does not take kindly. The German, of all the languages of modern Europe, admits the greatest variety of blank verse measures. The 10 syllable heroic pervades the dramas of Schiller and Goethe, as

Die schönen Tage von Aranjuez;

but in Germany not one, but every species of ancient Greek and Roman metre has taken root. The phrase blank verse is of English origin. The Italians call it *verso sciolti*, that is, loosened or emancipated verse. The oldest example of the use of the phrase is in Shakespeare: "The lady shall say her mind freely, or the blank verse shall halt for it."

BLANKENBURG, a province of Brunswick, in Germany; area 178 sq. m.; pop. in 1857, 22,479. The southern part of it, bordering on the Hartz mountains, contains valuable iron mines and marble quarries. Louis XVIII., on his flight from Dillingen, resorted to the capital of Blankenburg, a town of 8,500 inhabitants, which bears the same name, and resided there from Aug. 24, 1796, to Feb. 10, 1798, under the name of Comte de Lille.

BLANQUI, JÉROŔME ADOLPHE, a distinguished political economist of France, born at Nice, Nov. 20, 1798, died in Paris, Jan. 28, 1854. His father, Jean Dominique, formerly a deputy to the national convention, one of the 73 imprisoned in 1793, for protesting against a measure of the Jacobins, afterward a member of the council of five hundred, and a

sub-prefect under Napoleon, devoted much care and time to his early education. He was originally destined to the study of medicine, but his love for general letters caused him to turn his attention to other pursuits. For a while he was a sub-professor in a boarding-school, when he removed to Paris, and made the acquaintance of Jean Baptiste Say, then a renowned teacher of political economy. Through him, the studies of Blanqui were turned in the direction of that subject, and he made it the pursuit of his life. In 1826, a *Résumé* of the history of commerce and industry was the first fruits of his labors. It was speedily followed by a *Précis élémentaire d'économie politique*, and several minor publications, including accounts of voyages to England and to Spain. In 1880 he was chosen a professor in the special school of commerce, where his course in the history of commerce and industrial civilization attracted unusual attention. When Say retired from his professorship in the *conservatoire des arts et métiers*, Blanqui succeeded to his place. In 1837-'42 he issued his most important work, *Histoire de l'économie politique en Europe depuis les anciens jusqu'à nos jours*, which was a succinct but clear and intelligent review of the movements of industry from the earliest time, and of the teachings of the great writers in regard to the laws of trade. The peculiarities of the work were, that the author did not begin his history with Adam Smith or the old French physiocrats, as if the ancients were wholly ignorant of the subject, but with the earliest nations and the earliest writers, while he was also sufficiently comprehensive to recognize the scientific position of the socialist school of speculators. Attaching himself to the class of thinkers which adopts the system of free trade, he was yet disposed to do justice to thinkers of another class. In 1846-'48, Blanqui sat as a member of the chamber of deputies from Bordeaux. At the industrial congress which assembled in Brussels, during the year 1847, his discourses were remarked for their mingled vivacity and learning.—Louis AUGUSTE, a socialistic and revolutionary agitator, brother of the preceding, born at Nice in 1805. Early initiated in the secret societies of that country, he strongly imbibed the communistic and republican doctrines, which he has made it the business of his life to assert. His first public appearance was after the elections of 1827 in Paris, when the royal troops fired upon the populace in order to quell a transient political disturbance, and Blanqui was among the wounded. In 1830, while yet a student of law, he took up arms on the popular side, against the rule of Charles X., and for his bravery and spirit afterward received the decoration of July. Under the government of Louis Philippe, he prosecuted a fervent contest, by means of pamphlets and articles in the liberal papers, against the *bourgeoisie*, or trading classes. A member of the club called *la société des amis du peuple*, he became one of the most active propagators

of the doctrines which led to the revolution of 1848. A discourse pronounced before this society in 1885 directed the attention of the government to him, when he was arrested, tried, and sentenced to 1 year's imprisonment, and a fine of 200 francs. A few months later, being suspected of complicity with Fieschi, who discharged the infernal machine at the king, he was again arrested, sent to prison for 2 years, and fined 8,000 francs. He was amnestied before the expiration of his term, although a return to Paris was interdicted. As soon as he was released, he began the organization of an immense affiliated association, which, under the names of *société des saisons* and *les montagnards*, renewed the anti-monarchical propaganda. The members of these were supposed to amount to 1,000,000 in number. With Barbès and others, he attempted a revolution at Paris, in May, 1839. It failed, and Blanqui was seized and condemned to death; but again his punishment was commuted to perpetual imprisonment. The revolution of Feb. 1848, freed him from his fetters, and he became a leader of the people. The insurrection of May 15 was organized by him, and, at the head of a large body of delegates, he marched to the hall of the national assembly, to inaugurate, if possible, a more effective government; but he was overpowered by the troops under Changarnier, placed once more under arrest, and, upon trial, remanded to prison for 10 years.

BLARNEY, a small village in the south of Ireland, 4 miles distant from the city of Cork. Its surrounding scenery is beautiful, but it is chiefly visited on account of its castle, celebrated in song and legend. This antique pile formerly belonged to the Mac Carthy family, until forfeited, in 1689, by Lord Clancarty, when it was purchased by an ancestor of Mr. Jeffreys, the present owner. It stands on the north side of a precipitous ridge of limestone rock, rising from a deep valley, and part of its base is washed by a small and beautifully clear river called the Aw-Martin. Near it are the famous groves of Blarney—literally a thick shrubbery of large laurel trees. Of the original fortress there remains only a large, square, massive tower—a sort of keep. The top of this is surrounded with a parapet, breast high, and on the summit is the famous stone, which is said to confer on the person kissing it the peculiar property of saying anything, by way of coaxing, compliment, or praise, most agreeable to the hearer. From the virtue it thus communicates, the well-known word blarney is derived. Various are the traditions respecting the origin of this term. The most plausible (related by Crofton Croker) declares that in 1602, when the Spaniards were exciting the Irish chieftains to harass the English authorities, Cormac McDermod Carthy held, among other dependencies, the castle of Blarney, and had concluded an armistice with the lord president, on condition of surrendering this fort to an English garrison.

Day after day did his lordship look for the fulfilment of this compact, while the Irish chief continually put him off with soft promises and delusive delays, until, at last, the lord president became the laughing-stock of Queen Elizabeth's ministers, and Blarney talk proverbial. In the "Prout Papers" is an amusing attempt to show that the Blarney stone (described as "the palladium of Ireland") was originally brought over by the Phœnician colony who are said to have peopled that island, and that, indeed, the inhabitants of Tyre and Carthage, who long were its custodians, made great use of the privilege, as the proverbs, *Punica fides*, *Tyriosque bilingues*, clearly testify; that a body of Carthaginian adventurers stole away the stone to Minorca (where Port Mahon was settled by the clan of the O'Mahonys), and afterward, driven into Cork harbor, deposited the treasure in the present spot, and the shadiest groves of its vicinity; and that the famous song, "The Groves of Blarney," instead of being an original composition, was translated from the Greek! The actual Blarney stone is not the one commonly saluted as such, but is said to form part of the wall several feet below its representative, and only to be touched by the lips by the person being held over the parapet by the heels—an operation so dangerous and unpleasant as rarely to be resorted to. It is believed, in Ireland, that a shot from one of Cromwell's cannon loosened the stone; but it is doubtful whether Cromwell ever visited Blarney, and it was Lord Broghill who became master of the castle in 1646. Mr. Richard Alfred Milliken, a poetical lawyer of Cork, being struck with the amusing extravagance of some doggerel rhymes composed by an itinerant cobbler, in favor of Castle Hyde, near Fermoy—in which he spoke of

The trout and the salmon  
A-playing backgammon,  
All by the banks of sweet Castle Hyde—

wrote "The Groves of Blarney," as a burlesque, in the same metre, about the year 1798 or 1799. In the following year it was heard, at Cork, by the late Mr. Mathews, the comedian, who sang it frequently at private parties. It was afterward sung on the stage, and by none more effectively than the late Tyrone Power. Peculiar suavity of speech is the presumed virtue derived from kissing the Blarney stone. What is called impudence is said to be bestowed (when not naturally and nationally inherited) by a dip in the river Shannon, a ceremony probably traceable to the dipping of Achilles in the Styx. Among the many pilgrimages to Blarney, none was more memorable than that of Sir Walter Scott (accompanied by his daughter, Miss Edgeworth, and Mr. Lockhart), in 1825. They had a right mirthful picnic among the groves, says Lockhart, and "Sir Walter scrambled up to the top of the castle, and kissed, with due faith and devotion, the famous Blarney stone, one salute of which is said to emancipate the pilgrim from all future visitations of *mauvaise honte*."

**BLASPHEMY** (Gr. *βλασφηημα*), impious speaking or writing concerning sacred things, which includes not merely profane use of the name of God, but any scoffing or scurrilous language in respect to the commonly received doctrines of religion. In the Mosaic laws, blasphemy was any thing irreverent of Jehovah. The name was not to be spoken except in religious services, nor was the name of any heathen god. The case referred to in Lev. xxiv. 11, seems to have been an improper use of the prohibited name, though in a different sense from what is intended in the 2d commandment. The latter refers to a trifling or inconsiderate use of the name of God—the other more particularly has reference to such language as expressed disbelief in God, or his attributes; and this is the proper distinction between blasphemy and profane swearing. The punishment by the Jewish law was death. In the time of our Saviour, it appears to have been considered blasphemy to claim divine power (Matt. ix. 3, John x. 33). Paul called himself a blasphemer before his conversion (1 Tim. i. 13). The same word which in the Greek is used for blasphemy, is sometimes translated "railing" (1 Tim. vi. 4). In Roman Catholic countries, not only irreverent language respecting God or Christ, but avowal of disbelief in certain articles of faith or popular tenets, has been held to be blasphemy, and punished by the civil power as a crime. By the common law of England, blasphemy is indictable as a criminal offence, and it is defined to be a denial of the being or providence of God, contumelious language respecting Christ, or profane scoffing at the holy Scriptures. This was so held on the ground that the Christian religion is a part of the laws of England. A publication containing scurrilous or contemptuous language respecting our Saviour has been held to be a libel at common law; and as a general principle it has been adjudged to be unlawful to write against Christianity in general, or against its doctrines, if there be apparent a design to undermine it altogether, but that it is allowable to write upon controverted points in a decorous manner, even though some articles of faith held by the church of England should be affected. In the United States the Christian religion has been received as a part of the common law, and blasphemy is consequently a criminal offence. In some of the New England states, and perhaps in some others, there have been statutes regulating the punishment, but practically they are inoperative, and the cases have been rare of any proceedings under them. In the state of New York it has been held that whatever tends to impair public respect for the Christian religion, is subversive of civil society, and that indecorous language, whether spoken or written, offensive to the general religious tone of feeling of the community, is an indictable offence, while at the same time it is conceded that there is liberty of controverting any matter of doctrine, so that it be done in a proper manner.
